When is Diathermy of Value in Your Practice?

YOUR decision to use diathermy in the treatment of any condition will, of course, be based on recognized medical authority. Many physicians have become interested as a result of observing the many references to diathermy in current medical literature, and no doubt intend to investigate for themselves when opportunity presents But a busy practice affords little of the time required in search ing the files of the medical library, and it is put off indefinitely

A preliminary survey of the articles on diathermy, published during the past year or so, is available to you in the form of a 64 page booklet entitled "Indications for Diathermy." In this booklet you will find over 250 abstracts and ex tracts from articles by American and foreign authorities, including references to more than a hundred conditions, in the treatment of which the use of diathermy is discussed.

If you number yourself among the physicians who have not adopted diathermy in practice, and desire to investigate this form of therapy in view of reaching your own conclusion as to its value in your practice, you will find this booklet a convement reference

A copy will be sent on request

# MEDICAL SOCIETY OF THE STATE OF NEW YORK ANNUAL REPORTS, 1929-1930

#### REPORT OF THE PRESIDENT

To the House of Delegates— Gentlemen:

Your President begs leave to submit his report for the past year, and after study and the experiences of his term in office to make certain recommendations for discussion and decision, which may improve the Society's efforts to aid the individual practitioner in his local problems, and to strengthen the Society as a whole in advancing the cause of bringing better health and a longer lease of life to the populace of this State.

Unfortunately he was afflicted with illness in the forepart of 1930 which forbade his visiting the County Societies in as great a number as he had hoped and planned to do, and necessarily some work was curtailed or even not touched upon, but the willingness so to do must be accepted with the sorrow that the program as planned could not be entirely carried out.

It is probably so each year in our lives, and therefore his successor must carry on in behalf of what is believed to be for the good of the citizenry.

The various Standing and Special Committees have nobly striven to fulfill their duties as they have understood them, and the Officers and Executives of the Society have carried on in the same high measure that has made the Society so proud of them in the past.

Attention should be called to the fact that more and more is being demanded of your officers and committeemen through the complexities of the life and period in which we are living, and the evolution of the practice of medicine is pointing in several very definite directions.

During this past year it has been a pleasure to note that our Committee on Public Relations has established very definite connections with the governmental and lay agencies, wherein it has been the more firmly established that the ultimate foundation of successful public health

measures must rest upon the shoulders of the individual doctor in carrying out detailed programs, and that no group or organization can so successfully reach the individual as can the family practitioner when he fulfills the whole measure of his duty.

To him must we look as the ultimate agent of all groups, and conversely should he look to his organized medical body for guidance and principles.

### Review of Committee and Officers

The various phases of mass preventive and curative medicine have been well cared for by your Society in such matters as Diphtheria Immunization, Periodic Health Examinations, the Economics of Medicine, Physio-therapy now just coming to the fore, and the other matters which touch upon the relationship of the doctor as an individual and as to his membership in the Society and with the Public. It is a slow and tedious process of education.

Your Committee on Public Health and Medical Education, which has had to do largely with the physician himself and his attitude toward his own education, that he may strive individually to be in the forefront with knowledge and advice, has made marvellous strides during the year.

Your Legislative Committee, through careful and considerate contact with the legislative and executive branches of the State Government, and tactful work of your Executive Officer working under it, has maintained thoughtful and progressive action on the part of legislators who are slowly coming to the belief that the doctor as an individual and in our groupings is solely interested in maintaining a high standard in medical education, and in the practice of medicine for the protection of the health of the public

Your Committee on Grievances, though not a Medical Society body, has assisted the State

Education Department in this latter regard to a degree that was not contemplated when first it was created.

That our cry was heard throughout the State as to the necessity of a physician in the Board of Regents to advise in medical and health matters is evidenced by the very heartening election of Dr. Grant C. Madill to a vacancy on that Board.

Much else might be mentioned specifically. Of the recommendations made by the past president, there are none which have not been carefully considered and decisions made thereon as well as all of the matters which were referred by your House of Delegates to the Council and to the Executive Committee.

We have been unfortunate in the loss by resignation of our Counsel, Mr. Lloyd P. Stryker, who has so ably and valiantly carried on the legal department of the Society, but who desires to enter on a larger field of work. Happy are we, however, to note that his love for the work is of such a character that he has desired to be carried on our rolls as Consulting Counsel without compensation and will still give us of his rich experience.

Our new Counsel, Mr. Brosman, is entirely familiar with what is required, through his association of many years with Mr. Stryker and having been the Society's Attorney in the past.

Our funds have been safeguarded through our economical and militant Board of Trustees, our expenses have not been lavish, but well within bounds.

I believe we may say that great progress in all lines of endeavor marks the years' work, but there is no lack of opportunity for greater development in this march of progress, even within our own medical circle.

There are certain general topics I wish to speak of from my observations as President this past year.

# Woman's Auxiliary

I believe we are losing much valuable assistance, especially politically and legislatively, in decrying a Woman's Auxiliary. We have none and it is our own fault. Our neighbors, Pennsylvania and New Jersey, have profited much therefrom.

We could well use a graduate female physician or nurse to work from a central headquarters and be the contact between female groups and our State Society. Apparently we have never utilized cooperation with the Women's Medical Society of this State, further then that your incoming President, by invitation, addresses them each year when they meet in the same city and at the same time as we do. A good tactful woman as a field secretary, or whatever you wish to call her, can do much good as is seen in the New Jersey Medical Society and in others.

# Cancer Prevention

We have not, as a Society, put our shoulders to the wheel in the Cancer Prevention Work. What if it is supervised by another group semimedical, but yet surely ethical and sincere. Another instance which points to our being behind in effort. We surely should become interested in it and have some special group amidst our own State organization as well as the scattered ones in County Societies which are now being organized by their well-meaning and well-informed medical assisters of the Cancer Prevention organization.

# Advance Program of Executive Committee Meetings

I think the meetings of our Council and Executive Committee members should be informed at least one week in advance of every question which is to come before them for deliberation and not enter a meeting where decisions are sometimes made without much discussion. This is not a criticism of any individuals but is a desire to see the Society take a forward step in debating at greater length, some of the questions of moment which have come up and has been suggested to me as President a number of times to bring before you.

# Historical Records and Rules

There is again brought to the fore the proposition of a new State Museum building in Albany, wherein might be housed a wonderful collection of various articles portraying the history of medicine in this State and perhaps in this country.

The Director of the Museum is anxious to assemble such a collection and I would offer the suggestion that a special committee might be appointed whose duty it would be to obtain old instruments, books and implements, etc., during the coming summer and arrange with the Director for such to be put on display as a "Collection loaned by the Medical Society of the State of New York," and by individual members.

Many of our County Societies have old records, which are now subject to fire hazards. These should be housed perhaps in a central fireproof vault. Or at least copies of them should be made and sent to our Secretary's office for future preservation.

# Vice-President and Executive Committee

In view of the increasing complexities in the practice of medicine, and from my experiences of the past year I would recommend to the Society, through its House of Delegates, the serious consideration and action of the following:—

1. When the President is ill, or unable to perform a duty, as when several engagements fall upon the same date, your By-Laws in Chapter

8, Section 2, state that the ranking Vice-President shall perform the duties of the President.

As it is not provided in any place that he shall attend the Executive Committee meetings, he is therefore, out of touch with the immediate activities of the Society and with the new principles and orders of procedures being constastly formulated from month to month.

I would therefore, recommend that a change be made in the By-Laws and that the ranking Vice-President (as is now the case with the President-elect) shall be required to attend the Executive Committee meetings without voice or vote.

#### Censors

2. From time to time the Board of Censors of the State Society is called together on the request of a member of the Society to hear an appeal from that member from a decision of his local County Society Board of Censors.

The cost of gathering together the Councillors (Presidents of the District Branches) and the officers to constitute the Board of Censors under Article 7 of the Constitution may amount to a considerable sum, and as they must gather from all parts of the State it would seem but reasonable that the common ruling of law be applied that a bond be posted by him who was appealing from the decision of his County Society, as an evidence of good faith.

Recently your Censors met to act on an appeal and the notices were issued to the Censors and to the appellant and to the defendant several weeks in advance. On the morning of the appeal and only three hours before the Censors were to meet, the appellant informed the Secretary of the Board of Censors that neither he nor his counsel would appear. This unwarranted cost of money to the Society, and time wasted (which means money) by active physicians from various parts of the State should not be.

I therefore, recommend that in counsel, with our Counsel, a clause be inserted in Chapter IX of the By-Laws, in Article 2 or 3 whereby a bond must be posted by the appellant, and in case of his non-appearance, the expense of the meeting shall be borne by him from said bond.

It is not intended to penalize him who honestly wishes to be heard by appeal and so, if the appeal is heard, no matter what the decision the wording should indicate that where the meeting was held and the appellant appeared personally or by counsel and was heard, his bond should be returned to him and no costs should be levied on either party.

# Reports of House of Delegates

3. As it is many weeks before the members of the Society learn what has been done in the meetings of their House of Delegates, and as I have had verbal criticism throughout the State by members as to their inability to learn what has taken place at the very meeting which they are attending, until a long time after, I would suggest that consideration be given to the following question:

As the House of Delegates has practically finished its work at the hour of the Annual Meeting of the Society, I ask if it would not be a forward step if the Speaker of the House, or his representative the Vice-Speaker, give a short written résumé of what has occurred at the meetings of the House of Delegates, to the members attending the Annual Meeting. Thereby these members could carry back with them to their component County Societies at least an idea of what had been accomplished in the House of Delegates and so hearten many of the County Societies, who need leavening, and give them an idea of policies to be followed in the coming year, as well as questions which have been referred to the Council or Executive Committee for decision during the year to come, and so tending to keep the County Societies more active and alive between the yearly meetings of the whole Society.

#### Expenses of Officers and Committeemen

4. It does not seem fair now, to ask the officers of the Society, or members of Committees, to be absent from their homes in attendance upon duties of the Society and to be provided only with their carfare while having to pay their hotel bills, etc., from their own pocket. To be interested in Society matters and to be working for the members of the Society earnestly and honestly, at present imposes not alone a time tax, but also a monetary tax on many of your officers, principally committee members.

It seems to me that our Society could well afford to reimburse those earnest and hard working members who plan and direct the various efforts of the Society, which same are constantly becoming more burdensome, in whole or in part for their actual and needed expenses, paid out while on actual Society work.

A per diem allowance is now made to certain officers when on actual Society business, but I believe it is only fair that some allowance should now be set up and instituted for all.

I would therefore, recommend that this matter be referred to the Board of Trustees for consideration, adjustment and action with a view toward reimbursing those who are on Society business, for their hotel and other actual necessary expenses, and that the Council insert this in the next budget.

And that the House of Delegates, or by its reference, the Council make the necessary changes in Chapter 7 of the By-Laws as required to make this possible.

# The Formal Annual Meeting

5. This Society does not hold a real Annual Meeting at which a large percentage of its members present in the city at the time attend the same.

Usually the Annual Meeting is an evening perfunctory gathering with a few addresses, followed by a social gathering wherein an admission fee is charged. This makes for a division in our membership and an ever-increasing problem to the local committee of the city wherein is held the meeting.

Our Annual Meeting could be held in a very few minutes, constituted as we are by law and our Constitution and By-Laws.

I would suggest that the Council be directed to so bring it about that,

(a) By amendment or resolution the Annual Meeting shall be held at noon, or some other designated daylight hour and that the next meeting for 1931 shall partake more of the spirit of Chapter XI of our By-Laws. Thus can we attempt to bring into our general meeting of the Society a better understanding and a hoped for participation on the part of the members of the Society who are not serving on Special Committees, or in the House of Delegates during the meeting and who therefore, may express themselves in an open and general Society meeting.

# Annual Banquet

(b) I believe it would create a wonderful spirit among those present in the city at the time of the Annual session, and would increase the attendance at the section and general meetings, if the Society in general held a banquet on one of the evenings during the session which would be tendered by the Society to all who had registered, and without expense to the individuals attending.

Year after year, we who have served on Committees of Arrangements know the unpleasant situation when the discussion comes up concerning the type of entertainment to be given and the worries that ensue therefrom as to the expense thereby incurred.

I believe the Society owes its members at least once yearly a general social gathering to be provided by the Society to those who have sufficient interest in the Society and in medicine in general to travel long distances and to forfeit their practice for the days of the meetings.

I would therefore suggest that the House of Delegates recommend to the Board of Trustees that a sufficient sum be appropriated in the next budget, perhaps \$2,000.00, or so much therefore, as is necessary, to provide a social evening including a banquet of simple nature perhaps, as a trial for our next Annual session. And that such an evening shall be planned by the Ex-

ecutive Committee who shall govern the expenditure therefor, in connection with the Committee on Arrangements. That each member who registers for the sessions of the Society shall be entitled to receive one ticket gratis and may purchase additional tickets for guests at a sum to be determined by the Executive Committee.

# Secretaries and Legislative Chairmen's Meetings

6. Our meeting of Legistlative chairmen, during the winter, and our Secretaries' meeting have brought forth much of value to the Society in the questions which have been debated and the principles enunciated and to be followed in the everchanging local and State conditions relating to medical practice.

I suggest that the House of Delegates again recommend to the Board of Trustees that the appropriations in sufficient amounts again be made for holding these meetings or conferences. There should be included therein an amount sufficient to allow those in attendance at least a small per diem for that which each one must spend for hotel bills.

# Tri-State Conference

7. Though there has been discussion as to the value of the Tri-State Conference, which directly may be of little value to the individual member of any component State Society, yet the general good which has seemed to emanate from these gatherings, warrants, I believe, their continuance and I therefore, suggest that the House of Delegates recommend to the Board of Trustees that the sum of \$150.00 be appropriated for our part of the meetings during the coming year, and that it be considered a part of the regular Society affairs.

I realize that the Conference is rather a loosely bound affair and would therefore, in addition, recommend that the Council or the Executive Committee shall determine by vote what officers shall be designated to attend the Conference. As a suggestion, perhaps those who might be designated should be the President, the Presidentelect, the Secretary, the Editor of the Journal or his designate, and the Executive Officers. Others invited or designing to participate should be taxed a small amount.

# District Branches, Special Committee

8. The District Branches do not function to the full extent, I believe, as was intended when they were first planned. Much work could be done by the District Branch through its officers which would relieve the main officers of the Society, especially the permanent Committee Chairmen of their constant importuning of the County Society Chairmen directly, of which only about 50 per cent function completely.

Through changes in the District Branch formation and added duties, perhaps greater results in benefit to our County Societies and our State body as a whole might accrue

I would therefore, suggest that the House of Delegates recommend to the Council the appointment of a Special Committee to study the District Branch set up as we now have it, looking toward an improvement and changes which could bring greater strength to our individual County Societies, and to the State Society as a whole This Special Committee can study the thought carefully during the coming year, and having perhaps attended the meetings of the District Branches, should render its report to the House of Delegates in 1931 for thorough discussion

The carrying out of many policies enunciated by the House of Delegates, by the Council, or by the Executive Committee could more easily be carried out through the District Branches, than when importuned by the main Secretarial office of the Society, as the "nearer the responsibility is to the individual member, the greater is the likelihood of an action being carried forward"

## Councillors and Executive Committee Meetings

9 In connection with the above there is also to be considered the meetings of the Council, and of the Executive Committee

Your Council has met but twice this last year For about one hour in June 1929, immediately after the Annual Meeting, when many important matters were not discussed, but were perfunctorily passed on to the Executive Committee for discussion and decision, and again in December 1929, in an afternoon session

If it is agreed that two heads are better than one in a decision then I believe ten or more brains in discussing a subject will bring forth more ideas to the better decision

While I have adopted the plan of my predeces sors in office and have not called more frequent meetings, or been asked to do so, it might perhaps be a thought to work upon that

Adopting the idea of utilizing the branch organizations to fulfil their duties the more, there might be held on the morning each month, of the Executive Committee day, or bi mouthly a meeting of the Councillors, who shall report in minute detail the conditions existing in each District Branch of the State and from thence in the afternoon your Executive Committee would have the last word in knowledge and information throughout the State for their meeting in the afternoon, and the Councillors would have had opportunity to exchange ideas and be enthused by their own meeting

Perhaps more meetings of the Council should be held and therein are included the Councillors (Presidents of the District Branches) who might

and who should, report to the Council as to affairs in their individual Districts

#### President-elect

10 At the first session of the Council your President presented an outline of certain aspects in Society work which he thought might better the workings of the Society

This was in the nature of an inaugural address It was the first time such an innovation had been

attempted

Our Constitution and By-Laws make no provision for the President-elect to address the House of Delegates or the general society until after his work is done

Then as President he may only present a report of work accomplished during his year past as President and mike recommendations for bet terment to the Society, which will be referred to a Reference Committee at the Annual Meeting Before this Committee he must appear to amplify and explain his recommendations, which Committee members may be and usually are quite un familiar with the minute details of the Society and therefore, may not be able to give the consideration to the recommendations as might seem wairanted

To be sure the report and recommendations are published in advance but the reasons and arguments cannot be elaborated to the degree which warrant them

The President is busy at an Annual Meeting with a multiplicity of duties and therefore, can not appear before his Reference Committee ordinarily, as he should, to explain his points of view at greater length

The President-elect has presumably attended all the Council and Executive Committee meetings during the year, and has formed some very definite ideas as to how business might better be expedited and certain changes made. But he has voice only by courtesy, and no vote in the Executive Committee. He also has attended many meetings throughout the State as the President-elect and so has been able to feel out the desires of the various groupings in the State and there fore, should have some very concrete ideas of value to give us, and hence a more uniform plan of action can be formulated.

I therefore, propose for discussion the question as to whether it would not be to the gain of the Society to interpolate in Chapter II of the By-Laws, Section 7 page 10, after order No 5, a new order No 6 address of President-elect, and renumber the rest of the section

# Standing Committee on Publicity

11 Our Journal reaches the members of our own Society and some members of other State Medical Societies, but publicity as to what our State Society is doing for the care and prevention

of disease, in public health matters, and in the newer discoveries as to medical science, is not reaching the public through the lay press, bearing the authenticity of our State or County organizations, or through magazines, or authentic talks given by our own membership, lay or medical of our organized medical groups, in the measure in which it should.

This is becoming of vital importance because the lay organizations, especially certain ones, and perhaps governmental groups, have obtained a very great advantage over organized medicine, and through their press bureaus will continue to hold, and even grow stronger in their hold, in propaganda and support of lay people, unless our State Society reaches out to the every-day public, through the press in a dignified manner.

As has been learned in the National Medical group that it was necessary to reach the general public through the publication "Hygeia," I would recommend that our Publication Committee be abolished and in its stead a new Standing Committee take its place, by amending Chapter X, Section 1 of the By-Laws and adding thereto a new Standing Committee to be known as the Committee on Publicity, said Committee to consist of five members, of which the Editor of the Journal shall be one member.

The duties of said Committee to be defined as

ioliows:--

(1) To establish a bureau of publicity in connection with the Journal of the Medical Society of the State of New York, and as a publicity liaison bureau of all of our Society Committees.

(2) To supervise the editing and publishing of our Journal of this Society, in conjunction

with the Editor of the Journal.

(3) To establish a liaison with the newspapers, and magazines, and other publications throughout this State, and where deemed necessary, outside of this State, and furnish them with edited articles, daily or weekly, of what our State Medical Society, or its component parts, is doing in advancing the interests of medicine and public health.

(4) To aid and assist, through the columns so opened to them, in the various committees, statewide or county members in correlating the news activities of organized medicine and see that they

are offered to the lay press.

- (5) To advertise more widely, in general and where given locally, such postgraduate courses as are given by the Society to its members, or where proper, any postgraduate courses of other groups, that the public may acquaint themselves the more as to the activities of organized medicine.
- (6) To issue information when deemed advisable in pamphlets, by letters or by other legitimate means, to physicians, lay people or lay organizations covering such important medical topics as are pertinent.

(7) To undertake the foundation and conduction of a press bureau as above for the syndicating of medical articles, such as are appearing at present in newspapers through the country for commercial gain, and to be prepared to answer such letters and inquiries on medical questions as may be directed to the newspapers, or to medical societies so as to forward proper medical advice and induce such questioners to "consult your own doctor, nearest clinic, or your own County Medical Society."

(8) To establish a bureau of lay and medical speakers, who, gratuitously or for small honorarium will be prepared to furnish such persons with literature and data on general, and if feasible, special medical topics. This portion of their work shall be subservient to the call of the various committees, Public Relations, Public Health and Medical Education, Periodic Health Exam-

inations, etc.

(9) To consider and perhaps start the filing of duplicate reports, for reference, of the different Committees, as rendered monthly to the Executive Committee and Council, for the purpose of utilizing much of this material in our own Journal and in drafting popular articles for the lay press. And in this connection perhaps, to entertain the thought of starting a library of books, films, lantern slides, etc., for illustrating particular subjects in medicine, which could be loaned to the County Societies on special occasions.

This Committee would take the place of our present Special Publication Committee, but with the added duties as its name implies it should try to reach the individual lay person, the unorganized major mass of the people, with proper literature written in simple language and from

the viewpoint of the doctor.

Lay people are the more "medicine conscious" in these years since the war. We are doing only a small part in guiding their education or reading, and are leaving this to organizations who have ideals, at times I fear higher than ours, as exhibited by their efforts, while we supinely stand aside and let them pull or push us about.

We do not in general invite lay people to any of our meetings where medical questions (not politics) are scheduled for discussion but seem to live in the past in keeping this knowledge in

our own little circles.

The work of the organized medical group in this State is interesting and as your President, I have enjoyed giving it my best endeavors.

For the honor bestowed upon me by one and all in elevating me to this office, and for the loyal and conscientious work put forth by my associates, my thanks are but meagre expressions of gratefulness; and I leave the office with the hope that at least we have advanced a few steps along the roads toward the goals which we are seeking.

JAMES N. VANDER VEER,
April 1, 1930. President.

#### REPORT OF THE SECRETARY

To the House of Delegates: Gentlemen:

Again your Secretary has the honor of submitting an annual report,

As in former years, this, in accordance with his assigned duties, must partake necessarily more of the nature of an executive than a secretarial report.

#### THE SOCIETY

When faults and defects exist in the mechanism, it is easy by constructive criticism and suggestion to build up a report on the existing conditions and advance ideas for the correction thereof; but when everything is running smoothly and when the various parts are working in effective harmony, one must remember that it is best to leave well enough alone. Perfection is a relative term and is never attained.

In this respect, the statement made last year applies equally well to conditions of today, "There exists an almost harmonious correlation of all the elements and component units that comprise the corporate body, a considerable lessening of the overlapping and encroachments of duties of officers and committees and a sincere cooperation of all toward the upholding of the ideals and purposes of the Society."

#### THE SOCIETY'S OFFICES

For five years, the improvements advocated by the Secretary upon first assuming the office, have been adopted gradually and without disturbing husiness routine until there now remains little to be done. In making these changes the Secretary has received the support of the Executive Committee and the Board of Trustees and the earnest cooperation of the entire office force under the wise and experienced management of Miss Baldwin whose loyalty to the Society and devotion to duty have been of incalculable value. To her and to his efficient and willing staff, the Secretary takes this opportunity to express his thanks and appreciation.

The problem of space in the office for the meetings of the Council and Executive Committee has been solved by giving the clerks and stenographers an afternoon off when these meetings occur; the Trustees not having been able to provide the extra room. In contra-distinction to this, the Legislative Burcau in Albany, where there is but one employee as compared to from seven to ten in the Society's offices, has been able to obtain a fifty percent increase of floor space. This increase was necessary and obtainable: in the Society's offices this increase is necessary but apparently unobtainable, through lack of room in the Academy building.

#### FINANCIAL DEPARTMENT

The Society is to be congratulated upon having a Treasurer and a Board of Trustees who possess

that element so frequently lacking in the physician —business acumen.

The absolute lack of criticism of the finances of the Society during the past year indicates that the membership at large now realizes the importance of these offices and the worth of the men holding them.

#### LEGAL DEPARTMENT

Through the resignation of Mr. Lloyd P. Stryker as our Counsel the Society has experienced a great loss and to the Secretary the loss has been both official and personal.

During the years Mr. Stryker has been with us the Society has grown to appreciate not only his work but also his personality. He was the friend of every member of the Society, looking upon the physician as a man necessarily of high ideals and character and always judging him as such. He proved himself a man and "to know him was to love him." His regard for the Society is shown by his willingness to serve without fee as Consulting Counsel.

His successor, Mr. Lorenz J. Brosnan, is well known for his work in the many cases in which he has served as trial counsel, and the Secretary has received from time to time messages of thanks and compliment from those whose cases he has handled.

Despite the stress that has been laid upon the limitations of the Counsel's duties in annual reports and in published articles, there still persists a misunderstanding on the part of many. In view of this, it has been thought well to obtain a formal ruling from the Executive Committee regarding these duties.

Copies of the following have been sent to the President and Secretaries of all County Societies: "This misunderstanding has reached such an extent that County Societies, Committees, and individual members are continually requesting legal opinion upon questions of ethics, interpretations of both State and County By-Laws, rulings on internal dissensions and many others of like character together with opinions upon individual affairs which should be referred to private counsel.

"In addition to the duties appertaining to malpractice defense, the Counsel is retained by the Council of the Society as General Counsel and arts in an advisory capacity to the Legislative and Administrative Bodies, i. e., the House of Delegates, the Council and the Executive Committee; rendering service also in such other matters as may be referred to him providing such are consistent with the customary duties of his office.

"All questions or requests for information by Committees, County Societies, or individuals must be referred therefor, through the Secretary's office to the Executive Committee with which Counsel sits."

#### COMMITTEES

Your Secretary has had this year greater opportunity to observe and judge the work of the Committees by reason of having received regular monthly reports and opportunities to sit at their meetings. He extends to them his sincere congratulations.

The excellent service rendered the Society, the Profession and the Public by certain Committees has never been excelled and the enthusiasm, indefatigable energy, keen intelligence, knowledge of their especial sphere of work and their self-sacrificing devotion to their duties should receive the commendation of every member.

The character of the work differs so greatly in the various committees that it casts no reflection upon the others to call especial attention to that of the Committees on Public Relations and on Health and Education. The Committees on Physical Therapy and on Periodic Health Examinations are new Committees but have already made themselves felt in their respective fields. The Committee on Scientific Program continues to live up to the high ideals set by its efficient and energetic chairman. The Secretary still believes that the work of the Committee on Economics should be broadened and made of major importance; several County Societies are far ahead of the State Society in the study of this phase of medical practice.

# CONSTITUTION AND BY-LAWS

The revised Constitution and By-Laws adopted by the 1928 House of Delegates have been effective in eliminating much of the confusion and errors of past years and while perhaps not perfect are to all intents and purposes sufficient for the legal governing of the organization and the forwarding of its work.

Long experience has taught your Secretary that a flexible Constitution and a multiplicity of laws tend to greatly weaken the effectiveness of an organization. Much of the strength of the Society lies in the system of governing by resolutions of the House of Delegates and Council, which resolutions may be temporary or permanent in effect according to the purpose for which they were adopted and the effectiveness of their operation. The Legal Department, the Publication Department and the Insurance Question all show the wisdom of this procedure.

What a chaotic state would ensue if every move had to be in accord with a section of the By-Laws and if every experimental law found to be a failure had to remain in effect for a year or more.

# MEETINGS AND CONFERENCES

The Conference of County Secretaries held in Albany last fall evidenced by the attendance, the interest shown by those present and their earnest entrance into discussion of the many ideas ad-

vanced for the betterment of the County Society, that the re-establishment of these conferences was well worth while. It is the hope of your Secretary that they be made a permanent annual feature.

The Secretary attended the afternoon session of the Tri-State Conference and was astonished to find New York represented by but one officer, the President Elect; the others being a former President who happened to be stopping at the hotel, the Executive Officer and the Executive Editor. While the worth of these conferences is questionable, there is no reason why the Society should be represented, if at all, in a loose haphazard way. No official action regarding representation ever has been taken and those who attend, do so at considerable loss of time and at their own expense. No recommendation is offered, the solution being obvious.

The occasional inter-committee conferences have proved exceedingly interesting and of great value, one commendable feature being the presence, by invitation, of State officers who are thus kept in touch with the Society's activities. Succeeding chairmen should continue this custom.

Occasional comments are heard regarding the infrequent meetings of the House of Delegates and of the Council, the House being required to hold annually but one meeting and the Council two.

In this connection, it should be remembered that the House is the Legislative Body of the Society and the Council the Executive and Administrative Body, delegating its powers to a smaller and more workable body, the Executive Committee. Anyone at all familiar with the conduct of business concerns or governments will realize that this is the only logical and efficient scheme. small committee, selected for their interest in and knowledge of the affairs of the Society can accomplish more and better work than a larger general committee is an indisputable fact. Council consists of 31 members, six of whom have duties in specific spheres of activities and seven members constitute a quorum. Executive Committee is composed of nine members of the Council, two more than a quorum. and is therefor in every way representative and sufficient.

# DISTRICT BRANCHES AND COUNCILLORS

The Secretary was able to visit but six of the District Meetings and extends his thanks to their officers and members for the hospitality and courtesy afforded him. He expresses his regrets at not being able to attend the meetings of the Fifth and Fighth Districts.

The worth of the plan adopted several verre ago of placing the programs and arrangements of each District in the hands of an Executive Committee with the collaboration of the Execu-

tive Officer is shown by the annual increase in attendance and interest. Having observed the workings of three different forms of District Government, the Secretary heartily commends the

present system

He has however, one comment to make occasionally happens that someone is elected President of a District who does not realize the seriousness and importance of the duties which he is assuming The President is a Councillor of the Society and as such is one of its principal officers He is a member of the Council and a Censor and one-third of the Executive Committee is composed of Councillors According to the provisions of the By Laws he must visit the Counties of his District at least once a year, make a careful inquiry of the condition of the Profes sion and report thereon to the House of Dele These are no light tasks and the Secretary is of the opinion that the expenses incurred in carrying them out should be borne by the Society

#### IN GENERAL

The Secretary calls the attention of the House to the recommendation of the Council that more care be exercised in instituting special committees whose duties may lie within the province of one of the committees already instituted

Also to the recommendation in the Secretary's report of 1928 that some plan should be devised whereby the work of the Reference Committees could be so handled as to expedite the business of the House and avoid the jamming through at the last moment of amendments and important business without discussion

He again sitesses the importance of finishing all business and abandoning the habit of referring to the Council, and thence to the Executive Committee matters that could be more properly discussed and settled by the larger body

The Secretary announces that he has been able to revive an old custom and each member can now find printed in the back of his Annual Directory a copy of the Constitution and By-Laws together with the Principles of Professional Conduct

The Secretary recommends to the House that Pr John A Card be delegated to continue his addresses on insurance problems to the District Pranch Meetings and to various County Societies

his work during the past two years having been well worth while

In closing his report the Secretary extends his thanks to the various officers and members whose friendship and support have lightened the burdens of his official life He especially thanks the Presi dent for his many courtesies and expresses his admiration for the manner in which, despite the ravages of sickness he has conducted his office

He expresses his appreciation of the work of the Executive Officer and thanks him for valu able assistance

#### MEMBERSHIP STATISTICS

# REPORT OF THE COUNCIL

To the House of Delegates: Gentlemen:

The Council has the honor of presenting the following Annual Report; which includes those of its Executive Committee and Committee on Publication:

Two regular meetings have been held; June 4th, 1929, in Utica, and December 12, 1929, in New York City.

In accordance with the provisions of the By-Laws governing the Constitution of the Executive Committee the following members of the Council, nominated by the President, were elected to serve with the officers therein specified as the Executive Committee, John A. Card, Charles H. Goodrich, Paige E. Thornhill, Austin G. Morris and Thomas P. Farmer.

Other appointments were made as follows: Committee on Public Health and Medical Edu-

Ceorge W. Kosmak, John O. Polak, George F. Chandler, E. MacD. Stanton, William A. Groat, Chalmer J. Longstreet, Stanhope Bayne-Jones, Clayton W. Greene.

Committee on Public Relations-

cation—

William H. Ross, William D. Johnson, O. W. H. Mitchell, Augustus J. Hambrook.

Special Committee on Insurance—

John A. Card and Charles Gordon Heyd.

Committee on Arrangements—

Walter A. Calihan, Austin G. Morris, Floyd S. Winslow, Benjamin J. Slater, Benjamin R. White, Leo F. Simpson, Charles G. Lenhart, Sol J. Applebaum, John Aikman.

Committee on Legislation—

Walter A. Calihan, John J. Rainey.

The following recommendations of the House of Delegates were acted upon favorably:

That the Annual Conference of Secretaries of County Societies be continued, and

That the President appoint a Committee of Five to study the question of Birth Control and Sterilization, and a Committee of Seven on Physical Therapy, Drs. Polak and Kovacs being respectively appointed chairmen of these committees.

At the close of the meeting on June 4th, 1929, the President delivered an address which was referred to a Special Committee for study and report back to the Executive Committee; Drs. William H. Ross, John A. Card and Harry R. Trick were appointed as such a committee.

The meeting on December 12, 1929, was devoted mainly to the reception and consideration of the reports of the various standing and special committee.

On motion, it was resolved that the Council recommend to the House of Delegates that more care be exercised in instituting special committees whose duties may lie within the province of one of the committees already instituted.

Regarding the Annual Meeting it was resolved that it is the sense of the Council that scientific sessions start at 10:30 Tuesday morning, June 3rd, 1930; that one session be devoted to Physical Therapy and that the banquet and general meeting be combined and held on Tuesday evening.

# **EXECUTIVE COMMITTEE**

The Executive Committee has held nine meetings and will hold another on May 8th. The first of these meetings was held in Utica immediately upon the close of the Council meeting and was devoted to the organization of the Committee and acting upon such appointments that, under the provisions of the By-Laws, came within its province.

The organization was carried out by electing James N. Vander Veer, Chairman, and John A Card, Vice Chairman.

The following appointments were made:

Committee on Publication-

William H. Ross, Chairman; Charles Gordon Heyd, Daniel S. Dougherty.

Budget Committee—

John A. Card, Chairman; together with the Secretary and the Treasurer of the Society.

Editor-in-Chief: Orrin Sage Wightman.

Executive Editor: Frank Overton.

Legal Counsel: Mr. Lloyd Paul Stryker, and attorney, Mr. Lorenz J. Brosnan.

The Executive Committee being the business committee of the Society much of its work is routine in character: providing for the proper and efficient carrying on of the affairs of the Society; receiving and acting on reports of committees; appointing special committees to care for emergent work; preparing the budget and referring it with all subsequent applications for expenditures, together with the recommendations or comments of the Committee, to the Trustees.

To write, therefor, into an Annual Report, the entire transactions of the various meetings would be unnecessary waste of space and provide tiresome reading. For this reason, mention will be made only of those of general interest.

The contract with the Executive Officer having been drawn originally for one year and never formally renewed nor endorsed by the Trustees, a special committee was appointed with power to draw up a contract between the Society and the Executive Officer after conference with Dr. Lawrence and Mr. Stryker. Said contract to be

presented to the Trustees for approval This committee, consisting of Drs Card, Heyd and Dougherty, accordingly met with the Executive Officer and the Counsel and agreed upon a contract which was approved by the Trustees

The following appointments were made

Pollution of the State Water Ways C H Goodrich, C K Deyo, C D Post E H Marsh, H W Jones

Periodic Health Examinations C W Cramp ton G B Stanwix, L Coville, C C Tremb ley, W W Britt, J B Garen

High Cost of Medical Care H R Trick, W H Conley, E MacD Stanton, G A Leitner, W R Thompson J A Hartwell

Birth Control and Sterilization J O Polak, S B Blakely, P E Thornhill, C A Gordon, Jumes E King, R L Dickinson, Arthur H Paine

Committee on Nursing Education N B Van Etten A Sloan J R Kevin, G W Kosmak G R Critchlow, G E Bielby, Arthur S Chittenden, W H Conley

Toxin Anti Toxin N B Van Etten, M Nicoll, Jr., L R Williams, G F Rainey, C A Gordon, W W Britt, F E Sondern, H G Weiskotten, W H Ross S W Wynne

Representatives to meet with the Commission of Labor W W Britt and J E Jennings, alternate Γ H Flaherty

Committee on Research A B Wadsworth, B T Simpson, S Flexner, J E Sweet, A J Foord, S Bayne-Jones F T van Beuren, Jr

Committee on Economics S Erdman H Hicks, H J Knickerbocker, G R Critchlow Committee on Physical Therapy F G Reid, E L Forster, W J Craig, H J Knickerbocker E H Turrell, C L Coon

Committee on Prize Essays 1 H Curtin, G R Critchlow, S J Kopetzky

After careful consideration of the invitations r ceived from various cities it was decided to hold the Annual Meeting in Rochester on June 2 3 and 4, 1930

In addition to the foregoing appointments the Committee endorsed the appointment of Dr Gordon Gibson on the Committee on Scientific Program

Iwo vacancies hiving occurred on the State Grice necessary of the term of Dr O S Wightman and the resignation of Dr Grant C Madill, the Executive Committee in accordance with the provision of the Medical Practice Act presented to the Board of Regents three nominations for each vacancy Drs John Douglas Harry S Patterson and Orrin

S Wightman being named for the first, Arthur D Jaques, J Richard Kevin and Walter D Lud lum for the second

Proposed amendments to the By-Laws of the Herkimer County Society, Nassau County Society, New York County Society and Schenectady County Society which consists of the Committee on By Laws, which consists of the Speaker, the Secretary and the Legal Counsel

At the March meeting, the Committee received and accepted with deep regret the resignation as Counsel of Mr Lloyd P Stryker

Upon the recommendation of Mr Stryker Mr Lorenz J Brosnan, who has been associated with him in the work, was appointed Counsel Mr Maxwell G Klutt being appointed attorney

At the curnest request of the Committee, Mr Stryker consented to act as consulting Counsel for the Society but without fee

#### COMMITTEE ON INSURANCE

The Insurance Committee during the past year has attempted to accomplish three things (1) to lessen mal practice suits, (2) with the aid of legal counsel to clarify the differences arising out of group insurance, and (3) to codify all legal opinions on the application of group insurance as it concerns the members of the Society

In keeping with these objectives the Committee his held numerous meetings with the legal counsel and at various times a representative of the insurance company, or a member of the Insurance Committee has visited every district branch during the current year, has answered all queries, and attempted to have the members of the So ciety fully acquainted with the application of their policies, and the full protection that it affords

The current year, so far as the workings of the group insurance are concerned, has been highly successful and the figures bearing upon mulpractice suits and costs are highly encouraging

There are always good and bad cycles in mal pricti e insurance but with the assistance of every member in cliningting unjust and improper claims, the level of insurance costs should gradually fall and the Committee feels that in the future it may be possible to achieve a reduction in the cost

#### THE COMMITTEE ON PUBLICATION

The Executive Committee is charged by the By Laws of the State Society, Chipter 5, Sec 3 with the duty to "Superintend all publications of the Society and their distribution". The two regular publications of the State Society are the Journal and the Directory.

Journal Departments The Executive Committee has continued its policy of making the Journal

in fact as well as name the organ of the Medical Society of the State of New York, and of its constituent District Branches and County Societies. Three years ago the Journal was divided into the eleven departments into which its material is now divided. The following table shows the number of pages given to each department during the last three years:

Number of pages in each department of the New York State Journal of Medicine during the last three years:

	1927	1928	1929
Scientific	586	585	639
Editorial	84	77	73
Medical Progress	96	96	96
Legal	84	83	68
London Letter		8	12
News	229	238	207
Medical Wares	7	1	12
Daily Press	48	48	48
Book Reviews	50	50	48
Our Neighbors	99	139	127
Advertising	645	636	653
	1928	1968	1984

In a general way, the contents of the Journal fall into four groups:

- 1. Scientific articles.
- 2. Records of Society Activities.
- 3. Allied topics.
- 4. Advertisements.

Scientific Articles: The greatest source of scientific articles are papers read before the annual meeting, but an increasing number of excellent papers are submitted by prominent authors. Embarrassment is caused by the abundance rather than paucity of the articles.

A standard of choice of articles is that they shall appeal to the general practitioner of medicine, and it is gratifying that authors are always willing to make their papers conform to this standard, even to rewriting and condensing them.

The scientific pages of the Journal of 1929 constitute a cross section of the practice of modern medicine.

Records of Society Activities: The time was, not so very long ago, when the scientific department was about all that the members considered, but they are now turning to the News Department with increasing interest. It is this department which makes the Journal the "Organ" of the Society, for in it are recorded the activities of the Society and its officers and committees.

The Journal has laid special emphasis on the practice of medicine by medical societies in distinction from individual doctors and public health organizations. This is the age in which organ-

izations of all kinds engage in civic work along every conceivable line. Our Journal is the leading medical publication in the United States in the amount of space, the number of articles, and the completeness of the indexing of the reports of the civic activities of medical societies. The department of "Our Neighbors" consists of abstracts from other State Journals, and is the most complete record in existence of what the medical societies of other States are doing along civic lines. Yet the record could be considerably expanded if the activities were reported more extensively.

Allied Topics: Special effort is put forth to make our Journal a balanced publication. The legal department is devoted largely to a description of actual suits brought against doctors. The London Letter, the excerpts from the Daily Press, the Medical Wares, and the Book Reviews are of interest and value to every physician.

Advertising: Advertisers are seeking access to our Journal in greater numbers than ever before, because they say that it is being read by physicians to a constantly increasing extent. A Journal must first demonstrate its popularity over several years before advertisers seek it. It is a fact that advertisers no longer have to be importuned to patronize our Journal. They seek admission to its pages.

#### REPORT OF THE TRUSTEES

To the House of Delegates—Gentlemen:

During the past year, the Trustees have adhered to the policy of approving of appropriations of sufficient sums to enable the officers and Committees to carry on their functions with due regard to economy. The budget presented for the year was studied carefully, and each item scrutinized from the point of view of accomplishment and economy. We have not hesitated to disapprove requests for funds in excess of sums agreed upon in the budget, when, in our opinion, the enthusiasm of the Committee making the request, was leading to expense, without profit to the Organization.

Conversely, we have approved of additional sums, when the work of a Committee could not be successfully carried on by the amount fixed in the budget. The close scrutiny of expenditure has not been done in the spirit of the bureaucrat, but in accordance with what we believe to be modern business methods.

The Trustees feel that the permanent success of the Medical Society, as any other organization, depends primarily on the financial status. The accumulation of the surplus, gives the Organization foundation for future accomplishment and success. We are able to report the investment in first class interest-bearing securities of \$100,000. This fund should continue to increase, until it reaches a sum that will enable the Society to feel a sense of security and comfort in its finances; and give opportunity for greater accomplishment in the field of organized medicine.

The report of the Treasurer gives in detail the financial record for the year. The meetings of the Trustees have been held whenever there was business to be transacted, and have been regularly attended by the members.

Respectfully submitted,

Grant C. Madill, Chairman. April 1, 1930.

#### REPORT OF THE COUNSEL

To the House of Delegates— Gentlemen:

Your counsel herewith submits his report for the activities of the legal department of the Medical Society of the State of New York for the period from March 1st, 1929, to and including February 28th, 1930. This is the fifth and last annual report of your present counsel.

The writer's opportunity to become acquainted with the medical profession, to study their problems and, in so far as he was able, to assist in their solution, is one that he has thoroughly enjoyed and will always look back upon with great pleasure. We are living in a changing world, and these changes affect the medical profession as well as every other calling. It is necessary not only for the individual physician to keep abreast of the times, but for the profession itself to be attuned to what is going on in the world, and to the point of view of the laity towards all professional men, especially what the layman asks and expects from the practitioners of the healing art.

The writer has always felt that there is room for a better understanding between the lay and the professional world, and that the general public will be quicker to understand the personal, professional and economic problems of the professional man if these at times were more fully explained. To the best of his ability, your present counsel has endeavored to do this through the medium of the editorial columns of the State Journal, in his appearances

before legislative committees, in his papers before the various component county societies and district branches, and especially in his actual defense of those of your members who have found themselves defendants in malpractice actions. A jury represents a cross-section of the general public. The writer has always found that it is possible before twelve laymen to take the most complicated scientific question of diagnosis, treatment, prescription or operation and to resolve this into its simple elemental terms in such a way as to make it clear to the intelligence of the average juror. What can be done with juries can be done with the public as a whole.

Your present counsel leaves you with feelings of strong regard and admiration for your profession and for its individual members. He has been fortunate in securing the personal friendship of a large number of physicians throughout this State, who have been quick to assist him in the performance of his work. He hopes and feels that he has the friendship of the entire profession, and he regards this as a sacred possession which he will never voluntarily relinquish.

Your present counsel has served under five different Presidents and five different groups of officers and committees, and he feels that your Society has been particularly fortunate and wise in the choice of those who, from time to time, have been called upon to take the leadership and the management of your af-

fairs. It has been a pleasure and a privilege to work and to cooperate with all of these gentlemen. It is a matter of regret that your present counsel will not serve under the incoming President, Dr. William H. Ross, whom he esteems as a physician of outstanding talent and character, and a man who will ably carry on the long and honorable traditions of his high office. This applies equally to your Secretary, Dr. Daniel S. Dougherty, and to those whom you will select as your new officers and committeemen. Your present Secretary (and we have no doubt, your Secretary for many years to come) is a tower of strength to the profession, and he has given to his office unusual funds of experience as well as his marked gifts of leadership.

Your counsel leaves you with the knowledge that your affairs are in perfect order, and with confidence that your Society will go on from year to year with increasing usefulness to your profession and to the lay world.

As you have already been informed, the writer's resignation as general counsel was submitted to the Executive Committee on March 13th to take effect on March 31st, and his associate Mr. Lorenz J. Brosnan, who since Mr. Oliver's retirement has been the attorney for your Society, has been chosen as general counsel to succeed the present incumbent. The reasons for the writer's resignation were set forth in a letter to the Executive Committee, and will be reproduced in his editorial appearing on April 1st, 1930. In his letter to the Executive Committee, the writer said:

"The reasons which prompt my resignation are based upon my desire to enlarge my professional life and to avail myself of the increasing opportunities which have come to me to act as trial counsel in other kinds of litigation. My duties as your general counsel have so preempted my time as to make it impossible for me to devote myself as fully as I should like to do to other fields."

Despite the dictates of his interests, we believe it unnecessary for the writer to assure you that he would not have resigned had he not known that there was available and able to carry on the work which he has done, a man who from every point of view is fully qualified for this honorable and difficult post. are now pending approximately five hundred cases in this office, either fully prepared or in the course of preparation, with all of which Mr. Brosnan is personally familiar. "He is," the writer in his letter of resignation stated, "therefore, able to step at once into the place which I am about to leave and is equipped in every way to fill it admirably. Not only do I express the unqualified opinion that your interests will be secure in his hands, but I will go even further and state that were I asked to

name any lawyer as competent and as trust-worthy for this position whom it would be possible for you to secure, I should say without reservation that there is no one whom I would prefer to this gentleman. He will be able to continue at the above address (as I am moving to 40 Wall Street) and will retain practically the entire staff, whose long familiarity with the details of this work is in itself quite indispensable to the successful handling of your legal affairs.

"May I say also that from my long personal, close and friendly contact with Mr. Brosnan, I have come most warmly to appreciate his fine personal traits, his sensitive honor and his possession of those qualities which make for con-

fidence and friendship."

It may not be without interest to reproduce here a portion of a paragraph contained in the writer's report of last year. He there stated:

"Mr. Brosnan entered the office of Whiteside & Stryker in the fall of 1920, has been continuously engaged in that office and in the writer's ever since. He has developed unusual gifts as a trial lawyer and has proven his mettle against some of the ablest lawyers who locked horns with this office. His record of successful trials is a matter upon which your counsel desires here to congratulate him. He has been entrusted with some of the most difficult cases in the office and has guided them through the courts to a successful conclusion. With perfect confidence I can and do assign to him any case in the office with the knowledge that the doctor's cause will be championed with marked skill and ability. He has a thorough knowledge of the law and unusual tact and discernment in court, as well as strong gifts of advocacy which he has developed under the continuous experience which has come to him.'

When Mr. Brosnan became attorney for the Society in 1928 upon Mr. Oliver's resignation, Mr. Maxwell C. Klatt, who has been with this office for nearly ten years and who is a lawyer of proven ability, took up and carried on the work which had largely fallen into the hands of Mr. Oliver. He has done this work well, and the Executive Committee therefore, in the writer's judgment most wisely, upon its elevation of Mr. Brosnan to the position of general counsel appointed Mr. Klatt as the attorney for the Society.

We take the liberty of here reproducing a portion of another paragraph contained in our

last annual report:

"Mr. Maxwell C. Klatt, whose work your counsel has had occasion previously to commend, is a member of the bar whose early promise has been increasingly fulfilled. Mr. Klatt has likewise been in this office or in the predecessor office of Whiteside & Stryker for upwards of eight years. Mr. Klatt's knowl-

edge of your problems and his experience with them has been developing rapidly. He too is now engaged in court work and has justified the high confidence which your counsel feels in him."

The categories heretofore employed in making the annual report will be here used again. These consisted in dividing the work of this office into three divisions (a) the actual handling of malpractice actions before the courts and juries and in the appellate tribunals, (b) counsel work with officers, committees and individual members of the Society, and (c) legis lative advice and activities

#### Litigation

The hazards and the dangers of litigation are ever with us So much has come from this pen on this subject, that we feel that it would be reiteration to say again what in our editorials and annual reports we have so often stated Many unfounded and unmeritorious actions are instituted, but as we have so often said, there are some cases which may be deem ed meritorious, that is to say, where the doctor sued unfortunately has not in some particular instance complied with the proper and ap-

proved practice with which the law compels him to be familiar and demands that he should follow. Cases of this kind have been settled Cases in which the writer has felt that the doctor had a valid defense have been fought out to the bitter end

From the following Table I, you will be pleased to note that in the past year only 28 cases have been settled, as compared with 66 in the preceding year. On the other hand, 192 actions were instituted in the period here reported on, as compared with 168 in the previ ous period Of the 144 cases disposed of, 28 were settled. In 114 either judgments for the defendant have been secured, or they have been disposed of through dismissal, discontinu ance or abatement Throughout the recording period 2 cases only resulted in judgments for the plaintiff On February 28th of this year there were actually pending in court 451 cases, as opposed to 403 of the preceding year, but these figures do not include approximately 150 to 200 claims in which actions have not yet been begun but many of which ultimately will result in actions in court The figures in the accompanying Table I tell their own story, and we feel require no further comment

Also the demonstrated success of the Group Plan, with which you now are so thoroughly familiar and of which such large numbers have availed themselves, requires no further state ment except to say that its value has increasingly been demonstrated. In those instances where doctors have found themselves sued for malpractice but have not had the benefits of insurance, we have invariably found that they have immediately caused themselves to be insured against any future contingencies of that It has not infrequently been brought to our attention that a given physician will insure himself for a time and then permit his insurance to lapse, only to find that thereafter suit has been begun against him upon facts arising after the lapse of his insurance, and has thereby found himself in the unfortunate position of being unprotected from a financial point of view In such instances likewise the physician has immediately availed himself again of the bene fits of our Group Plan to protect lumself against future contingencies

In this connection, it has been likewise ob served that sometimes a physician, who has permitted his membership in your Society to lapse and who has carried no insurance, will find himself sued with respect to matters arising during the time when he was not a member of the Society, and has thereby found himself in the position of hiving neither defense nor indemnity. We suggest that these unfortunate situations could be prevented if every active practitioner was careful to see that his membership in your Society, as well as in the Group Plan, continued at all times intact.

We append hereto Table II which gives a comparison of the number of members insured in 1927, 1928, 1929 and 1930 and the number of members in the county societies, and the percentage of insured members in the county societies and in the entire State Society. These figures are sufficiently clear to obviate the necessity of extended comment. It will be noted that there are now 12,314 members of the State Society, as compared with 11,806 members in the previous reporting period, and that there are now 7,170 insured members, as compared with 6,764 in the previous period. There has been an increase of 1 per cent in the insured

TABLE III

The following schedule of rates approved by the Society and effective May 1st, 1928 is published for the information of all members of the Society

EVAMPLE—Select the limits you require from COLUMNS A and LINES B Follow them to the point of intersection where you will find the rate for the combination of those lines. For example To find the rate for \$15,000 \text{45,000} limits, select the \$15,000 column as shown across the top and the \$45,000 line as shown down the side Follow these to their intersection where the rate of \$53.44 will be found

members in the present as compared with the previous reporting period.

# Counsel Work

During the period of this report, your counsel has prepared for publication in the Society's Journal articles in the nature of editorial comment. These editorials have included the following:

Individual Liability of Physicians for Acts Committed in Hospitals.

Collecting from Clinic Patients Able to Pay. Criminal Law, Compelling Attendance of Witnesses

Outside the State. Criminal Law in Relation to Contraceptive and Priv-

ileged Communications. The Country Doctor.

George Bernard Shaw Consults a Doctor.

The Law Progresses.

Legal Liability for Medical Service.

Motor Vehicles, Financial Responsibility Law. Motor Vehicles, Liability of Owner. Doctor and the Public.

The Doctor's Dilemma.

Malpractice Limitations Statute Held Not Applicable to Nurses.

Motor Vehicles, Connecticut Statute Upheld. This Year's Chiropractic Bills.

As in previous years, your counsel has digested and there have been published in the Journal reports upon malpractice actions which it has been felt were of special interest to the

profession. The case reports published during the previous year are as follows:

Cellulitis, claimed negligence resulting in amputation. Claimed improper diagnosis and negligence in treatment of child.

Claimed operation without consent.

Claimed failure to discover fracture.

Claimed failure to remove foreign particles.

Claimed negligence in supra-vaginal hysterectomy.

Claimed negligence in delivery.

Claimed negligence in the treatment of a fracture.

Claimed negligence in breaking of needle

Claimed negligence in intravenous injection.

Claimed negligence in operation for middle turbinate. Claimed negligence in treatment of a fracture of the femur.

Diathermy, contributory negligence causing burn.

Removal of foreign body from ear.

Gonorrheal pyosalpinx.

Gun shot wound, claimed negligence resulting in death.

Hernia, infection, removal of testicle.

Husband's claim for loss of services of wife.

Inflammation of the ear, claimed burn due to treatment.

Needle in body after operation.

Obstetrics, claimed negligence causing fracture of clavicle of baby.

Obstetrics, acute nephritis resulting in death.

Obstetrics, claimed breast abscess,

Obstetrics, claimed wrong diagnosis. Obstetrics, claimed delayed delivery.

Otitis media, claimed negligence in mastoid operation. Pott's fracture, claimed negligence in reduction.

Syphilitic depression of the nasal bridge claimed negligence in operation and treatment.

Tonsillectomy, death of child claimed to be due to

defendant's neglect.

Tonsillectomy, claimed broken tooth during operation. Claimed negligence in performance of tonsillectomy. Traumatic cataract, claimed negligence in treatment. Keloid, claimed negligence in injection prior to ton-

sillectomy.

Claimed negligence in treatment of breast.

Claimed negligence in treating compound comminuted

Claimed negligence in treatment of rectal abscess. Claimed contraction of pneumonia after delivery.

These editorials and case reports have been prepared as a result of much labor, and it is a source of gratification to your counsel that on so many occasions he has received approbation for his efforts in this direction.

In addition to his other duties, your counsel receives frequent requests for opinions upon various subjects. These come not only from the county societies, officers and committees of such societies, but from the individual members as well. Some of these inquiries related to matters of sufficient general interest to find reflection in editorial comment; others have resulted in private advice. Some of the matters upon which advice has been thus rendered are as follows:

Inquiry regarding the legal effect of standing orders to nurses in hospitals.

Inquiry regarding the authority of a physician to sterilize a patient, and the possibility of a change in the present laws controlling sterilization.

Inquiry regarding the use of inflammable gas anesthetic as regarding the responsibility of the hospital, the

surgeon and the anesthetist.

Inquiry regarding the liability of an eleemosynary laboratory for the acts of physicians, technicians and employees.

Inquiry regarding the use of the title "doctor" by an

individual not a duly licensed physician.

Inquiry regarding the statute of limitations applicable

to malpractice actions. Communication regarding the definition of the word

"hospital," and its applicability.

Inquiry regarding:

(a) The liability of physicians working in a charitable institution.

(b) The status of a person applying to a charitable institution for medical treatment

(c) The application of the law on dispensaries to teaching clinics.

(d) Who may prosecute for a violation of the dis-

pensary law. Inquiry regarding who may testify as an expert in a

malpractice action. Inquiry regarding the ownership of X-ray plates.

Inquiry regarding the legal effect of the use of order books or order sheets in hospitals.

Communication regarding controversies with the Fed-

eral Prohibition Commission.

Communication regarding medical advertising in daily periodicals.

Inquiry regarding actions for malpractice in connection with actions to recover for professional services.

Inquiry regarding the effect of acceptance of dues with application for Society membership.

Inquiry regarding authority to give advice in connec-

tion with birth control.

Inquiry regarding duties of insurance companies in majoractice actions.

Inquiry regarding authority of injured employee to select his own physician under the Workmen's Compensation Law.

Inquiry regarding malpractice defense where the physician is insured with companies other than the Aetna Life Insurance Company, particularly with reference to insurance companies not authorized to do business in New York State.

Inquiry regarding the use of hypodernuc syringes by

individuals not physicians.

Examination of provisions of County Society by-laws in connection with possible conflict with by-laws of the Medical Society of the State of New York Inquiry regarding the legal relationship arising be-

tween physician and patient.

Inquiry regarding collection of fees for professional services from patient's estate. Communication regarding collection of physician's

Inquiry regarding treatment of patient under the

Workmen's Compensation Law. Legislative Advice and Activities

Throughout this reporting period, as heretofore, various bills have been introduced in the Legislature having more or less bearing upon the medical profession. Our opinion has been

asked with respect to many of these and has been promptly given.

The usual chiropractic bill was introduced. and we commented on that very freely in our editorial of February 15th, 1930.

#### Conclusion

The writer of this report sends to the House of Delegates and to the officers, committeemen and individual members of your Society his greetings and the assurances of his good-will.

On the occasion of his resignation, the writer, at the request of the Executive Committee, accepted the position without compensation of consulting counsel. He was glad to do this, although no formal position is necessary, in order to assure you of his friendship and good-will.

You have a noble calling. Your profession is all too little appreciated by the general public. It numbers some of the finest men in the country. It has been a privilege and an honor to represent you as your general counsel, and the duties of that office are now laid down with sincere regret and with the recollection of strong friendships and many kindnesses.

Respectfully submitted.

March 31, 1930. LLOYD PAUL STRYKER, Counsel.

#### REPORT OF COMMITTEE ON SCIENTIFIC WORK

To the House of Delegates: Gentlemen:

Your Committee on Scientific Work has prepared an excellent program which has been printed. We wish to call particular attention to the hour of opening the scientific sections Tuesday, June 3rd at 10:30 A.M. This innovation, we trust will meet with the approval of those who

The general meetings will be devoted to a Symposium on Birth Injuries, Tuesday afternoon, June 3rd and one on Metabolic Disturbances, Wednesday afternoon, June 4th. The individual sections have arranged most instructive programs and we trust that the meetings will be unusually well attended.

The Committee has been fortunate in securing several out of the State speakers. For the first time in many years a President of the American Medical Association will address the Society. for Dr. M. L. Harris of Chicago, will speak on "Medicine Under Siege."

Your Committee has labored under many handicaps, chief of which was the unfortunate selection of the date of meeting, which conflicted with the time set for several of the special societies. This, of course, made it unusually difficult to secure essayists.

When your Chairman rendered his report to

the Council at the December meeting, several members of that body expressed disappointment when it was stated that no clinics would be held. The Chairman of the Committee on Scientific Work then invited the University of Rochester School of Medicine and Dentistry to prepare clinics for Thursday, June 5th. A clinic day of wide scope and great attractiveness was prepared by that university. The Executive Committee at its meeting on April 10th ruled that no clinics be held under the auspices of the State Society. When this fact was communicated to the University of Rochester, the Dean of the Medical School fortunately for us, decided to hold the clinic day as a University feature. Therefore, the medical men of the State will have the opportunity to visit the newest medical school in the State of New York, meet the men in charge and sce the type of work that they are doing.

The Chairman has been assisted in every way by the members of his Committee and he here expresses his appreciation to each one for his loyal support and cooperation. He urges that everyone who can possibly go to Rochester do so at the time of the general meetings so as to receive the inspiration and uplift which always comes from contact with progressive medical men.

Respectfully submitted,

ARTHUR J. Brdell, Chairman. April 1, 1930.

# REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates: Gentlemen:

Your Public Relations Committee-is deeply conscious of its ever broadening field of activity as well as the complexity of many of the questions that are presented to it for adjustment. The new economic and social era affecting medical practice, which includes the broad principles of Preventive Medicine and Public Health, demands a readjustment of the relationship of the profession to health organizations generally, whether they are governmental or purely voluntary.

The object of this committee is to aid in all ways in the readjustment of the medical profession to the new conditions confronting it and to assist in harmonizing the various groups working in the field of Public Health and Preventive Medicine; thus hoping to eventually produce an interlocking, coordinate body whose purpose shall be a united effort directed towards the prevention of disease as well as increased efficiency in the care of established disease. To this end your Committee has given its best effort and has come together monthly, usually in Albany, to discuss and plan methods of bringing together the medical profession and other health agencies on a cooperative basis, assuming that the medical profession in and of itself cannot handle this ever increasing health problem except by a proper utilization of the many agencies now working in this field. Sel dom has any member been absent from such meetings. Many of the officers of your society have likewise been in attendance, and given us of their time and wise counsel. Especially do we wish to comment upon the pleasant and cooperative relationship existing between this Committee and the Committee on Public Health and Medical Education. Naturally, our fields interlock and each Committee should understand the work of the other in order to avoid duplication along certain lines. We wish to take this opportunity of expressing our thanks and appreciation to Dr. Farmer, Chairman of the Committee on Public Health and Medical Education for his attendance, interest and counsel at the meetings of this Committee.

The personnel of the Public Relations Committee remains the same as of the previous year, viz.:

William H. Ross, Secretary, President-Elect of the State Medical Society; W. D. Johnson, Chairman of the Surgical Section of the State Medical Society; A. J. Hambrook, Past-President of the Rensselaer County Medical Society; O. W. H. Mitchell, Professor of Public Health and Bacteriology. Syracuse University, Former Commissioner of Health of Syracuse;

James E. Sadlier, Chairman, Ex-President of the State Medical Society.

Through the courtesy of your Executive Committee, Dr. Joseph S. Lawrence, Executive Officer, was detailed to act as Field Secretary for this Committee at such times as his other duties would permit. This arrangement has proven most beneficial, relieving your Chairman and Secretary of many onerous tasks and much detail work. The careful thought and wisdom exercised by Dr. Lawrence in the work performed is gratefully acknowledged by the Committee.

Our Secretary, Dr. William H. Ross, has, as usual, been an indefatigable worker on this Committee, going here and there over the State and addressing medical and lay groups in the interest of our various activities. Especially commendable is the interest he has shown in the development of County Departments of Health. All members of the Committee have given freely of their time to meet with County Medical Societies and impress upon them the importance of establishing a proper relationship with other health organizations and developing their respective societies along the line of taking an active and leading role in all the health activities in their county.

Your Chairman and one or more of the members of the Committee met in conference with the Chairman of the County Society Public Relations Committees at the time of the District Branch meetings. These conferences were of value in outlining to the county chairmen what we desired accomplished in their respective counties and in instructing them with reference to method and plan of making a basic survey of the existing measures which are practiced in curative, preventive medicine and public health in each of their counties.

We are pleased to report that nearly all of the sixty county medical societies have established a Public Relations Committee, thereby giving your State Committee a definite point of contact for future work with the counties.

One of the chief present activities of the Public Relations Committee of each county is to take the fundamental step of making a survey of existing health organizations, and their functional activity in preventive medicine, the hospital and welfare facilities in the country, and following this, a study of the present relationship of medicine to all these organizations.

Arranging for these conferences with the County Chairmen and carrying them to a successful issue was an important feature of our work during September and October.

Methods of cooperation with lay health or-

ganizations, fraternal, welfare, education if and commercial groups in their health programs have been advanced, and measures adopted to effect cooperation with the various lay health organizations throughout the state

Dr William H Ross, President Vander Veer and Dr J E Sadlier, were appointed a sub committee to confer with the Departments of Health and Education upon all matters of importance to the medical profession having to do with curative medicine, public health or the prevention of disease

Acting upon the suggestion given by the House of Delegates that many hospitals prevented physicians and surgeons from collecting for services rendered industrial cases admitted to the wards, the Committee on Public Relations, on October 5, 1929, addressed to 247 hospitals, which were thought to be all of those in the state that might take industrial cases the following questionnaire

1 Do you admit compensation cases to your wards?

2 Do the rules and regulations of your hospital prevent the surgeon from receiving compensation for services rendered industrial cases admitted to wards?

Two hundred and thirty-nine replies were Of these three came from hospitals that take no industrial cases whatsoever, nine were from private hospitals, and 227 were from general hospitals Of the 227, 193 replied that they admitted industrial cases to their wards Thirty four hospitals said they either had no wards or made special provision for industrial work Seven said they provided special wards for industrial cases. In 19 the industrial cases are treated in semi private wards, and in 4 as private patients in private rooms. Several that admit cases to the general wards commented that in their opinion industrial cases should not be treated the same as public cases, but special provision should be made for their One hospital stated that industrial cases were admitted to all of its services—the wards. semi private wards and as private patients, de pending upon the request of the physician id mitting the case

Aside from the municipal hospitals of New York City, only 7 stried that physicians or surgeons were not permitted to make charges for their services on industrial cases. In onc of these the physicians, by common consent donate the fees to the hospital for a special fund. Two hospitals stated that physicians are not permitted to make charges for the care of patients on the public ward, except for industrial cases.

Since the Committee made this investigation the corporation counsel of New York City has been considering the revision of the municipal charter which prevents attending physicians from making charges for services rendered industrial patients. It is hoped that such revision can be made.

From this study we derive the information that physicians and surgeons of this state are allowed to receive compensation for industrial cases cared for in the wards of the hospitals of the state except in the Municipal hospitals of New York City and seven others, many of the latter being in or about New York City Your Committee would suggest such action by this House of Delegates as might lead the Depart ment of Hospitals of New York City to revise the Municipal charter and allow the medical and surgical staff of these hospitals the privilege of charging for services rendered industrial cases

Your Committee is able to report that there has been established with the Departments of Health and Education of the State Govern ment, a very desirable, cooperative relationship which will result to the advantage of future health conditions and to the benefit of the med ical profession. At present the Department of Health seeks the advice and counsel of this Committee on controversial matters relating to the medical profession and the advancement of Public Health and Preventive Medicine most important subject of discussion with the Department of Health has been the pending question of State and County owned General Hospitals to be developed in rural sections of this State

We became acquainted with the fact that State and to general hospitals now existing, or to be developed in rural sections of the state, was fast becoming an important subject for consideration, and that the State Department of Health was considering this subject, as indicated by the following statement from the official bulletin of that department

'A request for grant of State aid for a county general hospital will receive consideration when such a request comes from a rural county with a population of not over 50 000 and in which county it has been determined that hospital care and treatment are unavailable or in accessible provided that the status of the county is such as to make the establishment of such a hospital an economic hardship without State and In the establishment of such a hospital the provisions of the General Municipal Law (Section 126-135b) must be followed "Health News of December 2, 1929

This viewpoint was accentified when I exis County, by referendum vote, instructed its supervisors to appropriate a sum of money, to be met by an equal sum from the State for the construction of a general hospital for that county. Your Committee at once began a study

# REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates: Gentlemen:

Your Public Relations Committee, is deeply conscious of its ever broadening field of activity as well as the complexity of many of the questions that are presented to it for adjustment. The new economic and social era affecting medical practice, which includes the broad principles of Preventive Medicine and Public Health, demands a readjustment of the relationship of the profession to health organizations generally, whether they are governmental or purely voluntary.

William H. Ross, Secretary, President-Elect of the State Medical Society; W. D. Johnson, Chairman of the Surgical Section of the State Medical Society; A. J. Hambrook, Past-President of the Rensselaer County Medical Society; O. W. H. Mitchell, Professor of Public Health and Bacteriology, Syracuse University, Former Commissioner of Health of Syracuse;

James E. Sadlier, Chairman, Ex-President of the State Medical Society.

Through the courtesy of your Executive Committee, Dr. Joseph S. Lawrence, Executive Officer, was detailed to act as Field Secretary for this Committee at such times as his other duties would permit. This arrangement has proven most beneficial, relieving your Chairman and Secretary of many onerous tasks and much detail work. The careful thought and wisdom exercised by Dr. Lawrence in the work performed is gratefully acknowledged by the Committee.

Our Secretary, Dr. William H. Ross, has, as usual, been an indefatigable worker on this Committee, going here and there over the State and addressing medical and lay groups in the interest of our various activities. Especially commendable is the interest he has shown in the development of County Departments of Health. All members of the Committee have given freely of their time to meet with County Medical Societies and impress upon them the importance of establishing a proper relationship with other health organizations and developing their respective societies along the line of taking an active and leading role in all the health activities in their county.

Your Chairman and one or more of the members of the Committee met in conference with the Chairman of the County Society Public Relations Committees at the time of the District Branch meetings. These conferences were of value in outlining to the county chairmen what we desired accomplished in their respective counties and in instructing them with reference to method and plan of making a basic survey of the existing measures which are practiced in curative, preventive medicine and public health in each of their counties.

We are pleased to report that nearly all of the sixty county medical societies have established a Public Relations Committee, thereby giving your State Committee a definite point of contact for future work with the counties.

One of the chief present activities of the Public Relations Committee of each county is to take the fundamental step of making a survey of existing health organizations, and their functional activity in preventive medicine, the hospital and welfare facilities in the country, and following this, a study of the present relationship of medicine to all these organizations.

Arranging for these conferences with the County Chairmen and carrying them to a successful issue was an important feature of our work during September and October.

Methods of cooperation with lay health or-

relationship and establish a new adjustment to correspond to present day social trends, because these social trends are leading to different public demands. If we do not do these things, there is danger of a declining influence in the years to come. There was once a time when every man was in control of his own relationship to others but in these days groups of people work together and individual relationships no longer can be depended upon as a professional guide.

The medical profession should adopt as a principle a cooperative relationship with every health or welfare effort in the state and it should not wait for an invitation. The profession should go to the State government or any of its departments with an offer to help in any public health project. It should go with a plan for betterment and in the spirit of conference and with the objective of the advancement of

public health, public welfare and the common

The profession ought to follow the same plan with the unofficial health agencies, child welfare organizations and parent teacher associations. In no ther way will we ever secure the leadership that we ought to have and avoid the danger of a declining influence.

There is a common ground for agreement and the Public Relations Committee is endeavoring to set up a program, based on the cardinal principle of cooperation, that will benefit the public and will benefit the profession also and that will grow, as the years come and go, until the profession of medicine is again the mighty force through the family physician that it once was in human affairs.

Respectfully submitted,

JAMES E. SADLIER, Chairman.

# REPORT OF THE COMMITTEE ON LEGISLATION

To the House of Delegates. Gentlemen:

The Committee on Legislation began its work by following the custom of preceding years in addressing a communication to the legislators, both new and old, offering the assistance of the committee, through the Executive Officer, in studying matters which would come before them during the 1930 session. We also laid plans immediately for the promotion of the candidacy of Dr. Madill for membership in the Board of Regents. Through individual communication with each member of the legislature, we urged Dr. Madill's election and are gratified to report our success in his appointment.

The legislative session was longer this year than usual, surpassing the 1929 session by two weeks and, accordingly, many more bills were introduced and necessarily studied by your committee. On the 4,124 bills introduced, at least 209 of them had some bearing upon the practice of medicine and were of sufficient importance to require reading and conferences with the reference committee holding them.

Beside the frequent conferences the Legislative Committee had in Albany with the Executive Officer, the chairman kept himself in close touch by correspondence and, in the last two weeks, by frequent conversations over the telephone.

With few exceptions, the usual bills were introduced. The birth control and anti-vaccination bills were conspicuous by their absence. The antiviviscction bill received its usual reception in the Codes Committee, where it was effectively opposed by representatives of the Committee on Medical Research. The osteopaths introduced their amendment of two years ago, asking that they be permitted to use certain drugs and perform surgery. Opposition to their wishes was very evident, in spite of the influence of an exceedingly strong lobby in their favor.

Three chiropractic measures were introduced in the Assembly, one of which was introduced in the Senate as well. The bill which was before both houses was much more drastically drawn than any of its predecessors and there was apparent among the legislators a very serious feeling that the bill should be passed. The requirements were intentionally made so rigorous that only those chiropractors who really had some educational training could have expected to pass examination in the subjects outlined. Your committee was asked by leaders in the legislature to present a careful criticism of the bill, which was done, and later the bill was amended so as to conform with the criticisms, with the exception of the waiver clauses, but, as stated above, these were so rigorous that they could hardly be made more so without taking them out entirely. The bill was definitely defeated in the Assembly and laid on the table. A day or so later it was taken from the table and voted upon again and defeated, but in the meantime it had gained a great many supporters.

The optometrists were interested in two bills which were defeated. One would have authorized boards of school trustees to employ optometrists in the examination of school children's eyes and the other would have permitted optometrists to use the tille "Doctor."

The health insurance bill was more comprehen-

sive than in preceding years, but received no greater consideration.

Several important bills had our staunch support and we were quite hopeful of having them passed. One of these was the bill we favored in two preceding years, which would have created an advisory medical council in the Department of Labor. This bill successfully passed the Assembly and was to be reported out for final passage in the Senate when opposition was placed to it by Commissioner Perkins. We were greatly surprised at this action on the part of the Commissioner, because the Executive Officer had previously discussed the bill with her and she had endorsed it, agreeing to speak with the Chairman of the Finance Committee, with whom the bill The explanation she offered was then resting. of her final action was that she really had not studied the bill until she saw there was a possibility of its becoming a law, although the bill was identical with the ones introduced in preceding years. She thought it gave a medical council entirely too much power and feared that it might become burdensome to her. She stated, however, that she was in sympathy with the idea of having a council of physicians to advise with her and offered to confer with us after the close of the legislature, for the purpose of rewriting the bill.

Another bill in which we were greatly interested was the one that was drawn at the suggestion of the Committees on Public Relations, Public Health and Medical Education, and Legislation, providing for the licensure of all up-state hospitals, the power to be placed with the Department of Social Welfare, which now has authority to inspect and visit dispensaries. This bill was amended a number of times before it passed the Assembly, but even then we asked that it be · amended before it passed the Senate. Probably its failure was due to the delay occasioned by this last amendment. The bill as it passed the Assembly called for the licensure of all hospitals, but it was thought that it would be wiser at first to direct the licensing to unincorporated hospitals and to limit the State Department's duties to licensure alone. It is hoped that this idea will receive careful consideration during the summer by all interested parties and a satisfactory bill introduced in the next legislature.

A bill granting the injured workman free choice of physician was introduced in both houses and the joint Committees on Labor and Industry gave it a hearing. The Legislative Committee was represented by the Executive Officer. Representatives of United Industries, insurance companies and the Industrial Surgeons' Association appeared against the bill. It was really drawn in favor of the injured workman and it was very surprising—and somewhat embarrassing—to find that representatives of Federated Labor took no interest in

it whatever. Many of them attended the hearing, but made no plea for the bill's enactment.

A number of compensable occupational diseases were increased by four, bringing the total to twenty-seven compensable industrial conditions. Two amendments were made to the law that relate to the care of the aged. One provides for pensioning. This carries no medical specifications, but its administration will, without doubt, carry into the practice of medicine. The other calls for the erection of sectional infirmaries for the care of incurables among the aged. The object of this latter amendment is to relieve small counties of the necessity of providing infirmary accommodations for the few incurable chronics that they might have, and permitting three or more counties combining and erecting one infirmary for their common use.

The Saratoga Springs development which was authorized will also have great interest for the medical fraternity, although the law is very vague, as to details.

Many other bills were introduced that would have proven more or less helpful and some more or less vicious. An outstanding one of this latter group was introduced by the Department of Labor, following the report made by a committee appointed by the Commissioner of Labor and Industry to investigate places in New York City where injured workmen are being treated. The amendment reads as follows: "The places where such medical, surgical or other attendance or treatment is provided shall be maintained and operated in a sanitary manner, in accordance with regulations of the industrial board." It will be noticed that this amendment would authorize the inspection and regulation of the physicians' private offices, providing they treated injured workmen, and Commissioner Perkins said that it was the intention of the amendment to have private offices inspected. It will also be noticed that this inspection was to be done by the industrial board. These places, other than doctors' offices, are in reality dispensaries, and if any investigation is to be made, it should be made by the Department of Social Welfare, where inspection of other dispensaries is reposed. This bill, as well as the other objectionable ones, was killed by our oppositions.

Our relations with the legislature were most cordial, and particularly with the Committees on Public Health, Education, and Labor and Industry. The cooperation we received from the chairmen of the County Legislative Committees was of such outstanding character that we want to take this opportunity of extending them our sincere thanks. Several of the Societies sent us at regular intervals a complete statement on the bills with informative comments as to the decisions they reached regarding them. We also wish to express our appreciation of the cooperation re-

ceived from the Sanitary Officers' Association, whose Legislative Committee held one of its meetings in our office.

A statement of the final action on bills will be sent out as a last bulletin.

#### Suggestions to the House of Delegates

That the Legislative Committee always stands ready to consult and cooperate with any other committee of the State Society with reference to the introduction of legislation affecting the medical profession and that in the future, all committees of either the State or County Societies consult our committee before initiating or introducing any state legislation.

That some state committee be assigned the task of coordinating the activities of the various committees so as to make their work more productive—and to avoid friction.

That the Colleges, Universities and scientific societies be asked to help us in our fight against these new cults and quack organizations. For years the medical profession has had to lead the fight against them. The promise of easy money without any hard work or study has made it possible for their leaders to raise large sums of money for the purpose of backing legislation which

would make these, "parasites of the sick," legitimate practitioners. They have tried to influence legislation by offering retainers as attorneys to some of the most influential men in the state. So far the Medical Society has fortunately defeated their legislation, but they may not always be so lucky. We must appeal to the Colleges, Universities, scientific societies and powerful welfare organizations to help us resist this constant pressure. Our reason for demanding their help may be stated in the following words:

"If there is a grain of truth in the so-called theory of chiropractic, it is the duty of these organizations to teach it. If on the other hand the whole thing is a fraud, then it is the duty of these organizations to the public to come out and say so and to help the medical profession resist their infamous attempts to rob the sick and the hope-

lessly ill.

In addition to our state legislative activities, we were in frequent correspondence with committees of Congress regarding bills in its consideration. These were particularly bills regulating the use of narcotics and alcohol.

Respectfully submitted,

HARRY ARANOW, Chairman

April 14, 1930

#### REPORT OF THE COMMITTEE ON PHYSICAL THERAPY

To the House of Delegates: Gentlemen:

Your Committee on Physical Therapy has earnestly endeavored, during its first year of existence, to approach the solution of the problems relating to the practice of physical therapy.

As a result of the extended use of physical measures during the war, they became better appreciated by the medical profession, manufacturers were eager to sell apparatus, a large number of trained technicians were anxious to continue work and the public was desirous to receive this new type of treatment. The majority of physicians and medical institutions were, however, not quite ready to respond to the existing demand, whereas non-medical persons were ready to do so, and as a result the latter obtained not only direct support from the public and from some physicians, but also received, in some instances, legal recognition as a separate healing craft. It has become evident, however, that physical measures will benefit patients most when administered under the immediate and continuous control of a physician who knows why, when and how to apply them, and who also knows what other medicinal, dietetic, orthopedic measures are to be used in conjunction with them. Your Committee realizes that the chief problem is, therefore, to furnish to the medical profession reliable information about the status, the scope and the limitation of physical therapy and to point out the desirability of its proper study and practice. Such information was published in the New York State Journal of Medicine and sent also to County Societies, hospitals and interested physicians.

The Committee joined with the Committee on Economics in cautioning physicians from buying apparatus on a salesman's advice only and beyond actual needs, and also repeated the advice of the Committee on Public Health and Medical Education, that physicians should not partake in lecture courses offered under commercial auspices. The following information was obtained about the physical therapy curricula offered in undergraduate and graduate schools in New York State.

# PHYSICAL THERAPY TEACHING IN MEDICAL COLLEGES OF THE STATE OF NEW YORK

- 1. The New York University and Bellevue Hospital Medical College gives no course in physical therapy to physicians, but their School of Education at Washington Square gives such a course for technicians, in conjunction with the Hospital for the Ruptured and Crippled. This course leads to the examination for the physio-therapy license.
- 2. Columbia University gives an elective course during the third and fourth years of undergraduate work, one hour per week during each quarter. It also offers extension courses for graduates of medicine, at intervals, at Mount Sinai Hospital and Montesiore Hospital.
- 3. Cornell University gives no postgraduate course but devotes one morning a week for four weeks to groups of the undergraduates at the Hospital for the Ruptured and Crippled.
- 4. The New York Homeopathic Medical College and Flower Hospital gives a course of eleven hours of practical clinical work and eleven hours didactic to the third year students and also to the senior class. These is no postgraduate course.
- 5. The Polyclinic Medical School and Hospital of New York offers a four weeks' course, daily, on the theory and practice of physical therapy in all departments of medicine, with four weeks' optional additional clinical work; this course is given regularly every two months.
- 6. The New York Postgraduate Medical School and Hospital has no organized course in physical therapy. A few hours are devoted to this subject in the Orthopedic Seminar.
- 7. The Albany Medical College gives no separate course, but includes instruction in conjunction with the course in Therapeutics and also in conjunction with the course in Orthopedics.
- 8. Syracuse University, during the second semester of the fourth year, gives one hour per week of didactic work in physical therapy, and two-hour clinics weekly through a four-week period.
- 9. The University of Rochester School of Medicine and Strong Memorial Hospital gives no definite course in physical therapy.
- 10. The University of Buffalo gives a course to third-year students, in which sixteen hours of instruction are equally divided between recitations and demonstrations.

Your Committee endeavored to maintain interest in physical therapy in all County Societies by recommending the appointment of a Special Committee on physical therapy in each of them. The following Counties have responded: Albany, Bronx, Delaware, Erie, Genesee, Kings, Lewis, Montgomery, Nassau, New York, Orange, Queens, Rockland, St. Lawrence, Suffolk, Tompkins, and Westchester. In addition inquiries were received from several other Counties. In order to stimulate and coordinate the work of the County Committees, they were regionally invited to attend the stated monthly meetings

of your Committee which were held alternately in New York and Albany; one meeting was held in Syracuse in order to make better contacts with the Counties further up-State. There was a gratifying attendance at all meetings and a useful exchange of information. Your Chairman was invited to address the County Societies of Albany, Otsego, and Dutchess-Putman, an also responded to the request of the Chairman of the Committee on Scientific Work to arrange a program for a morning's session, to be devoted entirely to physical therapy, at the time of the annual meeting in Rochester.

A peculiar situation was created by the physio-therapy clause in the Medical Practice Act licensing non-medical people to practice physio-therapy under the supervision of a duly licensed physician; for this act made no provision either for the carrying out of this supervision, or for the revocation of the license for due cause; in addition, the number of licenses is far in excess of the number originally estimated. Your Committee endeavored with the cooperation of the Secretary of the State Board of Education, with the Legal Division of the New York Department of Health and with the organization of registered physio-therapists to work towards the control of the situation as far as possible. Progress has been made, but the problem is not yet satisfactorily solved.

The question of physical therapy in industrial work was taken up by conference with the insurance carriers and the Committee on Medical Economics. Although there was agreement to the fact that the present practice of physical therapy in compensation work is unsatisfactory, it was found that its improvement requires the solving of other similarly unsatisfactory phases of the problem, and efforts to this effect are still being carried on.

The Chairman of your Committee was invited to attend meetings of the Committee on Public Health and Medical Education, and Medical Economics, and expresses his grateful appreciation for the cooperation extended him, and also wishes to thank the staff at the State Society Office, and Dr. Joseph S. Lawrence, Executive Officer, and his staff for their very kind assistance in the execution of the details of the work of the Committee.

Respectfully submitted,

RICHARD KOVACS, Chairman.

April 1, 1930.

#### REPORT OF THE BOARD OF CENSORS

To the House of Delegates.

Gentlemen:

The Board of Censors has held but one meeting

during the year.

Pursuant to the call of the President, the Board convened on April 9, 1930, in the offices of the Medical Society of the State of New York, to hear the appeal of Dr. Samuel I. Muller, a member of the Medical Society of the County of Kings, from the action of the Medical Society of the County of Queens in disregarding charges against Dr. William J. Lavelle, a member of said Medical Society of the County of Queens.

The courtesy of being represented either by Counsel or in person having been accorded both parties, Dr. Lavelle and Dr E. E. Smith appeared for the respondent; the appellant exercising th right of resting his case on the data submitted.

After hearing the testimony of Drs. Laveli and Smith and giving due consideration to the written statements submitted, the Board rule that the matters embraced in the appeal be re mitted to the Medical Society of the County o Queens with a further ruling that the Board of Censors of said Society accord to the appellan a hearing; provided, however, that said appellan shall file proper written charges with the Presi dent of the Society.

Respectfully submitted.

D. S. Doughfrty, Secretary.

April 1, 1930

# REPORT OF THE COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates-Gentlemen:

Your Committee on Medical Research desires to report that during the current session of the Legislature the Vaughan Assembly Bill Int. No. 157 was introduced to amend the penal law to prevent experiments upon living dogs. Medical and other educators as well as public spirited citizens were induced to protest its passage to their representatives in the Legis-

The Committee on Codes of the Assembly to which the bill was referred held a public hearing on February 18, and our position in the matter was ably presented by Dr. Peyton Rous of the Rockefeller Institute, Dr. J. E. Sweet of

Cornell Medical College, Dr. C. C. Lieb of the College of Physicians and Surgeons, New York, and Dr. Augustus B. Wadsworth, Director of Laboratories of New York State Department of Health. The bill has not been reported out of Committee.

Your Committee has rendered like service in the matter of the bill now before Congress, namely H.R. 1884 "To prohibit experiments on living dogs in the District of Columbia or the territorial or insular possessions of the United States."

Respectfully submitted, Frederic E. Sondern, Chairman. April 1, 1930.

# REPORT OF THE COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

To the House of Delegates-Gentlemen:

Your Committee on Public Health and Medical Education begs leave to submit the following report for the current year:

During the past year this Committee has been engaged with the consideration of many varied activities in the field of Public Health in addition to the usual amount of routine business associated with its well established functions. However, when reviewing the activities of the past year together with the reports of this Committee for the past four years, it is apparent that the Committee has continued to progress along well established lines having concentrated its efforts and resources where the need was manifest, and actual results were

to be accomplished without duplication by some other agency. The work of this Committee is based on the premise that a most essential requisite for successful Public Health achievement is the whole-hearted cooperation and participation of the physician, who because of his education, training, and experience is particularly fitted for an important part in such a program. On this premise the Committee has developed its policy to be the investigation of Public Health activities and the education of the physician in these matters. While the activities of other committees, both standing and special, are more or less concerned with questions of Public Health, it should be remembered that these are largely of interest from their political, social, economic, and con-troversial standpoints. While the necessity

of such interests is admitted, nevertheless, the principal duty of a large medical body such as this State Society in public health work should be concerned with the scientific and educational side of the problem and it is hoped that the society will continue and maintain its prestige along these lines.

#### GRADUATE EDUCATION

The Committee, feeling that adequate and efficient medical service is a most necessary activity in a public health program, and that organized medicine is largely responsible for such efficient service, has continued as its major activity, graduate work in medical education, through the means of extension courses given before county medical societies, in order to aid the individual physician in his efforts to keep up with the advance of medical science and to emphasize what can be done by him in preventive medicine. The following is a report of the courses sponsored by the State Society under the direction of this Committee during the current year. The figures after each course indicate the number of lectures in that course.

#### **FALL OF 1929**

Wayne	Surgery6
	Surgery
	Internal Medicine6
Sullivan	Internal Medicine6

	Heart Disease5
Genesee (with Orleans and	
Wyoming)	Heart Disease5
	Traumatic Surgery5
	.Tuberculosis4

### SPRING OF 1930

Chemung	.Internal Medicine6
	. Neurology6
	Traumatic Surgery6
Onondaga	.Internal Medicine6
	.Internal Medicine6
Jefferson	.Internal Medicine6
Delaware	.Surgery6

As stated in the last annual report of this Committee detailed records of these courses have been kept in the office of the Chairman. A summary of the courses which were held during the current year before January first is herewith given:

Total number of courses	9
Total number of lectures	49
Number of county medical societies before	
which courses were given	12
Total attendance of all courses	1623
The largest attendance for one course (Mon-	
roe County)	841
The smallest attendance for one course	•
(Rockland County)	57
Total cost of all courses\$1,	745.38
	193.93
Average cost per county	145.45
Average cost per attendance	1.08

In view of the fact that some courses are not completed until after the meeting of the House of Delegates it is impossible to give a summary for the entire year's work at this time. However, the work for the year 1928-29 can now be reported. A summary for this period follows:

Total number of courses	21
Number of county medical societies before	
which courses were given	31
Total attendance of all courses	4809
Largest attendance for one course (Monroe)	836
Smallest attendance for one course (Herk-	
imer)	66
Total cost of all courses\$4,	777.07
Average cost per course	217.96
Average cost per attendance	.98

The courses which the Committee, at the present time is prepared to arrange for county medical societies, are as follows:

Dermatology and Syphilology
Internal Medicine
Neurology3
Obstetrics and Gynecology2
Pediatrics2
Orthopedics3
Periodic Health Examinations
Physical Therapy2
Surgery8

It will be noted that the Committee is now offering in some subjects more courses than last year, while in others the number has been decreased. This is due to the fact that either new courses have been added or that some of the former courses have been combined into one course

As the subject of Graduate Education has been discussed in such detail in the last two annual reports, it would now seem unnecessary to consider any of the problems concerned with the work, but rather to present the results accomplished, and the efforts to further improve this service according to the plan now in opera-The demand for future courses leaves no question as to the popularity of this work with county societies. Six counties applied April first for courses given during the fall of 1930. Of these six counties five have definitely selected the subjects for the courses. The attendance at the courses demonstrates the interest of the work and justifies its expense. Graduate Education as carried on under the present plan increases the interest of many physicians in the work of the county medical society and is an incentive for non-members to apply for admission in county societies. The chairman's office frequently has reports indicating the value of the lectures to the public at large in the more wide spread adoption of new methods of diagnosis and treatment, the value of which has been stressed at lectures. For instance, the president of one county medical society reported, that after a course of lectures in that county

in which there was included a lecture on syphilis, that there had been a tremendous increase in the number of diagnostic specimens sent to the county laboratory, and furthermore that the specimens were being submitted at a much earlier period in the disease. That the result of such instruction was both better treatment and better control of the disease, is a most logical conclusion.

The past three years' experience seems to have amply demonstrated the feasibility of the State Medical Society's ability to carry on graduate education as now in force Increasing improvement in the organization of the work, especially the routine details in the Chairman's office, together with better cooperation on the part of county medical societies, has not only increased the efficiency of the lectures but has also reduced expense. At the time of writing of this report it would seem more than probable that the cost of this year's work will be very considerably below the actual allotment of funds made this year to this Committee, as well as being much less than the expense for last year The Committee, therefore, feels that the question of charging a registration fee for the graduate courses should be indefinitely postponed, certainly, at least, until some better reason for such action exists than is now an parent One of the main factors in reducing the expense of the work has been the grouping of two neighboring counties for the same course on the same day by which plan also the lecturer is able to give his service more conveniently Improvement in organization of records and forms in the Chairman's Office has also tended to reduce expense especially that due to telephone, telegraph and railroad travel The officers of the county societies can mate rially contribute to further reduction of expense by prompt attention to their corre spondence

For the first time during the past year the Committee has given with most gratifying results in two counties the course in Traumatic Surgery outlined by Dr John J Moorhead of New York City. The Committee has also added three new courses to its general list. These include the course in Gastroenterology outlined by Dr W A Bastedo of New York City, a course in General Medicine outlined by Dean Alan R Anderson of the Post-Graduate Hospital, New York City, and a course in Neurology outlined by Dr Toster Kennedy of Cornell University Medical School. The latter course is to be given in Clinton County beginning April first

The State Department of Health has continued its cordial cooperation with the Committee in graduite education in Tuberculosis. The course on this subject in Rockland County

was given under the direction and with the financial aid of both the Division of Tubercu losis of the State Department of Health and this Committee In addition to the work now carried on, the Committee is anxious to see an extension of graduate teaching along two defi First, the introduction of a whole day given over to four or six post graduate clinical lectures as a substitute for the group of four to six weekly lectures, and second, the in troduction of more intensive clinical teaching to small groups simultaneously with the week ly lectures Under the latter plan those physicians taking the clinical work would neces sarrly be expected to pay a fee to reimburse the teacher for the extra time given but it would seem that such expenditure on his part would be amply justified as it would save the student a much greater expense due to travel loss of income, etc. During the past three years there have been 57 courses given before 40 societies Of this number 8 counties had three courses and 14 have had two courses. These courses have included 324 lectures given by 112 lec Again the attention of the House of Delegates is called to the debt of gratitude which the State Society owes these gentlemen for the efficient service which has been so courteously given During the past year the Committee has been requested by the Commis sion on Medical Education for information re garding post graduate work sponsored by this State Society In view of the fact that it has re ceived similar requests in former years from the States of Michigan, New Jersey and Virginia it is quite evident that graduate education is rapidly becoming a well recognized function of State Medical Societies and with profit to all concerned might furnish the topic for a conference of a national or inter-state group

#### COMMITTEE MEETING

On January eighteenth the Committee held a meeting in New York City at which time in addition to reviewing its work in graduate education it heard of the work being done by the special committees on Physical Therapy, Periodic Health Examinations and Polluted Water Supplies from the chairmen of these committees, and also considered the questions of county health units, county hospitals receiving state funds, diphtheria immunization maternal mortality, further control of tuberculo sis and cancer Dr Plunkett of the Division of Tuberculosis of the State Department of Health discussed with the Committee the further control of Tuberculosis While many factors are involved in this problem the greatest help which the physician can give is by cor rect and early diagnosis. In this effort the graduate courses offered under the combined auspices of the State Department of Health

and the State Medical Society offer one of the most valuable aids: consequently every county medical society should seriously consider having a graduate course of lectures on Tuberculosis. Dr. Godfrey, Director, Division of Communicable Diseases of the State Department of Health, sent a summary of what had been accomplished diphtheria immunization in throughout the State. Dr. Thomson, of the Kings County Medical Society, told of the work accomplished in diphtheria immunization in the Borough of Brooklyn. After a thorough discussion of the question of diphtheria immunization the Committee adopted the following recommendation to be sent to the House of Delegates: That there is need for further work on the part of the medical profession in the extension of diphtheria immunization and that the results in the City of New York, especially in the Borough of Brooklyn. have indicated that the success of this work depends largely upon the physician's part in the immunization of children and that the committee inform the House of Delegates that it is willing to attempt throughout the counties of the State the introduction of methods such as used in Brooklyn provided it is so instructed by the House of Delegates. Following the discussion of maternal mortality the Committee adopted the following recommendation: That while deaths from toxemia and sepsis due to pregnancy have been reduced throughout the state largely as a result of a campaign of education, part of which had been carried on under the direction of this Committee, nevertheless, the benefit of this reduction has been wiped out by an increased mortality due to increased operability. That this Committee recommend that operative obstetrics be employed under proper supervision as well as in institutions under appropriate supervision. statement led to the recommendation afterwards made in the joint meeting with the Committee on Public Relations: That the Legislative Committee be asked to initiate legislation for the proper licensing of all private hospitals in the state. This subject was later considered in a conference between representatives of various State Departments and officers of the State Medical Society with the result that a bill to provide proper licensure of all hospitals in the state was introduced in the Legislature. Cancer as a public health problem was generally discussed. Further consideration of this problem was left for a future meeting, no action being taken except the approval of the educational work of the American Society for the Control of Cancer.

### OTHER PUBLIC HEALTH ACTIVITIES

During the year the Committee has been of service to county societies in obtaining speak-

ers for their regular meetings. The Committee is prepared to offer a much larger service in this direction than it has been called upon for in the past. At the request of the Westchester County Medical Society, Dr. Polak and Dr. Kosmak, two members of the Committee, furnished aid in advising as to a survey to be made by that society of maternal mortality in Westchester County. In July a letter was sent to the Secretary of each County Medical Society asking for information as to activities of each county society in the field of Public Health, and also their plans for graduate education. Replies were received from the secretaries of forty-five county societies, exactly seventy-five per cent of the entire State Society. A very creditable showing was made in view of the fact that many of the replies were returned immediately. Nevertheless, it is regrettable that one out of each four of the county societies should fail to furnish a committee of this Society brief information, which would materially expedite their work for the year. The replies received indicated that county societies were interested in a wide variety of public health activities including such subjects as county health departments, adequate hospital service, communicable diseases, diphtheria immunization, tuberculosis, social hygiene, maternity hygiene, child welfare, prenatal care, heart disease, crippled children, cancer, and dairy and milk inspection. four secretaries reported that their county society was not actively engaged in any specific public health work. It is believed that this statement does not represent a true statement of conditions, but is probably due to the fact that the secretary had not been informed of the activities of the work of some of the commit-The Committee early in the year sent letters to the Public Health Committees of the county societies requesting their cooperation. with the state committees on Periodic Health Examinations and Physical-Therapy. Committee has now under consideration a plan for the publication in the State Journal of short articles dwelling on the Importance of Preventive Medicine in the Regular Work of the Physician. These articles, which it is hoped will be prepared by leading authorities in the various branches of medicine, will be concise, emphasize what can be done in prevention by the physician while engaged in curative medicine, and demonstrate that the physician is already doing a large amount of work in preventive medicine for which he has not received credit. This plan, which probably will be discussed at a meeting of the Committee before the annual meeting, will require much consideration and if adopted will require adequate

preparation, so that no detailed report can be made at this time.

The Chairman has attended all the meetings of the Executive Committee this year, meetings of several of the District Branches, many meetings of some of the other committees as well as the conference of secretaries of the county societies. This latter conference amply shows its benefit to the State Society. It especially affords the chairman of this Committee an excellent opportunity to evaluate the work of graduate courses in the various county so-The chairman has also had various conferences with representatives of the State Department of Health as well as representatives of voluntary health organizations who have been surprised to learn of some of the definite activities which the Society is engaged in as a contribution to Public Health. That they are gratified with these activities is indicated by a letter received by the Chairman of this Committee from the Managing Director of one of the largest national health organizations, in which he calls our efforts quite marvellous and states that he will attempt to stimulate such desirable activities in other parts

of the country.

The Chairman again wishes to express his appreciation of the work of the other members of the Committee as well as the cordial assistance of the President, Secretary, Treasurer, and other officers of the State Society. Acknowledgment is also again made of the excellent cooperation extended by the other committees of the State Society both standing and special and particularly of the most cordial relations that have continued to exist between the chairmen of these committees and the Chairman of this Committee. The competent secretarial service which has been furnished the Chairman has relieved him of a large amount of the details of the office work of the Committee and has greatly enhanced the results

Respectfully submitted,

THOMAS P FARMER, M.D., Chairman April 1, 1930.

#### REPORT OF THE COMMITTEE ON MEDICAL ECONOMICS

To the House of Delegates ---Gentlemen:

The Committee on Medical Economics consists of five members, Dr. Benjamin I. Slater. Rochester, Chairman, Dr. Seward Erdman, New York; Dr. Horace M. Hicks, Amsterdam; Dr. Homer J. Knickerbocker, Geneva; Dr. George R. Critchlow, Buffalo.

We held three general meetings during the year; one on November 26th, 1929; January 16th, 1930, and March 19th, 1930, at the office of the Legislative Bureau in Albany. Owing to illness, Dr. Hicks has unfortunately been

unable to attend any of the meetings.

Dr. Critchlow undertook a study of the fees paid by insurance examiners to physicians making examinations for life insurance companies. There is a disproportion between the amount paid for accident insurance as compared with health insurance. The work is approximately the same. It was the aim of Dr. Critchlow and your Committee to increase the fee in both instances. Letters were written to twenty insurance companies. Reports received were to the effect that insurance companies were not altogether pleased with the examination that they were receiving; that the physicians who were conducting the examinations were entirely satisfied. By and large the insurance company saw no reason, in view of the promptness with which they paid their bills, of increasing their fees.

The Committee was of the opinion, however that the examination for for maidant

health work should be the same where the amounts of money involved are approximately the same. Slight difference in clerical work in one instance as compared with the other does not warrant a fee of three dollars in one case and a fee of five dollars in the other.

Dr. Seward Erdman, as a special committee. investigated the Knickerbocker Adjustment Service Company in New York City. It was a great surprise to members of our Committee to receive his report. Many physicians from various parts of the State have been constantly complaining of the service rendered by this Agency. .Dr. Erdman received very courteous treatment. He investigated every complaint that was made. He is firmly convinced as is the Committee that the fault lies as much with the physician as it does with the Agency. Physicians have been very slow to cooperate: have not abided by the rules of their contract and in almost every instance where a corrplaint was made, were entirely unfamiliar and the contents of the contract which they significant

In signing such a contract it is refer at in mind that the physician is given and attorney to the Adjusting Committee should read carefully every reason in contract. Failure to under 2 2 2 the contract has resulted in the

than any other single eare

Practically all of the constant terms of the Mivsician.

Societies.

At the last meeting of the Committee held in Albany on March 19, 1930, it was recommended that such County Societies as are interested would call the Manager of the Knickerbocker Adjustment Service Company in consultation. The Manager of this Company has advised the Committee that he will cooperate with any sufficiently large group of physicians assisting them in forming a collection agency of their own. The title would be any one which they would choose to adopt; the officers of the Agency would be members of the profession of their own choosing; the policy of the Company would be determined by these same officers; the treasurer would be one of their own members; the management of the Company, however, and work would be directed by the representative of the Adjustment Company.

The fees charged would be reasonable; the business appears to be profitable; the Committee has every reason to believe that a great many present day collection problems would be solved by this method. It certainly is worthy of a trial by some County Society. The Committee feels that its adoption by a County Society would justify all of the work which the Committee has put into this study and, perhaps, result in great good to the individual physicians who are members of such

The Chairman of the Committee addressed the Medical Society of the County of Queens on January 28, 1930. The subject was "The Workingmen's Compensation Law from the General Practitioner's Standpoint." There was a very large audience who appeared to be appreciative of the educational efforts which were made to bring to the physicians a thorough knowledge of the medical aspects of the Compensation Law.

The Committee also met with Dr. Kovacs of New York City and framed a statement which was to be made to the Industrial Commissioner and the members of the Medical Society of the State of New York if approved by the Executive Committee of this same Society.

The Committee has passed on many bills effecting the practice of medicine in New York State. Their opinions were forwarded to the Executive Officer.

Unfortunately Dr. Knickerbocker, one of the members of the Committee, confined his efforts solely to the presentation of three legislative bills and was unable to attend more than one of the three meetings. The Committee was frank to admit that its functions were not legislative and, undoubtedly, this work might better have been turned over to the Legislative Committee of the Medical Society of the State of New York for respectful consideration.

A great deal of correspondence was entered into between the Chairman and various members of the Society interested in the economic phases of medicine. Ways and means were pointed out whereby the Economic Committee might be of service to various County Societies.

The Committee was of the opinion that physicians as a group are doing too much charity work for which they receive no pay. They see the time not far distant when physicians as a group will demand pay for their services. In various clinics throughout the State everyone connected with the clinic or its administration is paid. The Committee is unable to see why the physicians should be called upon for an increasing amount of free service to institutions both private and public.

We recommend a study of this subject to a future Chairman of this Committee.

On every side the Committee is conscious of the growing encroachments of clinics, public and private institutions on the practice of medicine to the economic detriment of the general practitioner of medicine. If there is any solution of this problem, the Committee feels it must lie in the employment of more physicians at full-time to combat these evils. After all the full-time executive secretary of these various agencies is the individual who is most responsible for their activities. He must be met by a representative of the Medical Society who has a similar status. For various reasons it is almost impossible to get the services of any responsible group of physicians in a community to undertake a study of the economic phases of medicine in their own community. A full-time medical officer of the State Society, however, would be in a very advantageous position to make such a study. Working out of the office of the Executive Officer or the Secretary of the State Society, however, such an officer might properly visit a community and make a complete study of the economic phases of medicine, taking such time as is required for this subject. He might, for example, inquire into the economic conditions of free patients; examination of school children by the family doctor as well as by the physician employed by the city; take census of abuse reported by the practitioners themselves and, in every way, prove himself of benefit to members of the Society. The Committee is convinced that in no other way can this problem be met satisfactorily. It is the experience of every person who has undertaken a study of this problem that the manager of all institutions reported the policy of their respective administrations to be almost perfection. The facts, however, are frequently otherwise. A field worker is the logical man to bring out these facts.

The Chairman takes occasion to thank the members of this Committee who have worked earnestly to further its interests. He is convinced, however, that it is very difficult to get many physicians to give much time to the work of this Committee. His solution was in having more full time men in the services of the Society. Such men, under the direction of the Committee or the Society, might accomplish much good.

The Chairman is especially desirous to commend the work of Dr Seward Erdman of New York City who has been unusually faithful in investigating the Knickerbocker Adjustment Service Company in New York City

Respectfully submitted,

BENJAMIN J SLATER, Chairman

April 1, 1930

#### REPORT OF THE COMMITTEE ON PERIODIC HEALTH EXAMINATIONS

To the House of Delegates

Gentlemen

The Committee held its organization meeting on September 20th, 1929, at Saratoga Springs, with officers of the State Society present as counsellors and guests. The Chairman, having conferred with the members by mail, offered a formal statement of the preliminary policy and program, which, after discussion, was adopted

At this meeting the members of this Committee accepted assignments to definite phases of the work. Arrangements were made to give addresses at the meetings of the several District Branches. Arrangements were made for cooperative action with the Committees on Public Health and Medical Education, Publication and the Committee on Public Relations.

The work before the Committee was considered of great and continuous importance to the public and the medical profession. It was recognized that the benefits of the Periodic Health Examination were unquestionably great, that every resident in the State of New York should be examined, that the Medical Society had a duty to the public, to its members, to the medical profession and to medical To the public, it was responsible for the presentation of sound medical facts upon which they could rely and which would urge them toward the getting of periodic health examinations To the members, its duty was to clarify their ideas regarding the health examinition, and make available all helpful information concerning the same. The duty of the Society to the medical profession lies in the obtaining and presenting of scientific facts, preserving the dignity and usefulness of the private practitioner, and extending and adapting his service to the needs of the public in looking forward and preparing to meet the needs of the future

The Committee has envisioned a ten-year program. Up to the date of this report it has done seven months of active work. Its primary duty was to establish policies, programs and landmarks which would be fundamental and

safe The results of its work will be found in many quarters of the State, in many departments of human affairs, but particularly in the increasing regard in which the health examination is held by the public and the increasing number of physicians of the State who are interested in the subject and who are taking up the service

The Committee begs briefly to summarize the year's work and experience in the following set of resolutions. These are given to close the Committees work, and to give to the Society and to the new Committee on Periodic Health Examinations an opportunity to go ahead from the point where the present Committee laid down its labors.

I Whereas the periodic health examination will in general, save life, decrease suffering, postpone deterioration and decay, and increase health, happiness and efficiency, and whereas the periodic health examination is a medical procedure,

Be It Resolved 11:11 the Medical Society of the State of New York hereby recognize its duty and privileges in the premises as follows

The Society should take a leading part in the education of the public on the subject of the periodic health examination, cooperating with responsible organizations of a public, semipublic or private character, working toward the same end

Discussion

This presents the public health education element. Public education has been carried on by the American Medical Association, the Gorgas Memorial Foundation, the American Public Health Association, the Tuberculosis and Health Association, the United States Public Health Service, the Department of Agriculture, the Department of Labor, various philanthropic organizations and foundations and campaigns have been carried on by local county medical societies state medical associations, etc., etc., during the past decade. There exists an enormous an ternal in various forms

motion picture reels,

ters, and all kinds of literature. Many campaigns have been conducted, and they usually make the same mistakes over and over again. The Society should, in the coming year, do the following:

Ascertain what organizations are interested in health examinations, what they are doing, what they wish to do, and how they will cooperate with the Medical Society and how the Medical Society may use them as channels. There is an enormous force which can be put into operation. There are hundreds of organizations ranging from federal bureaus to local sewing circles which can be brought into play. A man in a small town can be reached directly or indirectly through ten to thirty channels. Many organizations have their own news service, channels of communication and information, and are ready to put them at the disposal of a worthy cause. Many organizations have initiated their own health examination cam-Your Committee has come in direct contact with organizations which reach the total population of the State many times over. An analysis of the whole situation is indicated in the attached list of twenty-three classes of organizations. Each class contains from three to three hundred member organizations.

## GROUPS OF ORGANIZATIONS FOR THE NEW YORK STATE HEALTH EXAMINATION FIELD

- 1. Federal Departments (Department of Agriculture, Interior, Labor, War; U. S. Public Health Service, Bureau of Education) Governmental Commissions.
- 2. State Departments (Department of Agriculture, Education, Labor, etc.).
- 3. Health Departments (State, County and City).
- 4. Medical Societies (National, State and County).
- 5. Health Organizations (National Health Council, Women's Health Foundation, etc.).
- 6. Health and Welfare Organizations (National and State).
- 7. Insurance Companies.
- 8. Industries—Railroads, Banks, Manufacturers, Wholesalers, Retailers, by groups, and organizations.
- 9. Commercial Organizations (National, State and Local Chambers of Commerce and National, State and Local trade organizations).
- 10. Labor Organizations (American Federation of Labor, etc.).
- 11. Scientific Societies (American Association for Advancement of Science, etc.).
- 12. Colleges—Private Schools.
- 13. Educational Societies (National Education Association, etc.).

- 14. Other National Social Associations (National Civic Federation, etc.).
- 15. Men's Clubs (Rotary, Kiwanis, Lions, Exchange, etc.).
- 16. Women's Clubs (General Federation, National Council of Women, etc.).
- 17. Y.M.C.A., Y.W.C.A., Knights of Columbus, Y.M.H.A., etc.
- 18. Adolescent Groups (Boy Scouts, etc.).
- 19. Patriotic and Defense Societies.
- 20. National Congress of Parents and Teachers.
- 21. Exercise and Recreation Societies (American Athletic Union, N.A.A.F., etc.).
- Fraternal Organizations (National and State).
- 23. Religious Organizations (National, State, Council of Churches, Catholic Church, Jewish, etc.).

The recommendation of this Committee is therefore that the Society should multiply its own strength many hundreds of times by a survey of these forces, continued liaison contact and consultation, and with our medical direction, their stimulation along right lines. This will not only be constructive but it will save these organizations from doing things which may be seriously damaging to the medical profession. This requires the employment and payment of competent services under the direction of the Committee, with clerical help This is the modern method of in addition. procedure. It is recommended. As an example of the manner in which a number of organizations have been tied up to a health program, eighty-three organizations are now cooperating with the American Child Health Association.

b. The Committee recommends that there shall be prepared by the Society a plan of procedure for health examination campaigns to be conducted by the local committee or city medical societies. This pamphlet should include every step in the procedure from the arrangements for the initial call for the formation of a Committee, through all preliminary stages of the campaign, its final meeting and its follow-up. This will be most effective. It will save expense, trouble, disappointment and waste of opportunity and honest labor. In this connection, attention is called to the excellent pamphlet of the Albany County Campaign which illustrates a few of the important essentials of a campaign document, notably the employment of cooperating agencies. The provision of a campaign guide for the local medical society will multiply greatly the Society's opportunities for public education throughout the State, at the same time multiplying the number of physicians who will take part in this educational work.

The Committee wishes to concentrate its recommendation upon the foregoing two matters. There are many other questions of public education and public policy which are in process of development and which are omitted for the present.

II. Whereas the periodic health examination is a comparatively new, and to some extent an unfamiliar procedure, in which good doctrine, right methods and sound tradition must be established for the aid and guidance of the physician in his dealings with the patient, with the public, and with industry and the like.

BE IT RESOLVED that the Society undertake to inform its members in so far as possible, as to the best methods of conducting health examinations for men, women and children under the various conditions of life, employment and other circumstances, so that they may receive the greatest possible benefit from the procedure.

#### Furthermore.

BE IT RESOLVED that the Society investigate the health examination procedures now carried on by various commercial organizations, industries, associations and the like, with reference to the character and efficiency of the examination, the benefit to the examinee, the compensation to the medical examiner, and the general effect of this growing practice upon the welfare of the public and the medical profession; and that the Society deduce from this investigation a set of principles of procedure with reference to the economic aspects of the health examination.

#### Discussion:

Your Committee has frequently heard the Statement: "The physicians are not interested in the health examination." And, "Any physician can conduct a health examination, other statements of a similar nature indicating a diversity of opinion. The health examination covers the whole gamut of medicine in its every phase and specialty; the whole realm of personal hygiene, and the whole field of human experience. The literature is scanty, and opinion im-perfect and misleading. There is urgently needed contributions of all specialists as well as the wise leadership of general practitioners in developing a point of view and a method of thought and procedure in putting forward this subject. An endeavor should be made in cooperating with the Committee on Public Health and Medical Education to supply the physicians of the State with theoretical and practical instruction on the subject. North Carolina has employed a physician to go from community to community to give demonstrations.

This work is partly educational, partly pedagogical, but it is largely a matter of research and constructive planning in an endeavor to bring medical science, hygiene and human conduct into effective harmony. This requires a professional service which should be provided for.

The Committee being concerned with the matter of economics, Dr. Britt, reports as follows:

"General survey of subject-conclusions as follows:

"1. There is an enormous amount of health examination unsuspected generally by members of the profession.

"2. This has a large and rapidly growing economic significance. The work falls into

these classes:

"a. Examination for employment.

"b. First aid and medical treatment.

"c. Follow-up periodic health examinations.

"3. The Committee makes the following urgent recommendations:

"a. This matter be investigated thoroughly, report made and funds be made available for survey.

"b. This Committee approves of industry conducting its entrance examinations.

"c. We believe that Industry should confine its treatment to emergencies and not engage in the practice of curative medicine.

"d. We urge Industries to refer its employees to their regular physicians for Periodic Health Examinations, in accordance with the plans submitted by this Committee to the Bell Telephone Company."

In connection with the economic situation, a Bill has been introduced into the Legislature calling for the examination of all State emplayees by the Department of Health under rules of procedure determined by the Department. While the Committee believes that all State employees should be examined, the matter raises many questions which have not been considered carefully from every standpoint. This should be done. In this age of increasing "efficiency" the practice of medicine, particularly the giving of health examinations is more and more being taken up by industrial, welfare and other organizations which employ physicians. As employees, these physicians examine or treat more and more individuals in less and less time, with less and less proportionate if not actual compensation. This is mechanized medicine. It seems to be less human and of less benefit to the patient. This is portentous. For the benefit of the physician and the public it must be considered.

Dr. Garen, in his recommendations to the Committee, makes the following suggestions:

He proposes that "the following procedures be used for the purposes of:

a. Interesting county societies in periodic health examinations.

b. Creating discussion in the County Society

of the entire plan.

c. Obtaining a preliminary allocation or designation of physicians willing to interest themselves in Periodic Health Examinations, and to hold themselves out as prepared and qualified to do such examinations.

Procedure No. 1. The purpose of the health examination shall be outlined to the county

societies.

Procedure No. 2. Endorsement of the value and worth of the health examination shall be obtained from the County Society.

Procedure No. 3. News items in all local

papers covering the above.

Procedure No. 4. Carefully prepared paid advertisements to appear in local papers, expounding value of health examination. Advertisements to appear under authorization of County Medical Society (and State Committee) and to be paid for and subscribed to by those local county society members who volunteer to do so."

Dr. Coville, who was assigned to Agriculture on the Committee on Periodic Health Examinations held a meeting attended by Dr. C. E. Ladd, Director Extension, N. Y. State College of Agriculture; Miss Martha Van Rensselaer, Dean, College of Home Economics; Dr. Dwight Sanderson, Rural School Organization; Dr. W. Wright, State Leader of Junior Extension; and developed plans for the cultivation of this field.

## MEMORANDUM TO PUBLIC AND PRIVATE AGENCIES OPERATING IN THE FIELD OF HEALTH

The Medical Society of the State of New York has begun a ten-year scientific and educational program in futherance of the health examination. The Committee recognizes that other organizations, (federal, state, national and local) are devoted in whole, in part, or incidentally, to health and the health examination. To avoid duplication and gain power, the Committee would avail itself of such experience, guidance and aid as may be offered. For example,—

Suggestions for the guidance of the Committee, the State Medical Society or medicine in general.

Information that the organization is now performing some important function in the premises that need not be duplicated.

3. An offer to take over some important function in education or research in aid of the purpose of the Medical Society of the State of New York, or to enter into conference for this purpose.

4. A request that the State Medical Society

return to the organization the results of its labors, or in some specific way give aid.

5. Finally and particularly, what help is available to the County Medical Society that wishes to conduct a campaign for health examinations? What aid will be given, in what way, and under what condtions?

Our first duty therefore is to find and assay the forces in health examination field and enlist them in our project, and aid their operation in our field.

The second part of the project seeks to inform individuals directly of the benefits of the health examination, or through associations, clubs, leagues, industries, labor unions, of which they are members, and urge their participation.

The third duty of the Committee relates to provision for good medical examination services

by the physicians in the State.

This request is being sent to a number of governmental and private organizations. The Committee shall be glad of your preliminary reply at an early date, and a more complete communication in time to be considered at a general conference of this subject, to be held in Rochester in June, 1930, in connection with the annual meeting of the Medical Society of the State of New York.

#### SUMMARY

The Chairman of the Committee wishes to draw the attention of the members to the monthly reports and articles written for the State Journal of Medicine which have been published or will be published, which record the substance of its labors and which may be referred to by those who desire more closely to inform themselves of the nature and the results of the Committee's work.

The Committee asks that the Council and the House of Delegates earnestly consider its two foregoing resolutions and the reasons therefor, and make adequate and reasonable provision for the next year's program of programs.

To the officers, committee members, assistants, and members of the Medical Society of the State of New York who have aided the work of the Committee with their kindness, counsel, direction and service a warm appreciation is extended.

#### PUBLIC MEETING

To close its year's work, the Committee on Periodic Health Examinations of the Medical Society of the State of New York will hold an open public meeting and dinner immediately after the last session of the State Convention at Rochester, Wednesday evening, June 4th.

All members of the State Medical Society and their wives and friends are invited to attend.

This meeting is the result of one of the lines of work followed out through the year by this

Committee The Committee has studied health examination campaigns conducted by health asso ciations and by county societies and others. It has noted that physicians are not the only persons interested in the Health Examination Great industrial organizations, national and State departments and bureaus, and powerful social welfare organizations, large membership organizations of men and women, as parents by professions, by fraternal interests, etc., are interested primarily or secondarily in health and the health examina-They exceed five hundred in number In membership they exceed the total population of the State many times, for it is the rare person who is directly touched by less than two score of these organizations These organizations exert a pervading, continuing influence which is very great and beyond present calculation

To awaken, stimulate and employ these tremendous forces of human organization for the purposes of public health is the most profitable way that organized medicine can use its energy. It is the executive effort that directs power that is most effective. The health examination campuign conducted by physicians only is unwise. That campaign that organizes local forces, many of which are duplicated in all parts of the state and country shows the beginning of wisdom Cooperation is the key, mutual acquaintance, respect and confidence are the prerequisites.

Therefore, this meeting is held to typify this principle, and insofar as possible, to give an example of an assembly of some of the great forces which may be used for the purposes of health, and specifically, to further this ideal,—"A health examination for every citizen of the State."

It is expected that there will be represented among the speakers, the United States Government the Government of the State of New York, women's organizations, industry, and a variety of organizations found in every city, town and countryside of the State, with the officers of the Medical Society of the State of New York

It is especially fitting that the Medical Society of the County of Monroe and the Rochester Chamber of Commerce are to be the hosts of the occasion, represented by Dr Walter A Calihan, Chairman of Committee on Arrangements and Dr William A Sawyer, Local Chairman on

Periodic Health Examination

Further announcement will be made as to the exact time and place of the dinner, the cost per cover, (which will be small) and the schedule of speakers Members of the Society who are officers of the County or City Medical Societies are especially invited to attend

Respectfully submitted,

C WARD CRAMPTON, Chairman April 1 1930

#### REPORT OF THE FIRST DISTRICT BRANCH

To the House of Delegates—Gentlemen

The annual meeting of the First District Branch was held at Briarcliff Lodge, October

25th 1929

Following the luncheon, which was served at 1 30 P M, addresses were given by Dr James N Vander Veer, President of the State Society, Dr Thomas B Futcher, Baltimore on the "Etiology of Diabetes Insipidus, and Dr Foster Kennedy, New York City, on

"Neurology and the General Practitioner". The attendance was a very good one, and in cluded a number of guests as well as the officers and members of the State Society.

One of the most important events which has occurred in the District during the year is the establishment of a County Health Unit under the direction of Dr Matthias Nicoll, Ir

Respectfully submitted,

George B Stanwix, President April 1, 1930

#### REPORT OF THE THIRD DISTRICT BRANCH

To the House of Delegates— Gentlemen

The twenty third annual meeting of the Third District Branch was held at the Golden Rule Inn Mirror Lake Ulster County, as the guests of the Ulster County Medical Society About seventy-five members of the Branch were present, including representatives from every County in the Branch

The scientific session consisted of addresses on, "The Medical Profession—Economically Speaking" by Dr Shirley W Wynne Commissioner of Health New York City, "America Practices Medicine," by Dr George F Chandler of Kingston, "Periodic Health Ex-

aminutions 'by DirC Ward Crampton, New York City. There were also addresses by the State Society officers following a dinner which was served at 2 30 P M

The mectings of the various county societies have been better than in former years and an increising interest is being shown in the various problems of the medical profession, economically as well as professionally. A few of the counties have had special courses of lectures as provided by the Committee on Public Health ind Medical Education. These courses have been well attended and indicate that the profession will attend these courses when they are offered something worth while

Committees on Public Health have been organized in all the counties and under the leadership of the efficient Chairman of the State Committee have been doing good work.

The membership of the Branch remains

about the same.

Several meetings of the Executive Committee have been held and various matters of interest to the Branch acted upon.

Albany County has invited the Branch to

hold its annual meeting at Albany in the fall and the invitation will probably be accepted. Those who remember the last time the Branch met in Albany will remember what a royal time was had and the meeting this year promises to be as entertaining.

Respectfully submitted,

EDGAR A. VANDER VEER, Chairman.

April 1, 1930.

## REPORT OF THE FOURTH DISTRICT BRANCH

To the House of Delegates—Gentlemen:

During the year some outstanding pieces of work have been done by some of the county societies of this district.

Perhaps the most conspicuous was the stand taken by the Warren County Medical Society in favor of chlorination of the water of the city of Glen Falls. Attention had been called to the necessity by the State Health Department and a request had been made by the State Commissioner of Health. The county society met, passed resolutions upholding the hands of the Commissioner and further had the courage to make outspoken criticism of the city officials for attempting to put their lay opinion up against competent medical advice on a sanitary problem. The society through a committee published a long article in the Glens Falls papers setting forth the scientific aspects and dangers of water pollution in plain, understandable, everyday English. The article was a masterpiece of clarity. The county society's strong position in the matter was a great credit to organized medicine.

Clinton County Medical Society has been conducting a survey on maternity. Each patient attended in the county by a physician is to be investigated. A questionnaire on each case is being filled out by the doctor. The facts which this survey will show are not yet available.

Saratoga County Medical Society through a committee have conducted a survey of defects of school children in that county. An interesting and instructive report was made by Dr. J. F. MacElroy on this work at the annual meeting of the Branch at Saratoga on September 20th. Some appropriate action is anticipated looking to the correction of defects found. Dr. MacElroy's paper is worth study.

Washington County Medical Society continued their ardent support of the state-aided project in public health. This last year conducting a special demonstration on maternity and prenatal work. The work was approved by the County Society and participated in by

them. The attempt to get prospective mothers into the hands of their physicians at an early date so that proper prenatal supervision could be given was stressed. A course of lectures on physiotherapy was given by the State Society during May at Hudson Falls. In October a course on Internal Medicine was held in Cam-

bridge and Hudson Falls.

Montgomery County Medical Society has been thinking of a county health unit and one meeting has been devoted to discussion of the scheme; Dr. James S. Walton presenting a paper on "The Cost of a Health Unit" and Dr. Charles Stover a paper on "The County as a Unit Organization." The Society voted that the committee make a report as to what the actual cost would be for such a unit in Montgomery County.

St. Lawrence County Medical Society conducted a course of lectures and reported that the Committee on Public Relations is becoming

active.

At the annual meeting at Saratoga on September 19th and 20th, 1929, the Governor's special committee on Saratoga Health Resort was present. Mr. Bernard Baruch gave a report to the Branch of that committee's activities. This was followed by discussion and suggestions of the doctors as to how the work should be carried on. Mr. Baruch said in no unmistakable terms that he would not consent to any project except it be under competent medical supervision and that no patients would be given baths or cared for without a doctor's prescription.

The scientific program on Thursday afternoon, September 19th, was in charge of the Saratoga Springs Commission, and consisted of short addresses by the Honorable Bernard M. Baruch, Chairman; Senator John Knight; Speaker Joseph A. McGinnies; moving pictures and stereopticon views of the present and proposed reservation by J. G. Jones, Superintendent; and a special trip through the reservation with demonstration of baths, hydrotherapy, etc.

The evening was devoted to a banquet at which Dr. Francis R. Packard of Philadelphia,

speaker of the evening, gave an address on Ambroise Paré.

Friday morning, September 20th, was devoted to the following addresses: "Child Welfare Survey of Saratoga County," by Dr. John R. MacElroy, Jonesville; "The Diabetic in General Practice," by Dr. Leo Schiff, Plattsburg; "Periodic Health Examination," by Dr. C. Ward Crampton, New York City; and "Gastric and Duodenal Ulcer," by Dr. Frank H. Lahey, Boston, Massachusetts,

> Respectfully submitted, WILLIAM L. MUNSON, President.

April 1, 1930.

#### REPORT OF THE FIFTH DISTRICT BRANCH

. To the House of Delegates-

Gentlemen:

Medical affairs in the Fifth District Branch are in a thriving condition. Most of our County Societies are having good attendance at every meeting, with scientific programs that are decidedly attractive and committee work that stirs general interest. Of the seven counties. and Jefferson hold meetings Onondaga monthly.

Onondaga County Society has approved the recommendation of their Public Health Committee in favor of a county health unit for Onondaga, and their recommendation has gone to

their Board of Supervisors.

Oneida County Society has had a year of intensive propaganda for periodic health examinations. This propaganda has been carried out by a super active lay organization in cooperation with the Public Relations Committee of the County Society. Their program bids well to produce excellent results in the near future.

During the year, courses in Industrial Medicine have been given at eight different industries, comprising six different subjects, by members of the County Medical Society and the Utica Dental Society, under the auspices of the Industrial Secretary of the Y.M.C.A. This activity was arranged and supervised by the Public Relations Committee and the reports reaching that Committee, from the Industries, have been very gratifying.

At the present time, the Oneida County Medical Society is working on details of a county health unit, with the expectation of recommending such a proposition to the Board

of Supervisors.

Lewis County Society has been active in securing the new hospital to be built at Lowville. Heretofore, there has been no hospital in this county.

Jefferson County Society assisted in the campaign for the \$150,000 childrens' pavilion which is to be added to the County Tuberculo-

sis Sanatarium.

Onondaga, Oneida, Oswego and Jefferson Counties have all had post-graduate courses in the past year, and more are planned for 1930. The best attendance is always obtained at these lectures.

Toxin-antitoxin committees have been actively working. In Jefferson County in the first half of 1929, 4,320 pre-school children were

given toxin-antitoxin.

The annual meeting was held in Watertown, October 17th; Dr. Armitage Whitman of New York, Dr. James P. O'Hare of Boston, and Dr. William P. Van Wagenen of Rochester, N. Y., were guest speakers. The President of the State Society, the Speaker of the House of Delegates, and other officers were present. Each made a brief address concerning the work of organized medicine.

At the election of officers, Dr. Augustus B. Santry of Little Falls, was elected President; Dr. Edward R. Evans, Utica, 1st Vice-President; Dr. William A. Groat, Syracuse, 2nd Vice-President Dr. William J. McNerney, Syracuse, Secretary; Dr. Hermann G. Germer. Canastota, Treasurer.

Respectfully submitted,

PAIGE E. THORNHILL, President.

April 1, 1930.

#### REPORT OF THE SIXTH DISTRICT BRANCH

To the House of Delegates-

Gentlemen:

The Executive Committee of the Sixth District Branch, the Presidents of the component County Societies of the Branch, and Dr. Joseph S. Lawrence, Executive Officer of the State Society at the invitation of the President attended a luncheon at the Elmira City Club, June 25th, 1929, for the purpose of discussing the condition of the District and formulating plans for the Annual Meeting.

An invitation received from the Cortland County Medical Society, to hold the Annual Meeting at Cortland as their guests, was ac-

cepted. At the Annual Meeting held September 27th the attendance was one of the largest in the history of our Branch, nearly 200 physicians registered.

The program was enthusiastically received, special interest centering in our guests' parts in the program, Dr. John B. Deaver and Dr. Lawrason Brown.

The election of officers was as follows:

President, Dr. George M. Cady, Nichols; First Vice-President, Dr. Stuart B. Blakely, Binghamton; Second Vice-President, Dr. John E. Wattenberg, Cortland; Secretary, Dr. Hubert B. Marvin, Binghamton; Treasurer, Dr. William A. Moulton, Candor.

The District was honored by having as guests Dr. James N. Vander Veer, President of the State Society; Dr. William H. Ross, President-Elect; Dr. Daniel S. Dougherty, Secretary; Dr. John A. Card, Speaker of the House of Delegates; Dr. Joseph S. Lawrence, Executive Officer. Each spoke briefly on State matters following the luncheon.

Respectfully submitted,

LA RUE COLEGROVE, President.

April 1, 1930.

### REPORT OF THE SEVENTH DISTRICT BRANCH

To the House of Delegates: Gentlemen:

The only activity of importance of the Seventh District Branch during the year was the annual meeting, which was held at Clifton Springs on September 26, 1929.

The scientific session was a most interesting one, including papers on "Coronary Occlusion," by Dr. Louis Hamman of Baltimore; "Spinal Anesthesia," by Dr. Frank A. Kelly of Detroit; "The Present Status of the Treatment of Arthritis at the Mayo Clinic," by Dr. Leonard G. Rowntree of Rochester, Minnesota; "Surgery of Tubercular Lung Abscess," by Edward W. Archibald of Montreal.

Owing to Dr. Frances Perkins', Commissioner of the State Department of Labor, inability to be present and present her paper on "The Medical Question in Compensation Administration," Mr. Zimmer of Albany, Director of the Bureau of Compensation, addressed the audience; his theme was that the medical profession should prepare the young physician, by special courses in medicine, to make satisfactory compensation examinations. An interesting discussion followed.

Following the luncheon which was served in the Clifton Springs Sanatarium, addresses were given on, "The Workman's Compensation Laws," by Dr. James N. Vander Veer, President of the State Society; and on "The Public Relations Committee," by Dr. William H. Ross, President-Elect.

Dr. Daniel S. Dougherty, Secretary of the State Society, and Dr. James E. Sadler, Chairman of the Committee on Public Relations were also present.

The following officers were elected for the ensuing two years:

President, Dr. E. Carlton Foster, Penn Yan. 1st Vice-President, Dr. C. Harvey Jewett, Clifton Springs.

2nd Vice-President, Dr. William D. Ward, Rochester.

Secretary, Dr. John A. Lichty, Clifton Springs.

Treasurer, Dr. Edward T. Wentworth, Rochester.

Respectfully submitted,

Austin G. Morris, President. April 1, 1930.

#### REPORT OF THE EIGHTH DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

The regular annual meeting of the Eighth District Branch was held on October 3, 1929, at the Buffalo City Hospital.

The morning was devoted to clinics by members of the City Hospital Staff.

The afternoon session consisted of addresses by the State Society officers, an economic paper by Dr. W. Warren Britt of Tonawanda; and an address by Dr. George W. Crile of Cleveland.

The following resolution, presented by the

Niagara County Society, was unanimously carried

Whereas:—Section 77, Article IX, Chapter Forty-Two of the Public Welfare Law, passed April 12, 1929, to become effective January 1, 1930, reads—"It shall be the duty of Public Welfare Officials, in so far as funds are available for that purpose, to provide adequately for those unable to maintain themselves. They shall, whenever possible administer such care and treatment as may restore such persons to a condition of self-support, and shall further give such services to those liable to become desti-

tute as may prevent the necessity of their be-As far as possible, coming public charges families shall be kept together, and they shall not be separated for reasons of poverty alone Whenever practicable, relief and service shall be given a poor person in his own home, the Commissioner may however in his own discretion, provide relief and care in a boardinghome, the home of a relative a public or pri vate home or institution or in a hospital

Whereas —Section 43, Article VI of the Public Welfare Law provides that, It shall be the duty of the Board of Supervisors of a County, the town board of a town, and the appropriating body of a city to make adequate appropriations and to take such action as may be necessary to provide the public relief re-

quired by this Chapter,' and

Whereas -Section 84, Article X of the Public Welfare Law provides that, "When a legislative body shall make an appropriation for the purpose, one or more physicians shall be appointed to care for sick persons in their homes In a county public welfare district, such physician or physicians, shall be appointed by the county commissioner In a city, such physician or physicians shall be appointed in accordance with the provisions of the local or general law relating to such city In a town, such physician shall be appointed by the town board Where no physician is so appointed, the public welfare official shall employ a physician or physicians to visit sick persons in their homes whenever necessary," and

Whereas —The above sections of the Law, by including "those liable to become destitute" with "those unable to maintain themselves," will afford medical relief to a large additional

number of persons, and

Whereas -Present methods of providing medical relief for such persons by sending them to the doctor for the poor or of having such an official call on them in home or hospital, is an antiquated custom which lays a stigma on those receiving its supposed benefits and thus prevents the needy from applying for medical relief, and

Whereas -Such methods are "not consistent with a well founded and rapidly-developing sentiment among welfare-workers that the family physician and family surroundings are more conducive to the restoration of health than any other artificial arrangements, no matter how well they may be planned" and

Whereas -Section 84, Article \ of the Public Welfare Law clearly permits the Public Welfare Officials to interpret and administer October 3, 1929, favor the designation of the patient's family physician or physician of his choice as the responsible active attending physician in each case of those unable to maintain themselves or liable to become destitute requir-

ing medical or surgical care,

Therefore, Be It Resolved, That the Lighth District Branch of the Medical Society of the State of New York at this regular meeting on October 3, 1929, favor the designation of the family physician or physician of the patient's choice rather than especially appointed sala ried physicians, as the proper, responsible, ac tive attending physician in each and every in stance of "those unable to maintain themselves" or of "those liable to become a public charge requiring medical or surgical care," and

Be It Further Resolved, That this resolution be transmitted to the Medical Society of the State of New York for its endorsement and support, and that the Public Welfare Officers, Boards of Supervisors and those responsible for the assignment of these cases be memorialized to take cognizance of these resolutions

The following officers for the two ensuing

vears were elected

President, W Ross Thomson, Warsaw 1st Vice-President, Raymond B Morris, Olean

2nd Vice-President, Frederick J

North Tonawanda

Secretary, W Warren Britt, Tonawanda Treasurer, Fitch H Van Orsdale, Belmont

Respectfully submitted,

THOMAS I WALSH, President April 1, 1930

Annual meeting June 2-4, 1930, Hotel Seneca, Rochester, N. Y.

#### ANNUAL REPORTS

The annual reports of the officers and committees of the Medical Society of the State of New York, which fill the entire scientific section of this Journal, are the expert opinions of the leaders in all lines of medical work in which the State Society is engaged. The unusual length of the reports is a demonstration that the Society is

practicing medicine more extensively and broadly than before. It is the experience of editors that doctors are over modest in their estimate of their own value to medical organizations. Certain it is that the State Society has had leaders who have given their time and energy in the unselfish promotion of progress in the practice of medicine.

#### PROGRESS OF THE YEAR

Marked progress in medical practice in New York State has been made during the past year along the line of co-ordinating the work of the various agencies. The object of the practice of medicine is the promotion of the health of every individual person; but in order to help the individual, action by the Society or the State may be necessary in addition to the doctor

The story of medical progress in group action is similar to that in charity and criminology. Philanthropic work in former years consisted only in the relief of individuals; but the modern view is that poverty and crime are relative terms. They have little meaning to the individual who lives alone; but their significance is apparent when the individual begins to live in close contact with his fellow men and is compelled to adapt his life to theirs. Modern philanthropy deals with societies and social practice quite as much as it does with the individual pauper or criminal.

Medicine was formerly concerned with individuals only. The modern era of group action in the practice of medicine began with the control and prevention of communicable diseases as a community measure. It extended to the municipal control of water, milk, and other foods, and to conditions of work in industrial establishments. It is now returning to the individual. It is reaching the mother and her baby and her children in the schools. The Public Relations Committee of the Medical Society of the State of New York is now making a study of the health service given to the students of colleges and universities of New York State. Employers of labor are making physical examinations of their workmen and providing medical service to the sick; and the State is exercising control over the compensation of workmen who are injured or sick. There is also the committee of the State Medical Society engaged in the promotion of a health examination for all adult persons. Then, too, the great field of mental diseases and mental hygiene is occupied almost entirely by the State, largely because physicians are unwilling to enter that field in their private practice.

A decade or two ago communism in the practice of medicine was a new thing, but it grew so rapidly and was so far reaching in its development that many physicians feared that it would displace the old system of private practice, as it had done in Germany and England with disastrous results. But fortunately the physicians of New York State recognized the need of the entrance of municipality and State into certain fields of medical practice; and at the same time the State recognized the need of an intimate contact of the individual doctor with the individual sick person, just as the philanthropist recognized the same principle in dealing with criminals and the poor.

The reconciliation of the antagonism between communism and individualism in medical practice has been an outstanding item of progress in the Medical Society of the State of New York during the past year. Physicians generally have come to recognize the desirability and necessity that municipalities engage in the practice of those forms of medicine in which group action is necessary, such as the control of tuberculosis and the examination of school children. On the other hand both physicians and social workers are also beginning to realize that every case of sickness or poverty or crime is that of an individual person, and its investigation frequently requires the sympathetic action of an individual expert, be he physician, socialist, or psychologist. Communism and individualism in medicine, starting in opposing directions, have curved their paths and have met a closed circle in a cooperative method in the practice of preventive medicine. The reconciliation of the two tendencies has been the prominent subject of discussion in nearly every standing committee of the Medical Society of the State of New York during the past year; and their fusion has been well nigh accomplished with a minimum amount of shock to the individual doctor and of destruction of his former methods and ideals.

The most troublesome question that remains to be settled is that of the economics of the newer form of practice. The people have not yet become accustomed to paying for preventive advice applying to the vague feature; neither have physicians generally acquired an altruism that is sufficient to inspire them to work without pay. Yet physicians have something to sell which the people need and which they would pay for if they really knew about it. Hence, the first step in the solution of the problem of the modern practice of medicine is that of advertising, or medical publicity. Fortunately, the doctor does not have to advertise his own wares directly, for a host of lay health organizations exists largely for publicity purposes and for educating the people in regard to the health services which physicians can give to them.

The Committee on Public Relations has developed methods of approach of the two groups which have been tested and standardized during the past year, so that they will be the basis for all future relations of the medical to the lay health groups. The most evident part which the doctor must take in the development and evolution is to prepare himself for an extension of his private practice into the fields of preventive medicine; and the most evident part which public officials and lay health organizations of a community must take is to adapt their methods to the system of medical practice approved by the organization of the physicians. If a department of health or a

lay health organization wishes to start a new field of preventive medicine, its natural course would be to consult the nearest organization of physicians. Whatever may have been the attitude of the two groups in the past, they rarely fail to enter into a working agreement when their representatives come together and talk over the details. It was so with the diphtheria prevention campaign, three years ago; and it is now true with regard to the summer round-up of pre-school children. It is also coming true with the relation of physicians to workmen's compensation.

Five years ago the Medical Society of the State

of New York took up the promotion of the practice of preventive medicine in a tentative way, and after a year or two of experimentation and trial, it began to develop suggestions for County Medical Societies to follow. The last two years has seen the warm response of the leaders of the county societies and the formal approval of their plans by an increasing number of medical organizations. The next step of progress will be that the county societies will reach their individual members and will influence them to enter the newer fields of practice which have already been opened to them.

# LOOKING BACKWARD THIS JOURNAL TWENTY-FIVE YEARS AGO

The Council on Pharmacy and Chemistry:— The reasons leading up to the establishment of the Council on Pharmacy and Chemistry by the American Medical Association on February 3, 1905, are given in the following editorial from the Journal of the A. M. A., quoted in the NEW YORK STATE JOURNAL OF MEDICINE of

May, 1905:

"Some thirty years ago there appeared one by one, preparations bearing coined names, protected from imitation by copyright or trademark, with formula more or less mysterious and fictitious—in other words, secret. By making extravagant claims and by persistent exploitation in various ways, the manufacturers induced physicians to use them, and as they were usually the simplest kind of mixtures, requiring little, if any, machinery or skill in their compounding, and being composed of inexpensive drugs, the profits were large. Thus the field for commercial enterprise became an enticing one. The manufacturer might be an individual with no pharmaceutical knowledge and with his identity hidden under the anonymous name of some chemical company; thus, the better to impose on the credulous doctor,

he combined the secrecy of his preparation with the mystery surrounding its manufacturer. With their fancy therapeutic or disease-suggesting names and with extravagant claims regarding their therapeutic value, these medicines appealed to a certain class of doctors; they were convenient, palatable, and, at least, satisfactory placebos. Further, they saved the doctor the trouble of writing a full prescrip-It was not long, however, after these preparations became popular with the physician before they became popular in the true sense. The fancy, catchy names which caught the physicians caught the layman as well, and the latter, finding not only full directions for . use, but the names of the diseases in which the remedies were indicated, naturally bought them in preference to the so-called 'patent medicines,' for were these medicines not endorsed by the 'faculty,' and had they not testimonials from 'the most prominent physicians?' Thus the physician became the unpaid peddler of secret nostrums; thus he encouraged his patient to prescribe for himself, and thus, as the secret nostrum manufacturer became richer, the physician became poorer."

## MEDICAL PROGRESS

数

Treatment of "Tennis Elbow"—Thomas Mar lin points out that the condition designated by the term "tennis elbow" may be induced by many other activities and occupations in which the gripping muscles are brought into play. In his experience no treatment is so successful as manip ulation of the elbow joint. The patient being on his back, the arm just off the table, with the hand midway between pronation and supmation, is held between the operator's legs The elbow rests in the operator's hands and is passively flexed and extended several times Then when the muscles are relaxed, the elbow is sharply forced a little further into extension, the operator being careful to stop immediately extension is reached anesthetic is necessary A snap is usually heard during the manipulation, this does not mean that a dislocation has been reduced, but that the radius had become fixed somewhere within the normal range of movement The manipulation having been effected, the muscles should be coaxed into a condition of relaxation and freedom of action The patient may be allowed to play or make any natural effort that tends to concentrate his mind on the game or activity and to forget his muscles Then they suddenly begin to act in a smooth nor mal manner and tend to lose their spism. Strap ping is a great aid at this stage of the treatment During the application of the strapping the patient keeps the elbow bent and the wrist pronated and the fingers flexed. The strapping has a piece cut out to allow hending of the elbow. The majority of cases will clear up with these meas Any remaining pain, however, may be treated by the different electrical methods-diathermy, ionization, light therapy, faradism, galvanic acupunture. In the application of acupuncture an indifferent electrode is fixed to any part of the patient's body, and a small active electrode stroked over the punful areas. A minimal faradic current is used and a search is made for the most punful point. A galvanic current is then substituted for the faradic and a needle attached to the negative pole is inserted directly into the tissues, the current being turned on gradually until two miliamperes are registered. Two or three painful places may be treated at one sitting -The Lancet. March 8, 1930

Treatment of Ozena—Professor Denker of Munich says that more than 170 articles on ozena have appeared during the past three years. The term is employed in the broad sense of a chronic nasal disease with a fetid secretion which dries rapidly into crusts. However, if the atrophy stops at the mucosa the term ozena is hardly justified. Chronic sinus disease may be attended with an odor but this is apt to

persist after removal of the dried secretion, while in true ozena the foul odor is limited to the crusts themselves Under the head of conserva tive treatment the author, having enumerated a great variety of remedies, recommends the Gottstein tamponade, irrigations by Sauter's method involving alternate closure of the nasal fossæ, and the so called antivitamin treatment of The latter comprises the use of Glasscheib vitamins A and D Irradiation is of no value The effect of atrophy of the nasal bones is to enlarge the nasal chambers and various proced ures have been recommended to reduce their Implantation of unorganized substances as well as of hone has been practised, but until recently there have been no standard results The Eckert-Mobius technique, however, has been carried out in many more than 100 patients at the Halle University Clinic within the space of six years Slivers of spongy beef bone spe cially prepared may be implanted under local anesthesia within 10 or 15 minutes in a pocket established between the mucosa and periosteum and heal in without contraction thus narrowing the nasal fosse for their entire extent oldest and worst cases, more major intervention is called for and half a dozen procedures are described although without any statistical back-The same principle perhaps underlies all of the methods, for the idea is to mobilize the entire lateral wall of the nasal fossa and shift it over toward the septum thus securing the desired partial closure of the fossa. One of the acces sory features of this intervention as carried out by some authors is to lead off the parotid secretion into the nose -Deutsche medizinische Wochenschrift, March 7, 1930

Weather Sensations -H J Schmid strives to connect weather changes with a definite physiological action A distinction must first be made between effects on the psyche and somatic symptoms, the two of course often being associated The author limits his subject to somatic symptoms and such psychic ones as are secondary Thus far we can hardly speak of a to them definite physiological action of the weather Frankenhauser has isolated groups of symptoms referable to special organs. Thus there is a congestive cerebral syndrome which comprises pros tration, relaxation, irritability, insomnin or som nolence, anxiety, headache, ringing in the ears vertigo, epistaxis, etc. This shows a sort of parellelism with migraine and suggests a liability of the vegetative nervous system. There is a definite pattern in these symptoms yet they are not at all peculiar to or characteristic of the weather A second group is referred to the gistroenteric

tract and comprises loss of appetite, foul breath and coated tongue, constipation or diarrhea, etc. It is evidently of the same origin as the cerebral syndrome with which it may often be associated. A third group which is quite distinct from the first two comprises myalgias, neuralgias, arthralgias, pain in scars, corns, etc. In seeking a rationale for these functional and subjective manifestations it is difficult to exclude the effects of suggestion. In addition to the preceding we see in sufferers from chronic affections certain weather exacerbations, such as the crises of angina pectoris, hemoptysis in the tuberculous, laryngeal The relationship of the weather to crises, etc. crime, suicide, prison outbreaks, etc., as recorded by Franklin Dexter is of interest, for as a rule weather influences have not been subjected to statistical treatment. Actual decisive factors such as humidity, barometric pressure, the electric conductivity of the air, solar radiation, etc., may each have their effect. Most of these causal factors seemingly act on the vegetative nervous system, but electric conductivity may be responsible for the muscle, nerve, and joint pains.-Schweizerische medizinische Wochenschrift, March 1, 1930.

Chronic Arthritis.—In view of the obscurity of the immediate cause of chronic arthritis, A. A. Fletcher urges that more attention be given to the predisposing causes. Clinically, some of these are heredity, constitution, fatigue, environoccupation, previous disease, anxiety age, sex, and, probably most important, malnutrition. A review of the literature shows that the belief is not new that chronic arthritis and malnutrition are related. A study of patients with arthritis carried out nine and ten years ago by the writer convinced him that much was to be accomplished by a readjustment of diet balance and also by a liberal administration of vitamins. A high incidence of colonic disturbances has been observed in a large group of patients in the medical wards of the Toronto General Hospital. The study was begun in the belief that colon disturbances were nutritional in origin and that patients showing these lesions would be those which experience most benefit by diet therapy. Atony is most frequently seen and haustral markings may be decreased or even absent. may be a marked increase in the length of the colon, resulting in looping or festooning. Improvement in the x-ray appearance of the colon has been brought about by certain specific changes in the diet. Vitamin B has been given in large The total calories have been reduced to a maintenance or, in suitable cases, even below a basal level. The effectiveness of vitamin B seems to vary indirectly as to the amount of the total diet. Carbohydrate, especially, seems to inhibit its effectiveness. As a rule, 50-70 grams of protein is given in the form of meat, fish, fowl, eggs, milk, and glandular food; carbohydrate is reduced to 50 grams, and the fat varies from 50 to 150 grams, according to the individual requirements. With this treatment, the disturbances of the colon are benefited, the arthritis may become quiescent, and in some patients clears up entirely. Good results were also seen in patients with rheumatoid arthritis, osteoarthutis, and so-called arthritis of the menopause. If the disease is infectious, it is probable that malnutrition at times creates the state favorable to the development of this infectious process. In other cases the colon is probably the source of the infectious or toxic agent causing the disease.—Canadian Medical Association Journal, March, 1930, xxii, 3.

Protection Against Mosquitos Through Animals.—Dr. J. Legendre writes with special reference to conditions in the French tropical possessions, in which various species of the Culex and Anopheles prefer the animals—the pig, cattle, buffalo, horse, etc.—to mankind for nourishment. These zoophile insects also attack wild birds and poultry. Those who care for the animals may be but little bitten because of the preference of the insects for the cattle, sheep and goats. Cases are particularized of various household pets which have been severely stung although in some cases at least they seem to pay no attention to the mosquitos, which do not even arouse them from sleep. On the other hand the author's personal experience in Senegal has shown him that certain insects which bite mankind ignore the domestic animals and fowls completely, although possibly this only holds good for certain hours of the day. It is largely a matter of affinity and while in one locality Culex mosquitos may be more zoophile than Anopheles, the reverse is equally in evidence in other localities. As some of the insects attack mankind alone there is reason to surmise that others may have a special predilection for certain species of animals. But this may readily be lost in captivity for the author saw captive specimens of Stegomyia fasciata—the mosquito which transmits yellow fever and dengue and does not attack animals when in the free state—feed on laboratory rodents and a cat. The aim of the author is apparently not to secure prophylaxis of the animals against the mosquito but to make use of animals as far as possible to sidetrack the insects. There is no mention that the mosquito can cause any disease among the animals while, as has been mentioned. the latter seem to possess considerable immunity to annoyance from the bites.—Bulletin de l'Académie de Médecine, February 25, 1930.

Reduced Iron in Certain Anemias.—Hans Schulten states that the brilliant results of the liver treatment of pernicious anemia have aroused new interest in the use of iron, once regarded as specific but more recently almost abandoned. Certain preparations of iron in special doses may still possess virtues in certain types of anemia. Thus after extensive blood losses there is usually a

spontaneous recovery within a certain interval, but when after a delay of 3 or 4 weeks regeneration of the blood is still in abeyance it is well to make use of some artificial aid. Iron has long been and still is utilized in such cases but often, it is admitted. without benefit. In such failures the dose has not usually been increased, as the total amount of iron necessary to the animal economy is very small, but the author has been increasing his dosage of reduced iron in such cases without causing any disturbance of the alimentary canal. He has given as high as 6 gms. in 24 hours in divided doses and often with brilliant results, improvement setting in promptly. Other forms to benefit have been genuine chlorosis and achylic chloranemia. The author applies the generic term hypochrome anemia to these forms by reason of the relatively low hemoglobin content of the blood. The rationale of large doses of iron in these cases is not apparent. Reduced iron is not chemically pure and in such large amounts there may be contained other mineral elements which act in synergism with the iron. In feeding anemic rats it has been learned that traces of nickel, copper, etc., when added to iron secure results not obtainable with pure iron. In delayed regeneration following hemorrhage and in chloranemia with achylia gastrica the large doses of iron are specifically indicated if smaller ones will not do the work, and even more than 6 gms. daily has been given-the author mentions 10 gm. in one case. In genuine chlorosis the large dose does not seem to be necessary .- Munchener medizinische Wochenschrift, February 28, 1930.

Causation of Gastric Ulcer.-L. Moszkowicz of Vienna makes an attempt to digest some of the recent publications on this subject with a view of arriving at some conclusion which will tend to clear up the present day obscurity. Büchner and Silberman, while admitting the prejudicial action of hyperacidity of the stomach contents, claim that such noxious action is exerted only in the pyloric region and along the lesser curvature. This conclusion is not a novel one but Silberman insists that the gastric juice which is chiefly responsible for the erosions is psychic juice socalled. Such a view automatically excludes all theories based on vascular anomalies, such as capillary embolism, necrosis, and preulcerous organic lesions of any kind. Treatment must therefore be directed against the psychic factor and perhaps an allergic component. The views of the two authors in question are based on prolonged experimentation. One of the competitive views of the day is that of Konjetzny which has some adherents and which involves the preexistence of gastritis of a type which can be visualized only from histological pictures. This, in turn, would supplant the older view that for an ulcer to form there must have been some devitalization of the mucosa from intravascular causes. When the author began his own studies in 1922 he espoused this last-named theory but relinquished it when convinced by Büchner and Silbermann. Particularly convincing are the experiments of the latter on dogs subjected to sham feeding à la Pavlov. The juice secreted in this experiment comes under the head of psychic juice and he found it 5 fold stronger in acidity and digestive power than non-psychic juice. After the dogs had been subjected daily for considerable intervals to sham feeding they developed both pyloric and duodenal ulcer although all other portions of the stomach and intestine remained immune. Thus far there is no similar evidence to explain human peptic ulcer.—Klinische Wochenschrift, March 1, 1930.

The Connection Between the Functional Activities of the Liver and the Susceptibility of the Organism to Insulin. - Experimental studies conducted by Erik Forsgren indicate that the liver has rhythmically acting functions, to a certain degree independent of the supply of nutrition, with alternate assimilatory and secretory, or dissimilatory, stages. During the dissimilatory stage, in which glycogen is deposited in the liver cells, the liver is a glucose consumer; during the secretory stage, in which glycogen disappears from the liver cells as these are required for the secretory and dissimilatory activities, the liver is a glucose producer. Because of its great capacity, the liver will, in a condition of moderate nutrition, dominate the metabolism. An individual's susceptibility to insulin is determined not only by his food intake, but also, and much more, by the state, to a certain degree independent of the food ingested, in which the metabolism happens to be in connection with the rhythmic activity of the liver. Susceptibility to insulin is greatest after the final phase of the secretory stage of activity, when the glycogen has disapepared from the liver, and least after the final phase of the assimilatory stage of activity, when the liver is rich in glycogen. The rhythmic functioning of the liver in the rabbit is still in evidence after twenty-four hours' fasting, which explains the varying susceptibility observed in standardizing insulin on the rabbit. In diabetics there are frequently seen nutritionally paradoxical rhythmic variations of the insu'in susceptibility and the sugar content in the blood and urine. These phenomena have possibly some connection with the rhythmic functioning of the liver. According to the author's experience, the insulin susceptibility is, as a rule, least in the morning and evening, and greatest at about 2 P. M. The conclusion to be drawn from this is that the administration of insulin in the treatment of diabetes should be made dependent on the internal metabolism, which can be studied through the variations of the sugar content in the blood and wrine at different hours of the day .- Acta Medica Scandinavica, February 28, 1930, 1xxiii, 1.

Treatment of Gastric Ulcer with Insulin Injections.—A. Cade and Ph. Barbal refer to the original use of insulin in this affection in

1926 by Feissly. One case only was reported but this had defied all the usual medical resources. In 1927 Goyena secured a second cure with complete cicatrization, while in 1929 Horowitz reported a third case with radiographic cure, i.e., disappearance of the niche which is characteristic of gastric ulcer. Simnitzky, who reported an entire series of cases, claims only improvement. The authors have a series of cases, 25 in number, gastric and duodenal ulcer being alike represented, inclusive of all cases presenting themselves without attempt at selection. diagnosis was assured by clinical symptoms, röntgenograms, and operative finds. All of the cases were chronic and many of long duration. In a group of 10 patients after diet and bed rest had failed the treatment comprised insulin alone with liberal diet and without bed rest. Each morning 15 units of insulin were injected, the treatment being continued, when possible, for a period as long as 25 days, although some patients were discharged prematurely. The improvement was striking, but the interval is too short to speak of cure. In a second group of 6 patients insulin alone was of no avail, but if glucose was also given by the mouth the improvement secured was superior to that obtained by the conventional treatment. A patient with pyloric stenosis showed only temporary improvement under insulin and In another group of four patients there was no benefit from insulin-glucose, although no explanation was forthcoming. Finally another small series, also of 4 patients, could not for one or another reason be placed. Thus one disappeared from treatment, while the others showed certain complications not associated with In summing up, the authors prefer not to speak of cures but of relief, especially of the dominant symptoms. Thus far we have no theories to account for this action of insulin-Bulletin de l'Académie de Médecine, February 18, 1930.

Practical Value of Arteriography. — J. Schüller, in a brief illustrated sketch of this subject, states that it was first carried out on the living by Berberich and Hirsch in 1923. Thus far it has been limited to arteriography of the extermities, abdominal aorta and branches, and arteries of the brain, using lipiodol and strontium bromide, but chiefly sodium bromide. But few men have reported their results during the past 7 years and the author limits himself to a case of arteriography of the femoral artery. patient was a man of 34 who sustained an injury from his motorcycle, for which he was given treatment for fracture (splints, sandbags, and adhesive plaster extension). When the author saw him the feet were livid in places, there was no pulse in the popliteal artery, and there was evidence of approaching gangrene. The fracture at the junction of the middle with the lower third of the femur was ununited, as shown by the röntgen examination. The fragments were ad-

joined under ethyl chloride. As the foot could not be saved an amputation was performed at the junction of the middle and distal thirds of the leg. An abscess formed in the stump and discharged necrotic tissue. It had not closed when the patient was discharged and the sinus could be probed as high as the tuberosity of the tibia. Another accident resulted in a refracture of the femur and it was necessary to cut down on the site to set it. On account of the poor nutrition of the stump the femoral artery was injected through a cannula with a 4 per cent sodium iodide solution and a röntgen plate was made. artery was found to be embedded in some callus All structures below the fracture formation. showed atrophy-bones, muscles, etc. There was nothing to do but amputate at the site of the fracture; this was done 5 days after the picture was taken and a smooth healing resulted. Examination of the specimen showed that the choice of intervention had been justified and that any more conservative procedure would have meant months of hospital sojourn at the least.—Münchener medizinische Wochenschrift, February 14, 1930.

Trophic Lesions Following Encephalitis.— E. Baumann speaks of the extreme infrequency of this sequela of epidemic encephalitis. case of ulceration has recently been reported by E. Schlittler, who was able to find but a few analogous data on record. The present author has duplicated this observation in a boy aged 15 years, the original diagnosis of tuberculous meningitis having proved to be an error. The appearance of an ulcer on the tip of the tongue as a remote sequel again suggested tuberculosis but a microscopical examination was negative. The change in character was of the type seen after encephalitis and it was thought for a time that the lesion was an artefact, maintained by the interference of the patient. It had probably originated in a bite and contact with the teeth had aggravated it. This lesion persisted a number of years and biopsy and other resources excluded tuberculosis, syphilis, and malignancy. But despite the mechanical factor there had been no apparent effort on the part of the lesion to heal. The mass was excised under local anesthesia and the operation wound promptly healed. Study of other recorded cases—there are about six quoted—appears to show that a trophic factor is involved although artificial irritation played a role in some of them. Diagnoses by hospital pathologists in some of the cases were syphilis and epithelioma. The objection that in encephalitis trophic nerve fibers are not involved is met by the author with the statement that there is no absolute proof that trophic and vegetative nerve fibers are alone responsible for trophic ulcers. - Schweizerische medizinische Wochenschrift, March 15, 1930.

## LEGAL

## DEFENDANT'S RIGHT TO X-RAY EXAMINATION OF PLAINTIFF IN PERSONAL INJURY ACTIONS

By Lorenz J. Brosnan, Esq. Counsel, Medical Society of the State of New York

In an action for personal injuries, it sometimes becomes very important for the defendant, in order to adequately prepare for the trial of the action, to be accorded an opportunity to have a physical examination made of the plaintiff with a view to ascertaining the accuracy of the plaintiff's claimed injuries.

The statute governing the defendant's right to have a physical examination made of the plaintiff in a personal injury action, is Section 306 of the Civil Practice Act which provides

so far as material:

"Physical examination. In an action to recover damages for personal injuries, if the defendant shall present to the court satisfactory evidence that he is ignorant of the nature and extent of the injuries complained of, the court, by order, shall direct that the plaintiff submit to a physical examination by one or more physicians or surgeons to be designated by the court or judge, and such examination shall be had and made under such restrictions and directions as to the court or judge shall seem proper."

Interesting questions have arisen under this statute as to exactly what type of examination the defendant may compel the plaintiff to undergo. In this editorial we shall take up the question of defendant's right in a proper case to compel the plaintiff to submit to an x-ray

examination.

This question first came before one of our appellate courts in the year 1914 under the following circumstances: The plaintiff had brought an action to recover damages for injuries alleged to have been sustained to the plaintiff's right foot through the negligence of the defendant, it being claimed that the latter ran over the plaintiff's right foot with a heavy wagon, crushing the bones, etc. The plaintiff consented to a physical examination by a physician nominated by the defendant, and such examination was had.

Subsequently the defendant procured from the court below an order compelling the plaintiff to have an x-ray picture taken of her right foot. From this order the plaintiff appealed. The Appellate Division by a divided court reversed the order below, holding that: "The examination of witnesses before trial is purely statutory, and authority for a physical examination."

nation of a party to an action does not include authority to take photographs or x-ray pictures of the party, and this is specially true where the defendant has already, by consent of the plaintiff, had the advantage of a physical examination."

As an indication that the law does progress, it is interesting to note that just ten years later the same Appellate Division reversed its prior holding to the effect that there was no right in the defendant to compel the plaintiff to submit to an x-ray examination in a personal injury action. In its opinion the court referred

to its prior ruling and said:

"So far, however, as the opinion of this court in that case indicated that the court was without power to require such an x-ray examination we are unwilling to continue to follow it. That decision was rendered just ten years ago and since that time there has been such a perfection of the science of taking such x-ray pictures that their use, particularly in determining the presence and extent of bone injuries, has become universal and is the accepted method in the best medical practice. Any danger of burning or other bodily injury, when proper apparatus is used and skillful practitioners are employed has apparently been eliminated. Our present view is that it is not beyond the power of the court to require it in a proper case, but that its use may be required under proper safeguards whenever, in the exercise of its discretion, the court deems that the issues between the parties and the advancement of the science of the use of such apparatus fairly indicate the justice of requiring it in any particular case."

The decision of the Appellate Division just referred to is clearly sound and represents not only common sense and good logic, but is in harmony with the spirit and purpose of the statute pertinent to the subject-matter of this

editorial.

Curiously enough, in 1923 just a year prior to the decision above quoted, the Appellate Division in another Department by a divided court refused to compel a plaintiff in a proper case to submit to an x-ray photograph, on the ground that an x-ray examination was not an thorized by Section 306 of the Civil Practice Act.

However, the salutary effect of the decision

in the appellate court which gave the defendant a right to an x-ray examination of the plaintiff, was seen in-a decision reached in 1927 in the Supreme Court of Westchester County, where in granting a defendant's motion the court said:

"I am not unaware of the decision ... wherein the Appellate Division in the Second Department, by a divided court, held that section 306 of the Civil Practice Act did not authorize the court to direct the plaintiff to submit to an x-ray photograph; but my attention is called to the case ... where the Appellate Division in the Third Department, in 1924, reached a contrary conclusion, and in that very well-reasoned opinion reference was made to the fact that, since an earlier decision of that department, rendered some ten years before, holding such an order to be unauthorized ....

there has been a perfection of the science of taking such x-ray pictures, and that their use, particularly in determining the presence and extent of bone injuries, has become a matter of universal use, the accepted methods in the best medical practice, and the danger of burning or other bodily injury, when proper apparatus is used, have been eliminated."

This latter decision was followed in 1929 by our Appellate Division in New York City, and hence it is at this time generally well established in this State that in a proper case and under proper supervision a defendant may compel a plaintiff to submit to an x-ray examination. It is clear that this should be the law, as there are many cases where, without the use of x-ray, a physical examination of a plaintiff in a personal injury case would be entirely inadequate to establish the truth or falsity of the injuries claimed.

# FACIAL PARALYSIS RESULTING FROM CLAIMED NEGLIGENCE IN A MASTOID OPERATION

In this case the plaintiff called at the clinic of a hospital in New York City where she was examined. It was ascertained that she suffered from acute right otitis media. Arrangements were made for the ear-drum to be pierced. Under a local anæsthesia the house surgeon, under the supervision of the defendant, incised the car-drum. The patient remained in the hospital for one day. Three days thereafter the patient returned complaining of continued pain in the right mastoid region. An X-ray examination of both mastoid regions was made, which revealed an involvement of the mastoid cells of the right mastoid bone.

Another complete examination of the patient was made which confirmed the right mastoid involvement plus a rigidity of the face on the right side, which indicated a facial nerve involvement. The patient also complained of intense pain on the right side of the face.

A mastoid operation was suggested to the patient and the requisite consent obtained. On the same day the operation was performed. A general anæsthesia was administered and a simple mastoid operation performed by chiselling off the surface of the mastoid bone, uncapping the cells which were found filled with pus and granulation. The field was washed out with a saline solution. The skin over the temple was fastened by the use of Michel clips, and a gauze drain inserted. The patient came out of the anæsthesia satisfactorily and remained in the hospital for about ten days.

On the morning after the operation, one of the house surgeons reported a condition of paralysis of the right facial nerves. Upon examination it was found that the patient was unable to use the right facial muscles and was unable to close her right eye. The packing was removed and it was suggested to the patient that she attend at a neurological institute for the treatment of her nerve condition, which was refused.

The defendant-physician who performed the mastoid operation continued in attendance until the incision had completely healed, at which time the patient suffered no ailment except the inability to move the muscles of the right side of the face and control the right eyelid. At the time of the operation the defendant-physician's assistant carefully watched the operation and noted that the operation was carefully and skillfully performed. Further, he noted that at no time was the facial nerve exposed; that the instruments did not slip and no accident occurred.

The patient's face was carefully watched for a twitching of the muscles indicating an injury to the facial nerve, but none was observed. The operation lasted about one and one-half hours. About four hours after the operation the patient was resting quietly and showed no signs of facial paralysis, but facial paralysis

was noticed on the following day.

Sometime after the patient's discharge, she instituted an action against the surgeon who performed the operation, alleging that the plaintiff sustained facial paralysis as a result of the carelessness, and unskillfulness of the operating surgeon, by reason whereof the plaintiff sustained a permanent facial disfigurement. The action, however, never came on for trial and was duly dismissed, thereby terminating the proceeding in the doctor's favor.

## NEWS NOTES

#### GRIEVANCE COMMITTEE'S RULES ON REBATES

The Medical Grievance Committee of the Department of Education of New York State, formed in accordance with the Medical Practice Act of 1926, has adopted the following rules concerning the acceptance of rebates by

physicians.

WHEREAS. It has been called to the attention of the Medical Grievance Committee that individuals, firms and corporations, engaged in the manufacture or sale of appliances, instruments, trusses, lamps and other apparatus or equipment, have made it a common practice to pay, give and grant physicians advising or prescribing for patients the purchase or use of such articles, a commission or rebate on the purchase price or cost of the use thereof, which commission or rehate is generally paid to and received by the phy sician without the knowledge of the patient, and

WILLRIAS The Grievance Committee has been further informed that such commissions or rebates are likewise paid to physicians by chemical, analytical, pathological, radiographic and other

laboratories, and

WHEREAS The Gricvance Committee has been informed that such commissions and rebates are also paid to physicians by oculists on the price paid for spectacles and lenses, and by druggists on the price paid for patent medicines, prescribed medicines, drugs and other articles dealt in by druggists, and

WHERE'S, By the acceptance of such rebates or commissions, without disclosure to the patient, the physician conceals from the patient material facts which should be disclosed to the patient by reason of the relation between physician and pa-

tient, and

WHERE'S The acceptance of such commis sions or rebates, solicited or unsolicited, and even though disclosed to the patient, tends to commercialize the medical profession and to cast reflection upon its high standing and purpose,

Therefore, Be It Resolved That it is the sense of the Medical Grievance Committee of the State of New York that the acceptance of such commissions and rebates by practicing physicians is not alone unprofessional and unethical but that it may constitute evidence of "fraud and deceit" on the part of the physician, in the practice of medicine, within the purview of the Education Law (Medical Practice Act), and,

Be It Further Resolved That the aforesaid preambles and resolutions be deemed a rule of the Medical Grievance Committee, duly adopted by it in accordance with the powers granted to the Committee by law, for the guidance of the Committee in matters coming before it for consideration and determination in which such commissions and rebates are involved, and,

Be It Further Resolved That a copy of the foregoing preambles and resolutions be forwarded to the Journal of the Medical Society of the State of New York and to the daily news papers of the State of New York, with the request that same may be published, to the end that knowledge thereof may come to the physicians of the State of New York and to the public in gen eral

> HAROLD RYPINS, M D Executive Secretary, Grievance Committee

#### BRONX COUNTY

\ regular meeting of the Bron\ County Medical Society, was held on March 19, 1930, with the President, Dr. Aranow, in the Chair

The following new members were elected Drs Cheri Appel, John Birkenhauer, Samuel Licberman, Sunon Oltsik, Sophia Rossum, Jacob Rubin, Leon Singerman, Jacob Faub, Jacob H Turner and Culbert I Van der Smissen

The Scientific Program then proceeded as follons

The Colon is a Health Regulator Origin.

Effects and Treatment of Some of Its Abnormalities (Illustrated), Sir Henry Gray, Royal Victoria Hospital, Montreal, Canada

The Paper was discussed by Drs. Jerome M. Lynch, L. Miller Kahn, Walter A. Bastedo and lolm I Kantor The discussion was closed by Su Gru

It was moved that a vote of thanks be extended to the reader of the Paper and to the gentlemen The motion was carried by a who discussed it rising vote

I J I ANDSMAN, M D , Secretary

#### STEUBEN COUNTY

The Spring Meeting of the Steuben County Medical Society was held in the Corning Club at the Baron Steuben Hotel, Corning, Tuesday, March 11, 1930.

Dr. Floyd S. Winslow, Vice-President of the New York State Medical Society, gave an instructive talk on (1) the constructive features of the activities of the State Medical Society, mentioning in particular the election of Dr. Madill to the State Board of Regents and the abolishing of examinations for physio-therapists; (2) Favorable legislation; (3) Vicious legislation.

Dr. O. W. H. Mitchell of the State Public Relation Committee explained the purpose and

functions of the local committees.

Dr. H. B. Smith, chairman of Steuben County Public Relations Committee, reported that a questionnaire had been sent to all organizations within the County which were connected with or doing health work, and that they had received a very favorable response.

Dr. Arthur Karl of Hornell, New York, gave an interesting paper on "The Early Diagnosis of Tuberculosis." This paper was supplementeded by the x-ray films which were demonstrated by Dr. Geo. Mitchell of Hornell, New York. Dr. D. P. Mathewson, Superintendent of the Pleasant Valley Sanatorium, opened the discussion.

R. J. SHAFER, M.D., Secretary.

### JEFFERSON COUNTY

The January meeting of the Medical Society of Jefferson County was in honor of Dr. G. S. Farmer of Watertown, whose eightieth birthday occurred on January sixth.

The meeting of February 13th, held at the Black River Valley Club, was in honor of Dr. D. C. Rodenhurst of Philadelphia, N. Y., who has been a member of the Jefferson County Society since October 7, 1879, and who still attends the meetings regularly. Dr. Byron Haskin eulogized Dr. Rodenhurst somewhat and related a few interesting instances of his practice during the past fifty years, and gave him a token from the Society. Dr. Rodenhurst then gave reminiscences of his experiences in the practice of medicine.

Dr. Lewis W. Heizer, Medical School Inspector, was elected to membership.

Dr. Paul Garvery, Professor of Neurology, University of Rochester, addressed the Society on "Convulsive Disorders."

The meeting was well attended, forty-four members being present.

At the regular meeting of the Medical Society of Jefferson County, held March 13th, the Postgraduate Course of lectures was arranged, the first address to be held April tenth.

Dr. E. W. LaFontaine was elected to membership.

The following memorial was adopted:

"Death has taken from our number Dr. Frederick Brooke Smith, a man of the highest type in the practice of his profession, devoted to the best interests of medicine, and keen to keep abreast to the needs of his patients. He gave himself zealously to the work, and had the confidence of his fellow practitioners, the affection of his patients, and the high regard of the community.

"A member of this Society for about fortythree years and a former president, he fulfilled his obligations faithfully and ably in every capacity.

"The son of a physician, and early imbued with medical ideals, he loved his chosen work; and, though he had no financial need, he continued to devote himself to practice long after impairment of health would have excused him from its exacting demands.

"We shall greatly miss his helpful association and his able counsel based on sound learning, ripe experience, and well balanced judgment."

Dr. W. W. Scott, Rochester, N. Y., addressed the Society on "Bladder Tumors and the Significance of Hematuria," demonstrating his address with lantern slides. An interesting discussion followed.

Thirty-seven members were present and five guests.

Walter S. Atkinson, Secretary.

#### PRIZE ESSAYS

Attention of the members is called to the Merritt II. Cash and Lucien Howe prizes of One Hundred (\$100) Dollars each which will be open for competition at the coming Annual Meeting of the Medical Society of the State of New York for the best original contribution to the knowledge of surgery, preferably ophthalmology, and for

the best original essay on a medical or surgical subject.

Competitors for these prizes offered through the State Medical Society must send in their essays at once to Dr. Thomas H. Curtin, Chairman of Committee on Prize Essays, 391 East 149th Street, New York City.

#### CLINTON COUNTY

The Clinton County Medical Society has issued an announcement of its fourth post graduate course in connection with the Committee on Public Health and Medical Education of the Medical Society of the State of New York. The general subject of the course is Neurology. The lectures will be given alternately in the two hospitals of Plattsburgh. The program is as follows:

April 1—Lantern Slides and Moving Pictures in Pathology and Clinical Neurology—Dr. Lewis Stevenson.

April 8—Description of the Nervous System, Structural and Functional—Dr. Walter M. Kraus. April 15—Diseases of the Spinal Cord—Dr. T. K. Davis.

April 22—Degenerative and Neoplastic Diseases of the Brain—Dr. George Hyslop.

April 29—Vascular Diseases of the Nervous System—Dr. E. D. Friedman.

May 6—Epilepsy: and Symptoms of Affection of the Nervous System in General Disease and Injury—Dr. Foster Kennedy.

#### THE ANNUAL MEETING

The Headquarters of the Medical Society of the State of New York during the Annual Meeting on June 2-4, in Rochester, will be the Hotel

Seneca. There all the meetings and exhibits will be held. However, several other first-class hotels

in the vicinity of the Seneca will be listed and described in the next issue of this Journal. There will be abundant accommodations for all the doctors and their wives, as well as social attractions and entertainments between the sessions of the Society.

The rates in the Seneca are shown in the following table:

#### ROOMS FOR ONE PERSON

Running Water
Shower Bath 300, 3.50, 400
Tub Bath 3 50, 4 00, 4.50, 5 00
Combination Tub and Shower 4.50, 5 00
Parlor, Bedroom and Bath 10 00, 12 00
Sample Rooms 400, 4.50, 5.00, 600, 1000

#### ROOMS FOR TWO PERSONS

One	Double	Red

Running Water	\$4 00
Shower Bath	
Tub Bath 5.50, 600,	6.50, 7.00, 8.00

#### Twin Beds

Running Water	JJ
Shower Bath 60	Ю.
Tub Bath 600, 650, 7.00, 80	Ю
Combination Tub and Shower	ĸO.
m + m + 200, 140	v
Parlor, Two Bedrooms and Bath 1500 to 200	0
Parlor, Two Bedrooms and Date	

## THE DAILY PRESS

### TESTS FOR PREJUDICE

The New York Herald Tribune of April 14 reports a practical series of tests for the detection of prejudice, as follows:

"Dr. Goodwin Watson, professor of psychology at Teachers College, Columbia, released yesterday a psychological test which he has devised to test 'fair-mindedness' by measuring individual reactions to controversial questions and common generalizations. Dr. Watson calls his test 'a test of public opinion,' and recommends it to politicians, clergymen and sociologists who are anxious to gauge the minds of large groups of persons.

"The tendency of an individual to show prejudice is demonstrated in the test, according to Dr. Watson, when he deletes controversial words as disagreeable or annoying, by accusing sincere and competent persons whose opinions differ of being insincere and incompetent; by drawing from given facts conclusions in accord with individual bias, but unjustified by the facts; by rating all arguments on one side of a question as strong and the opposing arguments as weak; and by attributing to all members of a group characteristics true of only a part of the group.

The test asks an individual to strike out words in the following list which carry a disagreeable connotation for him: Bolshevists, Sunday blue laws, cigarettes, Ku-Klux Klan, censorship, prohibition, the Pope, radical, military preparedness, the I. W. W.

"Next follow statements to be rated according to the individual's impression of their truth or falsity. Among these are:

"Our government is controlled by great financial interests.

"'Poor men cannot get justice in the courts oday.'

"In a generalization test the individual is asked to underline 'all,' 'most,' 'many,' 'few,' or 'no' preceding a statement as 'Ministers' children are as well behaved as the average children of the town,' and 'Religious beliefs are unscientific.'

"Dr. Watson has already given his test in parts of the country, and found, he says, that groups of newspaper men in Western cities were capitalistic in their opinions, and that students in the Union Theological Seminary, New York, were radical. A journalism faculty in a Western university were tolerant in their moral standards, while seniors in a Middle Western high school were strict in their ethics. Secretaries of the Young Men's Christian Association in the Eastern cities held orthodox religious views, but the undergraduates at the University of Chicago were classed as 'modernists.'"

### BATTLING WITH LOCUSTS

An editorial in the New York Times of April 17 calls attention to the battle of El Arish on the shore of the Sinai peninsula where the British defeated the Turks in 1917, and continues:

"It is another enemy that has threatened Egypt during the past week, and the defenders have gone out to meet the invading hordes in the same desert area in which the Turks were met and driven back. The dispatch says that 'the heaviest fighting occurred around El Arish.' But in this battle it was man fighting his ancient and inveterate enemy, the locust. The Inspector General of the Egyptian Army was in command, and was accompanied by soldiers and men of the camel corps, but his chief of staff was an entomologist and their weapons were 'flame guns.' The trenches in this campaign were not for their own protection but for trapping the locust enemies, who

were destryoyed by millions as they advanced in serried bands and fell into the ditches.

"The scene as described in Monday's Times was with none of the horrors of war but with all its dramatic incidents: the blazing miles-long trenches, the flanking gunners shooting flames, the phalanxes of men in gasoline-tin armor, the square miles of charred locusts left on the battle-field. And all in the midst of terrific sandstorms and in the oppressive heat of the desert. It is a warfare which suggests some of the battles that civilization will have to continue to wage even after wars cease between man and man. Egypt has again been saved by a victory over the invaders at El Arish, or so it is hoped; but this time by an army under the leadership of an official protector of plants."

#### WHAT IS TIME?

The basis of all our knowledge is the experience which we have gained through the senses. New discoveries and demonstrations are founded on the recognition of phenomena that affect the senses. The mind reasons and forms abstractions by a comparison of facts learned by seeing, hearing, feeling, smelling, or tasting Such abstractions are those of space and time.

Einstein has developed new mathematical conceptions of distance and direction, and has suggested that space is curved on itself—whatever that may mean. And now Professor Gilbert N. Lewis, of the University of California, has gravely suggested that time, too, curves back on itself so that the beginning of the past merges with the end of the future. Commenting on this new idea, the New York Herald Tribune of April

21, says editorially:

"The idea of time which turns conveniently backward in its flight to aid the intellectual adventures of physicists, or rather of time with neither a forward nor a backward to provide distinction for a turning, as expressed by Professor Gilbert N. Lewis, of the University of California, in his paper made public in New York last week, will seem to common-sense people little more than wordy nonsense. It is worth remembering, however, that many fundamentals of science are but wordy nonsense, or what is still worse the symbolic nonsense of mathematics,

when viewed from the strictly limited outlook of common sense, an outlook which cannot transcend e perience of the human senses. It is no verbal accident, but a deep and important philosophical truth that the more usual kinds of reasoning are called 'sense' and the means by which this reasoning is attained are called 'senses.'

"Even to strictly common-sense physiologists it becomes increasingly evident that the human tody has many senses beyond the tradional five; some of them especially important precisely because their operations are so largely unconscious. One of these is the still mysterious time sense Where it resides no one knows. What bodily mechanism keeps clock on it is equally a mystery. Yet there can be no doubt that in some way the human machine keeps track of something that we call the passage of time. Just so the same machine keeps track of up or down; that is, it perceives the cosmic fact of gravity. That it perceives this fact wrongly we already know. Whether we perceive what we call the passage of time with similar errors is still an unsolved problem. What Dr. Lewis does is to point out that in the science of physics it occasionally may be convenient to assume that we know as little of true time as we do, by our senses alone, of true gravity; that past and future may be regarded as human artifacts just as up and down are meaningless to the astronomer.'

#### BIRTH CONTROL AND THE CHURCHES

There is much discussion over the revision of the State Laws so that physicians may legally give contraceptive advice to women suffering from disease such as tuberculosis, but much opposition has come from church people. The New York Herald Tribune of April 9 commenting on the action taken by the Methodist Church says:

"The world does move, and one of the subjects upon which it moves is that of birth control. The action of the New York East Conference of the Methodist Episcopal Church, taken on Monday, April 7, declaring birth control 'in the interest of morality and sound scientific knowledge' and calling upon the Legislatures of New York State and of Connecticut to remove the existing legal restrictions upon knowledge of birth control is a straw in the wind.

"This action by the Methodists of New York follows, significantly enough, upon similar action taken last year by the Commission on Social Justice of the Central Conference of American Rabbis, the Conference of Congregational Churches of Connecticut and the Universalist General Convention. As little as five years ago such an action by any one of these bodies would have seemed impossible; today it is certainly the forerunner of like action by many other religious bodies. The Protestant churches of America are awakening to the fact that birth control is here, that the only question which the community as a whole can judge and its legislators determine is whether it shall continue clandestine and sporadic, practiced most by those who need it least, and denied to those on the poverty fringe, to whom each new baby is a calamity.'

# BOOK REVIEWS

CLINICAL LABORATORY METHODS. By RUSSELL LANDRAM HADEN, M.A., M.D. Third Edition. Octavo of 317 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$5.00.

The third Edition of "Clinical Laboratory Methods"

by Russell L. Haden scarcely needs any introduction to the medical public. It is a manual which is intended to outline for the laboratory worker, those methods which are essentially applied in the actual practice of medicine. The volume maintains the general excellence in arrangment, clarity and brevity that has prevailed in the preceding editions. The directions for the prepara-tion of the reagents, the performance of the tests and the recognition of the results are described in a manner that leaves no room for question or doubt. The illustrations are sufficient and amplify the explanations in a very commendable manner. This edition contains a number of additions amongst which are emphasized, the description of the determination of indican in blood and the Kahn precipitation reaction for syphilis. The volume, it is true, is small, but it is one that can be recommended unreservedly to the laboratory technician as a ready reference book which will supply any needed information at a moment's notice.

DR. MAX LEDERER.

GENERAL PARALYSIS AND ITS TREATMENT BY INDUCED MALARIA. Report by Surgeon Rear-Admiral E. T. MEAGHER, R.N. London, His Majesty's Stationery Office, 1929. 88 pages. 8vo. Paper, 2's Net. (Board of Control, England and Wales.)

It is an unusually exhaustive and detailed report of the results of five years (July 1922—July 1927) treat-ment with malarial inoculation of patients suffering from general paralysis of the insane in England and Wales. One is impressed with the huge labor involved and the extreme care taken in collecting and sifting the data for this statistical report.

In the preface, Sir Hubert Bond presents an interesting and very instructive treatise of twenty-nine pages on "General Paralysis Historically Considered."

Admiral Meagher has reviewed the extent and value of malarial therapy on the continent by his gleanings

from actual visits to six countries.

If clouds of doubt exist in the minds of some as to the efficacy of malarial therapy in the treatment of general paralysis, they certainly should be dispelled by a perusal of this very honest survey. This pamphlet is highly recommended and is well worth the reading of every physician, each of whom may possibly agree with the author that "in applying malaria to general parlying Western Ferrage by parlaysis, Wagner-Jauregg has found a key which moves the lock."

HAROLD R. MERWARTH.

MATERIA MEDICA AND THERAPEUTICS INCLUDING PHAR-MACY AND PHARMACOLOGY. By REYNOLD WEBB WIL-cox, M.A., M.D. Twelfth Edition. Octavo of 690 pages. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$5.00.

In its twelfth edition, this book is up to its usual high

standards, ranking as one of the foremost of its kind on the subject. It is complete in detail description of the properties, action and uses of drugs and their preparations. The present revision includes a rewriting of the section devoted to Pharmacy and Materia Medica so as to conform with the requirements of the United States Pharmacopoeia X. It is valuable to both student and practitioner and should be in every library.

Some Principles of Minor Surgery. By ZACHARY COPE. Octavo of 159 pages, illustrated. London and New York, Oxford University Press, 1929. Cloth, (Oxford Medical Publications.)

In this little volume the use and abuse of antiseptics is extensively covered. Eighteen pages devoted to this subject is, we think, somewhat out of proportion. The use of vaccines and sera are recommended in infections. The efficacy of this treatment is doubted by many in this country, while in France surgeons have entirely abandoned its use. The chapter on common mistakes in diagnosis and treatment of acute abscess is valuable as is also that chapter on the diagnosis and treatment of common sprains. The subjects in this small book are well covered in the standard text books, which the author acknowledges in his preface.

W. GORDON FLICKINGER.

THE ROAD TO HEALTH. The Jayne Foundation Lectures for 1929. By C. E. A. Winslow, Dr. P.H. 12mo of 151 pages. New York, The Macmillian Company, 1929. Cloth, \$2.00.

Dr. Winslow has here depicted in story form how the various agencies, individuals and factors have contributed to eliminate that most elusive thing, disease, and also how the human body may be kept at a level to successfully combat disease.

The writing is clear and concise, yet each procedure that has been advanced even from the earliest times is subtly woven into a story of progress toward real health.

THE HISTORY OF NURSING. By JAMES J. WALSH, M.D., Ph.D. 12mo of 293 pages. New York, P. J. Kenedy & Sons, 1929. Cloth, \$2.00.

In these days of greater security in the nursing pro-fession, with a grading committee in New York State for measuring the worth of the various schools of nursing, and a National Organization for Public Health Nursing, which sets standards for the entire country, it is with great interest we read James J. Walsh's book, "The History of Nursing," in which is described the progress in the nursing field during a period of several centuries.

The introductory chapter deals with some of the historical facts concerning nursing which have come down to us from the ancient Egyptians, Grecian and other

earlier civilizations.

The chapters on "Nursing in America, the Spanish phase and the French phase" are especially interesting. Dr. Walsh writes with the greatest sympathy and appreciation of the work of Catherine of Siena and Flor-ence Nightingale to whom the nursing of today owes so

In his zealous presentation of the history of nursing through these eras he gives little space to the development of public health nursing up to the present time. His emphasis is preeminently upon the nursing of the religious orders rather than upon secular nursing in its most modern phases.

Apart from this Dr. Walsh has prepared a volume of history which is a delight to read. He seems to have the power of selecting only that material which brings

out the very finest qualities in the nursing profession.

This book should not only be read by nurses but would prove most instructive and entertaining for those who read for diversion.

F.S.

Some Methods for the Prevention of Tuberculosis. By W. Belton Tomson, M.D. Octavo of 148 pages New York, William Wood & Company, 1929. Cloth, \$2,50.

Doctor Tomson advances the proposition that the methods in present use dealing with the tuberculosis problem have not secured the results anticipated in the eradication of the disease. Further, that "in the vast majority of cases the disease is contracted in childhood from personal contact with an infecting agent" and that "it is possible by prompt action not only to save the child from infection but to succeed in de-tubercular-

The author has well summarized in this book the measures taken in many countries to remove the infant at the earliest moment from the parent or home when tuberculosis is present-even directly after birth-and to place it with a selected family in the country district. for place It with a Serected and I was a serviced for France, Belgium, Switzerland, Norway and America, with its preventoria, attempt this work with varying methods. All these methods, with their special difficuties, especially the financial ones, and the results are carefully considered. So, too, is the housing situation especially in England, with the conditions of home life and income of tuberculous people, considered, and the experiment of Papworth town consisting of sanitarium, hospital and colony.

The author is convinced that the good results of these experiments is limited almost solely by insufficient finan-cial support. The successful results of the child place-ment system has brought from Calmette, "Amongst all the institutions for combating tuberculosis-there is not one which corresponds more exactly to our actual con-

ception of scientific prophylaxis."

T. A. McG.

An Introduction to Pharmacology and Therapeutics. By J. A. Gunn, M.D., D.Sc. 16mo of 220 pages. London and New York, Oxford University Press, 1929.

Cloth, \$4.75.

Condensation is always a risky undertaking; and, probably more so, when considering pharmacology than any other subject. But Dr. Gunn has done a masterly job, as he has produced the most accurate, brief survey that has appeared in this country. To condense so large a subject into two hundred pages and preserve scientific accuracy to the degree that characterizes this book, can only be done by a teacher long experienced in the field.

Here is a small volume that encompasses this large subject to a remarkable degree and can be profitably possessed by those desiring to post themselves in this usually voluble subject. In addition, the author's style provides a most readable and entertaining presentation.

M. F. DEL.

A Textbook of Materia Medica for Nurses. By Edith P. Brodie, A.B., R.N. Third Edition. 12mo of 283 pages. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$2.00.

To write a Materia Medica for nurses is a difficult problem. Few authors realize the nurse's limitations and seldom appreciate the extent of their training in the fundamentals of the medical sciences. This book was written by one who knows what should be taught so a student nurse can grasp the subject, F. S.

AIDS TO PHARMACEUTICAL LATIN, By G. E. TREASE, Ph.C. 16mo of 168 pages. New York, William Wood & Company, 1929. Cloth, \$1.50.

This is a concise and well written little book dealing with Pharmaceutical Latin, especially prepared for the use of medical and pharmaceutical students.

In addition to the grammar there are valuable suggestions relating to the correct construction of a prescription and a Latin-English vocabulary.

DISEASES OF THE CHEST AND THE PRINCIPLES OF PHYSICAL DIAGNOSIS. By GEORGE WILLIAM NORRIS, A.B., M.D., and HENRY R. M. LANDIS, A.B., M.D. Fourth Edition. Octavo of 954 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1929. Cloth, \$10.00. \$10.00.

In this edition new material has been added and the whole book revised. The volume is meant for the clinician and clinical methods are emphasized. The importance of a thorough physical examination made before the laboratory reports are considered is stressed. There are many photographs of frozen sections from the cadaver, previously hardened in formalin and numerous other illustrations.

A chapter by C. M. Montgomery deals with the transmission of sounds through the chest, L H. Clerf has written a section on diagnostic bronchoscopy and E. B. Krumbhaar a chapter on the electrocardiograph.

The authors are experienced teachers and the previous editions have established the work as a standard one,

WM. E. McCollon.

INTERNS HANDBOOK. A Guide to Rational Drug Therapy, Clinical Procedures and Diets. By Members of the Faculty of the College of Medicine, Syracuse University, Under the direction of M. S. Dooley, A.B., M.D. 16mo of 254 pages. Philadelphia and London, J. B. Lippincott Company, 1929. Cloth, \$3.00.

This small volume is intended as a ready reference book for interns and gives the information needed in using standard drugs. An outline of the emergency treatment of drug poisoning is also given in Part One. Part Two includes various clinical procedures used in medi-

cine, surgery and the specialties and types of diet. It furnishes practical information in a convenient form and will be of assistance to interns in adapting them-

selves to hospital routine. W. E. McCollom.

THE AFTER-TREATMENT OF OPERATIONS. A Manual for Practitioners and House Surgeons. By P. Lockhart-Mummer, F.R.C.S. Eng. Fifth Edition. 12mo of 281 pages. New York, William Wood & Company, 1200 pages. 281 pages. New Y 1929. Cloth, \$3.25.

This small volume cannot be praised too highly. At a time when operating seems to be within the province of every licensed physician, the need of just such a book

is very pressing,

The author gives a most lucid picture of post-operative treatment to which all surgeons of experience will subscribe. Every possible complication is considered and the rationale of each advised therapeutic or prophylactic measure is clearly stated.

The volume should be placed into the hands of every

hospital intern and beginning surgeon.

A Graphic Guide to Elementary Surgery. By Prof. Dr. Th. Naegell. Translated by J. Snowman, M.D. Octavo of 206 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$5.00.

This small volume graphically illustrates the more important details of elementary surgery, and presents to the beginning student of surgery many problems in a manner that is easily understood and should be easily

retained in the mind of the student.

The text of this book is meagre but is sufficient to describe the illustrations. The book is divided into thirteen chapters which describe in an elementary way anaesthesia, infections, wounds, hemorrhage, thermal injuries, tumours, surgical treatment by operation, grafting and methods of examination. There are 322 illustrations, most of which are in color. The book in its entirety contains about 200 pages and should be an excellent aid to those who leach after the methods HERBERT T. WIKLE. described.

### NEIGHBORS OUR

#### MEDICAL CONFERENCE THE TRI-STATE

The Tri-State Medical Conference is the subject of the following Editorial in the Pennsylvania Medical Journal:

"In this number of the Journal appears the report of the Tri-State Medical Conference held in New York City, February, 8. The program was devoted to the discussion of a very valuable subject to the medical profession, viz., 'How Can the Medical Profession, Through Its Units, Most Effectively Cooperate in Promoting the Modern Lay Public Health Program.' We would urge our members to read carefully this report which continues to remind the physician that preventive medicine is slowly but surely replacing curative medicine and that the physician must fit in the general scheme.

"As stressed by one of the speakers, Dr. Walter F. Donaldson, the agencies that are interested in the public health program should bear in mind that persons who are able to pay for vaccination, diphtheria immunization, and similar procedures should be referred to a physician, and not given free attention. There is too much of the latter being done, through carelessness and thoughtlessness on the part of overzealous health workers.

"On the other hand, the medical profession should be keenly alert to modern methods, and he prepared to render service when persons apply, who are able and willing to pay. In many instances physicians in a community have been non-cooperative, even when the applicants were able to pay, and under these circumstances health workers have recommended and even taken the persons where such service would be rendered

free of charge.

"We have urged on numerous occasions the necessity for the various county medical societies to realize the need for their initiation of a program of lay education and to control or guide all public health matters in their respective counties. We can do no more. Many of the medical societies of our State are content to allow their community to be instructed as well as possible by our State Department of Health. But, the secretary of our State Department of Health, Dr. Theodore B. Appel, states: 'The county medical society should regain the position it once occupied, to provide health data and advice in all local situations.' This sage admonition from our State secretary of health should arouse the county medical society from its lethargy."

The Journal prints this stenographic report of the conference covering thirteen pages of small

type.

### ENFORCEMENT OF MEDICAL LAWS IN PENNSYLVANIA

The April number of the Pennsylvania Medical Journal has the following editorial on the enforcement of the medical laws of the State:

"The Board of Medical Education and Licensure feels that the physicians in Pennsylvania might be interested in a report of the work done in recent years in enforcement of the Medical Practice Act in this State, by the Board and its

investigators.

"In June, 1929, an injunction was asked for in the Courts of Allegheny County, by the Chiropractor Association of the State to restrain the Board from making prosecutions against unlicensed chiropractors, the claim being made that they have a property right in their practice. The case was argued in October, and a decision has not yet been handed down (January 21, 1930). This action has impeded prosecution in as much as the legal authorities throughout the State are induced by defendants to await the decision of the Alleghany County Court before prosecutions are made. This has been especially so in the western and central counties.

"Since writing this report, the Court of Common Pleas of Allegheny County, has denied the injunction asked by the Chiropractor Association. This will very likely act as a boomerang to the chiropractors in future prosecutions, because in the decision of the Court, the position of the Pennsylvania Board of Medical Education and Licensure is legally upheld in its right to formulate regulations for licensure of limited practitioners, and definitely upheld the former decision of various courts that the practice of chiropractic is the practice of medicine.

"Lack of cooperation in the district attorney's office has interfered with successful prosecution in some counties; and lack of cooperation by some County Medical Societies, has also increased

the difficulties.

"At present a chiropractor is being held by court in Braddock County; in Westmoreland County, four continued cases are awaiting trial; in Beaver County, a neuropath is a defendent; in McKean County, a domineering chairman of

Ti we're and a Wilks

#### as Cow's Milk

When physicians are confronted with undependable fresh milk supplies in feeding infants, it is well to consider the use of reliable powdered whole milks such as Mead's or the well-known Klim brand. Such milk is safe, of standard composition, and is easily reliquefied.

Under these conditions, Dextri-Maltose is the physician's carbohydrate of choice just as it is when fresh cow's milk is employed.

The best method to follow is first to restore the powdered milk in the proportion of one ounce of milk to seven ounces of water, and then to proceed building up the formula as usual.

In Rickets, Tetany and Osteomalacia

The clinical experience which safely settled the question of activated ergosterol dosage was obtained under fellowships established by Mead Johnson & Co., at five leading universities. This rich experience is behind every bottle of Mead's Viosterol in Oil, 100 D (originally Acterol)—the American Pioneer—Council-accepted.

Specify the American Pioneer Product— MEAD'S Viosterol in Oil, 100 D— Mead Johnson & Co., Evansville, Indiana

## The PHYSICIAN'S POLICY is MEAD'S POLICY

Besides producing dependable Infant Diet Materials such as Dextri-Maltose, and maintaining a model laboratory devoted exclusively to research, Mead Johnson & Company for years have been rendering physicians distinguished service by rigidly adhering to their well-known policy, namely:

"Mead's Infant Diet Materials are advertised only to physicians No feeding directions accompany trade packages. Information in regard to feeding is supplied to the mother by written instructions from her doctor who changes the feedings from time to time to meet the nutritional requirements of the growing infant. Literature is furnished only to physicians."

Every physician would do well to bear in mind that in this commercial age, here is one firm that instead of exploiting the medical profession, lends its powerful influence to promote the best interests of the medical profession it so ably serves.

"1. Consult school authorities to gain con-

sent and cooperation.

"2. Give advance publicity through the local newspapers, and present the plan at your regular meeting of the parent-teacher association.

"3. Register with state chairman, name and

address below.

"4. Make a canvass to locate the children to be examined, using (a) house to house canvass; (b) kindergarten rolls; (c) cradle rolls; (d) names turned in by the school children.

"5. Hold a 'Round-Up' of the mothers of children to be examined, having talks made by a physician, a nurse and the campaign director, giving the mothers an opportunity to ask questions.

"6. Determine method of examination, whether it is to be in the family physician's

office or in a clinic at the school.

"A. If examinations are to be in physicians'

offices the local committee should:

"(a) Make arrangements with physician for hours, and provide nursing and clerical assistance, if necessary.

"(b) Make whatever arrangements are necessary with the mother for having the child there

at time specified.

"B. If examinations are to be in a clinic at school or elsewhere, the committee should:

"(a) Secure assistance of physician, dentist, nurse, and parent-teacher members and mothers of the children.

"(b) Provide equipment after consulting

with the physician in charge.

"Tables, wash basins, paper napkins, medicated cotton, pen and ink, scales, water, tongue depressors, towels, antiseptic solution, tapeline, paper towels, applicators, chairs.

"1. Arrange for physical examination, in room provided, with a parent-teacher member in charge, where the children can be undressed to the waist and a towel put around the child.

"2. Physician and dentist examine child; nurse or parent-teacher member registers, weighs and measures the child, and fills in the National Record Blank supplied free of charge to Illinois Congress associations who have enrolled for Summer Round-Up.

"3. Follow up the examination by visiting the parents of registered children in a friendly way to make sure that remedial work is being done.

"The examination blanks which will be used for the Summer Round-Up are furnished by the American Medical Association."

The chairman of the Educational Committee of the State Society sent the following letter to the President and Secretary of every County Society:

(Continued on page 560-adv. xxii)

## HAY FEVER

## An Advertising Statement

HAY FEVER, as it occurs throughout the United States, is actually perennial rather than seasonal, in character.

Because in the Southwest—Bermuda grass, for instance, continues to flower until December when the mountain cedar, of many victims, starts to shed its pollen in Northern Texas and so continues into February. At that time, elsewhere in the South, the oak, birch, pecan, hickory and other trees begin to contribute their respective quotas of atmospheric pollen.

But, nevertheless, hay fever in the Northern States at least, is in fact seasonal in character and of three types, viz.:

TREE HAY FEVER—March, April and May GRASS HAY FEVER—May, June and July WEED HAY FEVER — August to Frost

And this last, the late summer type, is usually the most serious and difficult to treat as partly due to the greater diversity of late summer pollens as regionally dispersed.

With the above before us, as to the several types of regional and seasonal hay fever, it is important to emphasize that Arlco-Pollen Extracts for diagnosise and treatment cover adequately and accurately all sections and all seasons—North, East, South and West.

FOR DIAGNOSIS each pollen is supplied in individual extract only.

FOR TREATMENT each pollen is supplied in individual treatment set.

ALSO FOR TREATMENT we have a few logically conceived and scientifically justified mixtures of biologically related and simultaneously pollinating plants. Hence, in these mixtures the several pollens are mutually helpful in building the desired group tolerance.

(Continued from page 558-udv. xx)

"Dear Doctor:

"Our Educational Committee wishes to keep County Medical Societies informed of activities sponsored by lay groups with whom we are in direct contact. As you know, one of the major projects of the Illinois Congress of Parents and Teachers in the Summer Round-Up of Pre-School Children. The purpose of this movement is to attempt to correct remedial physical defects in children of pre-school age, so that they may enter upon the school period free from unnecessary physical handicaps.

"This Parent Teacher Association movement is of great concern to the medical profession of Illinois, and the Illinois Congress of Parents and Teachers now realize that their work cannot succeed without the support of physicians.

"Those responsible for the general plans of the Summer Round-Up have emphasized the importance of their local associations conducting these campaigns in cooperation with the local medical societies. They suggest that ex aminations be given by the family physician in his office or in clinics—the method rests entirely with the local County Medical Society. Compensation is between patient and physician.

"There is need for better cooperation and understanding between the local Parent Teacher Associations and the local medical groups. We therefore, hope that your Society will cooperate with representatives of your Parent Teacher Association in making plans for satisfactory methods and arrangements for the Summer Round-Up. We recommend that you be cordial but firm in holding your local Associations to the plan of the State Congress, which does recognize a family physician responsibility."

### SCHOOL CHILDREN'S HEALTH SUPERVISION

The April issue of the Journal of the Medical Society of New Jersey has an extensive list of reasons that the supervision of the health of school children should be under the State Department of Public Instruction rather than the Health Department. The argument was written by Allen G. Ireland, M.D., Director of Physical and Health Education of the New Jersey State Department of Public Instruction:

"(1) Because the school has jurisdiction over

the child while at school.

"(2) Because of the close relationship bc-

tween the school and the home.

"(3) Because outside of citics the Board of Health is usually composed of laymen, while there is always a trained person at the head of

(Continued on page 561-adv. xxiii)

(Continued from page 560-adv 1x11)

the school system. The efficiency of any system of health education is determined largely by the efficiency of its administration. There should be no confusion or dual responsibility in matters pertaining to it Divided responsibility of administration frequently leads to confusion, invites misunderstandings, and materially lessens efficiency.

"(4) Because it is a function of the school to teach health, and health work should be a unit instead of being divided into sections: (a) Fundamentally and logically an educational problem of training teachers and pupils in applied hygiene and in practical sanitation. (b) Board of Health is not in a position to make adjustments of educational processes necessary to meet the health needs of the child (c) The task of the school is to so direct the educational processes that the child's native heritage of vigor and health may be fully attained and his hereditary deficiencies corrected This is an educational problem; also an administration problem of the school. (d) It is a part of the process of education aiming toward the physical, mental, and moral development of normal,

struction in hygiene, guiding of correct health habits, detection and correction of physical defects, control of communicable disease, and school sanitation, are closely related and should be articulated in a comprehensive program of activity

boys and girls who will become physically effi-

(e) The in-

cient members of adult society

"(5) Because the machinery of education is established and in operation and furnishing the logical avenue of approach to the child: (a) It involves school policy, school organization, and school administration. It is but an integral part of any modern educational system in which many activities must of necessity unite in its proper organization and efficient administration. 'Every unit of administration must articulate with every other educational unit in the completed program. It must of necessity be administered as a part of and not as apart from the educational system in which it operates. (b) The work of doctors and nurses resembles the work of teachers rather than that of inspectors. Any health program which involves teacher, nurse and doctor must show unity of thought and action. (c) It is a program of keeping well and not one of getting well. It deals with mental or physical health or growth rather than with disease.

(6) Because there is more friendly cooperation if doctors and nurses are part of the school system: (a) Members involved will better cooperate by reason of one source of authority. (b) When administered by outside authorities

the interest of the teacher is not so easily en-

"(7) Because of the close relation of physical health to educational efficiency. Good health is a means to an end and not an end in itself. This has immediate application to the schools in that we need to build for increased capability in school work as well as for the future. We can influence but not control activities away from the school. The formative work must be done while the pupils are under public control."

#### A CANCER CURE

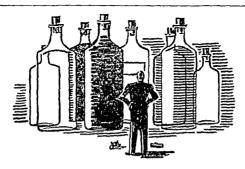

Physicians in New York State will find material for an effective cancer talk in the story of the exploitation of an alleged cancer cure as told in the Journal of the State Societies of Oregon, Washington and Idaho, which says:

"The latest discovery by Coffey and Humber of San Francisco has thus far followed true to form in the steps of its predecessors. Cautiously announced some months ago in the daily press, certain physicians hastened to the source of information in order to get in on the ground floor in the administration of the latest cancer remedy. When it was formally pre-

sented before the recent meeting of the Pacific Coast Surgical Association, reporters of the Hearst press were let in on the good news who duly proclaimed a scoop on their newspaper brethren. At once the lid was off. The newspapers of this group devoted whole pages to exploiting the great discovery with all its details, including photographs of its sponsors in action. The traditional reticence of medical scientific investigators was repudiated and, demonstrating their truly benevolent interest in suffering mankind, these papers declared that the army of cancer sufferers was entitled to information concerning this treatment, and post haste they were going to get it, willy nilly, so far as the medical profession was concerned. Confirmation of belief in the new discovery was not wanting.

"It is not intended to intimate that this latest 'cure' is necessarily a delusion or a bald assumption. From investigations suggested along this line of treatment, may result something that will help to discover the cause of cancer. Yet the noisy publicity which has accompanied the launching of this treatment is one of the most regrettable in the recent history of medicine. The many exploitations of victims of incurable cancer in the past have served to discredit scientific efforts for the solution of the

cancer problem."

# Parading the Pets

CONSTIPATION is such a universal condition that nearly every physician has a pet treatment for it—and swears by it because it works.

No one can find fault with that. After all, results count. To those physicians who have not yet adopted a favorite method, or whose pet formula has outlived its youthful activity Agarol the original mineral oil and agar-agar emulsion with phenolphthalein, makes its appeal. Those who adopt Agarol as a routine therapeutic measure, with diet, exercise and habit formation as companions, will never be disappointed.

Agarol softens the intestinal contents and makes their passage easy and painless. By gentle stimulation of peristalsis, Agarol makes the result certain and reeducation of the natural bowel function possible.

One tablespoonful at bedtime
- is the dose

Final decision on the true worth of Agarol rests with the physician. We will gladly send a twin package withliterature, for trial,

AGAROL for Constipation

#### THE STATE JOURNAL OF VIRGINIA

The opinion of President Charles R. Grandy regarding the aims of the Virginia Medical Monthly coincide with that of the Publication Committee of the New York State Journal of Medicine. The President's Page of the April

issue of the Virginia Journal says:

"The Virginia Medical Monthly belongs to the Medical Profession of Virginia. It is not only run in order to furnish help to the Medical Society of Virginia, but to aid the local societies and each individual member of the state society. We especially desire the secretaries of the local societies to feel that it is their journal and to send the Secretary of the Medical Society of Virginia all news items and all programs which would be of interest to the profession of the state, as a state medical journal should not only contain scientific papers but should also be a professional newspaper giving each of us news items about our friends in other parts of the state. We ought to have reports of what the local societies are doing, as well as suggestions in regard to improving the status of the Profession. To get this accomplished I feel that it is necessary to get the secretaries of all the medical societies in Virginia closer together, and we hope to have a Lunchcon Meeting of the secretaries at the time of the Norfolk meeting of the state society. At this meeting we should be able to formulate plans which should be of permanent service in improving the Medical Monthly, and making it the most valuable periodical that members of the Profession of Virginia receive."

New York physicians will also agree with Dr. Grandy in his statement of the friendliness of the city physicians to their rural confreres,

when he writes:

"There has been criticism made, from various sections of the state, that the Medical Society of Virginia is only run for the benefit of the city physicians, especially those living in Richmond and Norfolk. If this were ever the policy of our Medical Society, it has now been entirely reversed, and every effort is being made to extend the privileges of the city doctors to all those living in the country. It is sincerely hoped that the country doctors will take advantage of whatever privileges are offered them, for the city doctors are now extending the hand of good-fellowship to their country brethren, as well as to their brethren living in other cities. For the good of the Profession as a whole may we all cooperate in thus bringing about a feeling of true accord and harmony."

# Sugar belongs in the diet ASK YOUR DOCTOR!

SHOULD SUGAR HAVE A PLACE IN THE DIET? Here are some interesting facts -- information which your doctor would give you.

Sugar is a preferred fuel food. When eaten in any form, it combines with oxygen in the body. Seventy-five per cent of its energy goes into heat and the rest supplies power to the muscles.

Sugar makes essential foods, which are the vehicles or carriers of roughage, mineral salts and vitamins, more palatable. It modifies harshacids, heightens bland flavors

Consider how many fruits and vegetables

that you eat are sweet. How unpleasant they would be without this palatable flavor. Often, however, certain familiar vegetables lose the sweetness they possessed when fresh picked, because their sugar has been converted into starch. In such cases it is proper to add a dash of sugar in cooking them to restore their original flavor.

Think of these facts as you plan your meals. And in addition to using sugar as a flavor remember that simple wholesome desserts have their place in balanced meals. The normal diet calls for sugar. Ask your doctor! The Sugar Institute.

Good food promotes good health" - lateps at when writing to od ceivers

## PUBLIC OFFICE AND SOCIETY MEMBERSHIP IN NEW JERSEY

The Medical Society of Mercer County in which the cities of Trenton and Princeton are located, must have had an unrecorded experience of unpleasantness with some of its office holding members to induce it to pass the following resolution which is reported in the April issue of the Journal of the Medical Society of New Jersey:

"The New Jersey State Medical Society was organized as a voluntary association for mutual improvement and for promoting the welfare of the medical profession, incorporated under an Act of the State of New Jersey, for the purpose of regulating the practice of medicine and surgery in this State.

"One of the outstanding purposes of the Society is to elevate professional standards, and in general to render this profession most capable of serving humanity, safeguarding the material interests of, and promoting friendly relations among members of the medical profession.

"With this aim in view, a liberal interpretation of membership requirements and a charitable attitude toward applicants should be advocated, however, bearing in mind that improper conduct carries with it the stigma of disrepute.

"In the Principles of Medical Ethics of the A. M. A. will be found the statement: 'The practice of Medicine is a profession. In choosing this profession an individual assumes an obligation to conduct himself in accord with its ideals.'

"The selection, appointment, or election of a member of the medical profession to an official position of supervision, under county, municipal, or State government, the salary, maintenance and other prerequisites being fixed by law, is attended by certain fundamental requirements.

"The encumbent of such an office should bear in mind his duty and obligation to the welfare of that position, as being paramount to every other issue, and; secondly, his obedience to ethical conduct in his professional practice toward his follow practitioners.

"Therefore, be it moved: That on and after December 1, 1930, any member of the Mercer County Component Medical Society who holds a full time State, Municipal, or County position, with full or partial maintenance, or any member who holds a part time State, Municipal, or County position, with full maintenance, and at the same time is engaged in the private practice of medicine and survey shall be no longer considered a member of the society."

A well known Urological Tournal says:

"If you must use a diuretic, try the best -water"

This recommendation is well worthy of adoption especially

# Coland ' lilater

is used. ¶ Physicians have commented favorably on its bland diuretic properties for over 60 years.

#### GRAPE JUICE

The Dewey Company at its plant in Egg Harbor City, New Jersey, makes a cool process grape juice from grapes grown on the rich soil of southern Jersey.

The same Grape Juice is combined by the Dewey Company with Minerals Oil and Agar-Agar (known as Grape Minol). Although it is a recent combination it is stocked by all of the New York jobbers, and can be secured by the physician from his druggist. The Dewey Company will gladly send samples of either Grape Juice or

Grape Minol to the physician upon request. See page 7—Adv.

#### A CALCIUM PREPARATION THAT CHILDREN LOVE

There are two drawbacks to most calcium preparations for oral usethe taste is horrible and assimilation is uncertain. In Olajen, a preparation containing salts of calcium, sodium, potassium, iron and lecithin, the first of these objections has really been overcome. Olajen actually l

tastes like a creamy fudge. It is claimed for this preparation on the basis of clinical records that absorption is exceptionally good because of its colloidal nature. For samples and literature write Olajen, Inc., 451 West 30th Street, New York City. See page xxiii.—Adv.

#### HARMINE MERCK

Its influence on the rigor and the hypokinetic sequelae of encephalitis lethargica.

Pharmacologic investigation of the alkaloid Harmine has shown it to possess motor stimulation of the central nervous system, with a notable influence on the extrapyramidal nervous system. Researches undertaken with a view to the treatment of certain sequelae of encephalitis lethargica indicate favorable influence on the muscle rigor and the hypokinesis of the Parkinson syndrome. The rigor decreases while the gait becomes freer.

The most recent report on the subject is that by Beringer and Wilmanns (Deutsche, med. Wchnschr. 55:2081, Dec. 13, 1929). They state that the voluntary movements are most influenced, but that there also appears to be a gradual improvement in the involuntary movements. The authors noted that in some cases in which Harmine had been given over a more extended period the movements of expression (Mimik) became more fluent. This would indicate a progressive cumulative influence of the drug. The influence of a single dose of Harmine is apparently of but short duration but has been reported to persist in some cases for a period of a few hours to a half day.

The subcutaneous injection of Harmine is the most effective method of administration. Keratin coated capsules may be prescribed orally for home use but will exert a weaker effect. The most efficient subcutaneous dose lies between 0.02 and 0.04 grams which may be given twice daily. Harmine should not be given intravenously. The alkaloid is supplied by Merck in cartons of five 0.02 Gm. and 0.04 Gm. ampuls and in tubes of twenty 0.02 Gm. keratin coated capsules. See page xxvi-Adv.

#### BELLADENAL "SANDOZ"

Belladenal is an association of Bellafoline, a reliable antispasmodic, with phenobarbital, a dependable sedative. Belladenal is efficient in the treat-

ment of obstinate spastic conditions. It is especially valuable in refractory cases of epilepsy, in Parkinsonism, migraine and chorea. It exerts a marked analgesic effect in angina pectoris, cardiac and gastric neuroses, dysmenorrhea and climacteric disturbances.

With Belladenal unpleasant by-effects, dizziness, drowsiness and mental depression are minimized. It acts promptly and is well adapted for long

continued treatment because of its freedom from untoward action on the circulatory and respiratory systems.

Doses: Adults, 2 to 4 tablets, maximum 6 per day; children in proportion. The cruciform indentations on the tablets permit fractional doses. Marketed in tubes of 20 and bottles of 100 tablets by Sandoz Chemical Works, Inc., New York, N. Y. See page xv -Adv.

#### THE PROGRESS OF MEDICINE

In Rijks Museum in Amsterdam, Holland, a painting by Van Mieris de-picts the apothecary of old holding the suspended scales with the left hand while he adds a medicinal substance to the pans with his right. Gallipots, flasks, dried drugs, bulbs, and berries comprise his stock and equipment. In such shops as this were established the foundation for many of the achievements of modern medicine.

The apothecary of that time would have scorned the prediction that the twentieth century would bring to medicine the accomplishments that have been credited to research and science.

Chinese medicine employed MaHuang fifty centuries ago. The refinements in this useful drug are exemplified in Lilly Ephedrine Products, one to meet each of the varied requirements of physicians: Inhalants, Solution, Ampoules, Pulvules, Jelly, Syrup, etc.
Something of the virtues of gland

products must have been known to the ancients but nothing comparable to the rewards that have followed the researches of our time, notable among which are Liver Extract No. 343 and

Iletin (Insulin, Lilly).

The germ theory of disease is comparatively young but great progress followed the acceptance as is evidenced in the latest addition to the list of germ-

icides; namely, Merthiolate, Lilly.
The list could be extended at length with products such as Amytal, Amytal Compound, Typhoid Mixed Vaccine, Tetanus Antitoxin, Para-thor-mone and others, proving that the refinement and development of medicinals has kept pace with progress in other lines. See page xvi-Adv.

### DOCTOR, WHO ARE YOUR "COMMERCIAL" FRIENDS?

Now when the physician is beset on all sides to try products "just as good as Meads," it is well for the physician to consider that in a commercial age when the practitioner must compete with newspaper, magazine, radio, tradesman and patent food manufacturers who practice medicine without a license, here is one manufacturer who unceasingly works for the medical doctor's economic as well as professional interests. Hold fast to that which is good, -the Mead Policy which makes Mead Johnson & Company more than a commercial house,-a powerful ally that practices as well as preaches ethics. See page xvii-Adv.

## VENTRICULIN ...

# Pernicious

Anemia

A PRINCIPLE FROM STOMACH TISSUE THAT STIMULATES HEMATOPOIESIS

· VENTRICULIN is palatable; it is to be taken with the meals-has an agreeable meaty flavor and is well tolerated on long continued use. Very efficient and at the same time economical.

Each lot is clinically tested in pernicious anemia cases.

An organization devoted to the study of pernicious anemia, the Thomas Henry Simpson Memorial Institute for Medical Research, University of Michigan, receives samples of each lot of Ventriculin for clinical testing. No lot is released by us for general use until it has been definitely certified as efficient in actual cases of pernicious anemia.

> HOW SUPPLIED: Ventriculin is supplied in 10-gram vials only, 12 and 25 in a package.

PARKE, DAVIS & COMPANY, Detroit, Michigan

# RADON

Gold Radon Implants for Interstitial Use.

Description: --- Pure Gold (24 Karat)

Wall thickness 0.3 millimeter Outside diameter 0.75 millimeter Length 5 millimeters

Mechanically sealed

Radon content certified and guaranteed.

Suitable Radon Implanters loaned for each case.

All orders and inquiries given prompt attention.

(Booklet furnished on request)

### THIRD GRADUATE FORTNIGHT

October 20 to 31, 1930

### "Medical and Surgical Aspects of Acute Bacterial Infections"

The third annual Graduate Fortnight of The New York Academy of Medicine will be held from October 20 to 31, 1930. The general subject which has been chosen for this year is "Medical and Surgical Aspects of Acute, Bacterial Infections."

The program as arranged is in two parts,—coordinated afternoon clinics to be held in ten important hospitals of the city, and evening meetings to be held at the Academy. An added feature of this year's Fortnight will be an exhibit of anatomical, bacteriological and pathological specimens and research material bearing upon the various aspects of the subject.

Each of the hospitals cooperating in the Fortnight will present two afternoon clinical programs dealing with different phases of the general subject.

The program for the evening meetings to be held at the Academy includes discussions of:

Focal infections as a cause of disease. Osteomyelitis and acute joint infections. Acute infections of the genito-urinary tract. Infections arising from tonsils and sinuses. Infections of the middle ear. Acute infections of the face and oral cavity. Operative risks from infection.

Appendicitis.

Bacteriemia.

Suppuration of lung and pleura. Acute infections of the gall-bladder and biliary tract.

Infections of the skin and subcutaneous tissue.

Acute infections of the upper respiratory tract including influenza.

The pneumonias and other pneumococcus infections.

Bacteriophage as a treatment in medical and surgical acute bacterial infections.

Puerperal sepsis.

Immunity—general and local.

Serum therapy.

Vaccine and non-specific protein therapy.

Rheumatic fever.

Acute and sub-acute bacterial endocarditis. Meningococcus infections including meningitis.

The list of speakers who have been invited to take part in the Fortnight includes prominent clinicians from many parts of the country who are recognized authorities in their special lines of work.

The profession generally is invited to attend.

No fees will be charged for attendance at any of the clinics or meetings on the program.

A complete program and registration blank for special clinics and demonstrations will be mailed on request.

# Intensifying the Action of Physiotherapy

In the treatment of
SINUSITIS
ERYSIPELAS,
BRONCHITIS,
OTITIS MEDIA,
CHOLECYSTITIS.

and many other conditions in which the application of heat, either of radiant energy from luminous sources, or of diathermy, is indicated, the use of an adjuvant to prolong the effect of these procedures is especially valuable.

# Antiphlogistine

is an excellent adjuvant to Physiotherapy.

It forms a warm, impermeable and protective covering over the affected part, which is particularly grateful to the patient.

More than thirty-five years of successful application have confirmed the value of Antiphlogistine in conditions where congestion and inflammation are present.

Write for sample and literature.

6 Church Street New York City

### Now! Intra-Gastric Photography—

a New Procedure in Diagnosing Stomach Disorders

INTRA-GASTRIC PHOTOGRAPHY as made possible through the Gastro-Photor, the new stomach camera, is fast gaining recognition in America. The Gastro-Photor makes possible the photographing of the gastric mucosa, including the cardia, fundus, lesser and greater curvatures, as well as the pylorus. Many of the country's

PHOTOR and transformer. A multiplestereoscopic camera for photographing the interior of the stomach.

Gomp

leading surgeons and gastro-enterologists are now using this procedure in their practice to secure intimate and detailed photographs of pathological gastric conditions.

Recognized and endorsed by many leading physicians as a valuable aid in gastric diagnosis, the Gastro-Photor has been installed in scores of hospitals as part of their diagnostic equipment.

> Complete details regarding the Gastro-Photor will be sent on request.

> > PHOTOR CORPORATION
> > 386 Fourth Avenue New York, N. Y.

Will be shown in the Technical Exhibit at the Annual Meeting of the State Society.

### Constipation in Infancy

THE fact that Mellin's Food makes the curd of milk soft and flaky when used as the modifier is a matter always to have in mind when it becomes necessary to relieve constipation in the bottle-fed baby; for tough, tenacious masses of casein resulting from the coagulation of ingested milk, not properly modified, are a frequent cause of constipation in infancy.

THE fact that Mellin's Food is free from starch and relatively low in dextrins, is another matter for early consideration in attempting to overcome constipation caused from the use of modifiers containing starch or carbohydrate compounds having a high dextrins content.

THE fact that Mellin's Food modifications have a practically unlimited range of adjustment is also worthy of attention when constipation is caused by fat intolerance, or an excess of all food elements, or a daily intake of food far below normal requirements, for all such errors of diet are easily corrected by following the system of infant feeding that employs Mellin's Food as the milk modifier.

#### Infants fed on milk properly modified with Mellin's Food are not troubled with constipation

A pamphlet entitled "Constipation in Infancy" and a liberal supply of samples of Mellin's Food will be sent to physicians upon request.

MELLIN'S FOOD COMPANY BOSTON, MASS.

# . As a routine sedative

(alphabromisovalerylurea)

Council Accepted

A quickly acting somnifacient, inducing a refreshing sleep. It is an efficient sedative in general nervous conditions. Useful as a stronger sedative than the bromides, or where a mild, yet effective hypnotic is in place.

> DOSE: As a Sedative, 5 grains (or 1 tablet) several times a day. In Sleeplessness, 10 to 20 grains.

> > Samples and literature from

We are anxious to have every physician try it. Send for complimentary bottles today.

H. T. DEWEY & SONS COMPANY

Established 1857

138 FULTON STREET

NEW YORK

The Hay Fever Season is just around the corner.

Highly satisfactory results have been reported from the treatment of hay fever by pollen extracts when properly and timely used. When results are disappointing it is often because of failure to administer the treatments sufficiently far in advance of the hay fever season.

Treatments for the desensitization of hay fever patients should commence not less than from five to six weeks before the expected onset of the attack, and unless pre-seasonal and seasonal treatments are strictly followed, the expected results will not be wholly satisfactory.

POLLEN ALLERGEN SOLUTIONS SQUIBB used for the prevention and treatment of hay fever

SQUIBB'S DIAGNOSTIC POLLEN ALLERGEN SOLUTIONS afford the means for determining the causative pollen

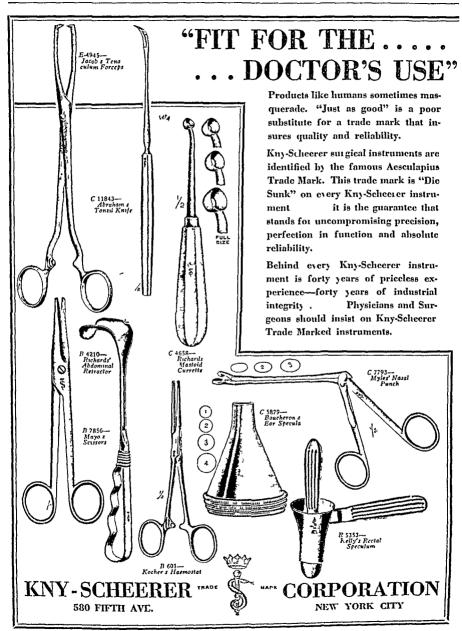

POLLEN ALLERCEN SOLUTIONS SQUIBB are supplied in Treatment Sets consisting of 10 graduated doses and ampuls of sterile salt solution for making the necessary dilutions; also in 3 vial packages containing solutions of strengths which enable the physician, without further dilution, to administer a complete course of treatment.

Special information concerning the use of Pollen Allercen Solutions Squibb for the diagnosis and treatment of hay fever will be supplied to physicians upon request.

Address the Professional Service Department.

### Anemia Successfully Treated with a

# Food-Iron Concentrate

RDINARY iron tonics and pulls are not well utilized in making hemoglobin. On the other hand, while spinach and other greens are a most wholesome source of blood iron, the difficulty is to induce delicate patients to eat enough to supply the body's needs.

The solution of the problem appears to lie in the direction of a food-iron concentrate, in which definite and increased amounts of iron are presented in soluble and assimilable form.

That is the reason for the clinical success of

#### Food-Ferrin

Food-Ferrin is a natural and physiologic source of iron. In it is found the concentrated soluble substance of a mixture of greens. It is not a medicine, but a highly efficient blood-building food

Laboratory and clinical investigation have amply confirmed its value in the treatment of anemia. It is agreeable to taste, never disturbs but aids digestion, does not injure the teeth, and never causes constipation.

So that you can make a clinical test of Food-Ferrin, we would like to send you a physicians' sample with our compliments. The coupon is for your convenience.

Mail Us This Coupon Today

#### The BATTLE CREEK FOOD COMPANY

exaggerated Trendelenburg posture, head very low after the introduction of an ordinary stomach tube. Thus with the aid of gravity, slow withdrawal of the tube results in complete removal of the gastric contents.

After the stomach is thoroughly emptied, it is inflated by means of a bulb attached to the instru-

FIGURE 2A

Dark region in center of light area is the opening of
the niche produced by the ulcer.

ment for that purpose. This inflation provides the proper medium for photography and separates the stomach walls so as to permit of the necessary focal distance for the exposure. The use of the fluoroscope in the examination is most desirable for the proper orientation of the camera within the stomach and to judge of the adequacy of the inflation. This can be accomplished very easily, the films being protected from x-ray dam-

age by a metal shutter which is displaced only at the time the photographic exposure is made.

For the past six months we have employed intra-gastric photography in seventy patients. The results of our study may be grouped as follows:—

Group I. Negative gastric photographs with negative x-ray findings.

Thirty cases fall into this group, in which the absence of any demonstrable lesion on the photographs was corroborated by the x-ray, a percentage of forty-four.

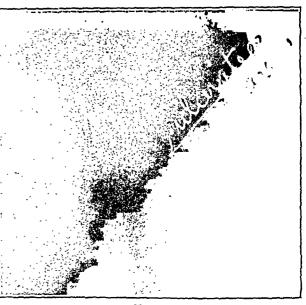

FIGURE 3
Extensive ulcer in pre-pyloric region.

Group II. Positive gastric photographs with positive x-ray findings.

In this group we find fourteen patients in whom it was possible to demonstrate definite lesions on

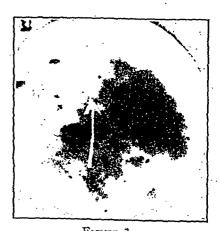

FIGURE 3A

Arrow points toward's large ulcerative area. Proved by surgery.

the gastric photographs as corroborated by positive x-ray findings. We have a percentage of twenty, making a total of sixty-four thus far in which the results of intra-gastric photography agreed with the findings by x-ray study.

Group III. Positive or suspicious gastric photographs with negative or suspicious x-ray findings.

This group is perhaps the most important of all inasmuch as, we found evidence of pathological lesions as seen on the photographs which could not be corroborated by x-ray study. We should

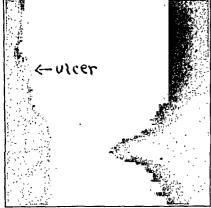

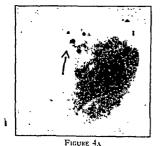

Figure 4
Defect on lesser curvature; incisura on greater curvature,
definite ulcer.

be most careful in evaluating our findings in these cases. In one of the twelve patients we had confirmation by means of surgery. In the remaining eleven we were forced to rely for our conclusions

Definite ulcer in upper middle of picture.

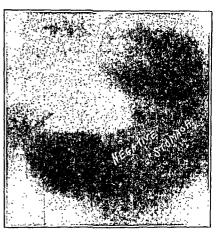

FIGURE 5
Case of carcinoma on lesser curvature.

upon our clinical impression and chemical findings. The percentage of cases in this group is seventeen.

Group IV. Negative gastric photographs with positive x-ray findings

This group likewise is an important one because

Figure 5A
Raised elevated mass quite evidently due to carcinoma, confirmed by operation

it is in these cases particularly that the possible inability of the instrument to visualize definite pathological changes, would be demonstrated. We had two cases, a percentage of three in which disagreement of findings obtained. We thus have a total percentage of twenty in group three and four in which the x-ray and the intragastric photography seemed not to agree. It is difficult to evaluate our results in these two groups, because in the one we were forced to rely on our

clinical impressions mainly, and in the other our gastric photographs were unsatisfactory for reasons which will be explained later on.

Group V. We include in this group thirteen patients, a percentage of about eighteen in which no gastric photographs were obtained. the stomach contained considerable fluid which had not been aspirated and thus damaged the films, or permitted of a liquid medium for the photography, or inflation of the stomach had not been sufficient. The causes for insufficient inflation may be continuous belching on the part of the patient, or thickening of the gastric wall due to infiltration with lack of distensibility. may fail to obtain good gastric photographs, in cases of carcinoma occasionally should the camera come in close contact with the neoplasm and not permit of the proper focal distance for the photography. This occurred in the two cases mentioned in Group IV.

#### Conclusions

Thus in sixty-four percent of our cases there was complete agreement between the gastric photographs and the x-ray findings. In seventeen percent we found apparent positive lesions on the photographs in the absence of positive x-ray findings. In view of the fact that in only one of these latter did we have confirmation by way of surgery, even though the remainder of our positive findings were corroborated by our clinical impressions, we cannot say with any degree of definiteness as yet how large a portion, if not all,

of this seventeen percent should be added to the sixty-four percent already mentioned. We are including illustrations of several typical cases in which the gastric photographs and the x-ray findings agreed and the one, confirmed by surgery, in which the gastric photographs were positive and the x-ray negative.

#### Summary

Intra-gastric photography has come as an added aid, not to supplant any of the present accepted methods of gastric diagnosis. The possibility of being able to visualize carcinoma in its early stages, flat superficial ulcerations without deformity of the stomach wall, as well as benign growths. gastritis in its various forms and the results of surgical procedures is to say the least, an intriguing prospect. Our experience has made us more than optimistic as to the future of this new method. We offer this preliminary paper as a stimulus for further work with this new instrument. In the near future we expect to report a larger series based on results obtained in still closer cooperation with the surgeon and the pathologist.

We wish to thank Dr. M. G. Wasch and the members of his x-ray staff as well as the Medical and Surgical Attendings of our Hospital for their kind and wholehearted support. Thanks are also due to the Photor Corporation for its splendid assistance and cooperation which have made this study possible.

#### THE ETIOLOGY OF HAY FEVER

Studies in Hay Fever I\*

By A. A. THOMMEN, M.D., NEW YORK, N. Y.

1. General considerations. Age: The period of greatest incidence is between the ages of twenty and forty. Its onset has been observed, however, to occur in the infant (less than 1 year of age) and in the aged (68 years of age).

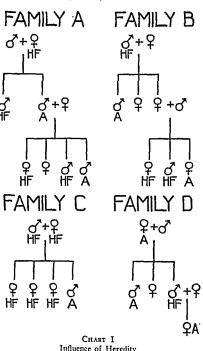

Sex: The sexes are apparently equally affected.

Occupation and Social Status: The malady is not a respecter of persons. It was incorrectly thought at one time that it did not occur in the Negro, the lowly, the uneducated or the laboring classes. These notions, together with the idea that it had a special predilection for the so-called upper classes of society were due to faulty observations and insufficient statistical data.

Race: Apparently, not all the races of mankind are susceptible to hay fever. The American Indian seems to be immune. Information concerning the occurrence of hay fever at the various Indian schools and colleges has thus far been negative in character. Statistics obtained from any similar Caucasian groups invariably contain a percentage of hay fever subjects. It is probable that other races are also immune. On the estates of the U. S. Rubber Plantations, Inc., situated in Sumatra and the Malay Peninsula about 15,000 native Malays are employed under excellent medical supervision. According to Dr. Doorenbos, the chief medical officer of the plantations, no case of hay fever has come to his notice in the course of eight years. Americans and Europeans are frequent sufferers during their visits to those tropical countries.1

Heredity: The most important known factor in the pathogenesis of hay fever and the other forms of atopic hypersensitiveness is heredity. In a group of normal individuals (representing 400 families) a positive antecedent history was obtained in only 9 per cent, whereas a positive antecedent history was obtained in 54 per cent of clinically hypersensitive persons. If the hereditary influence is bilateral (i. e. both paternal and maternal) the clinical manifestations of hypersensitiveness are most likely to occur in the offspring before the 10th year of age. (7 out of 9 cases studied-77.8 per cent). This figure may be contrasted with those obtained from a study of the unilateral and negative family history groups. . In the former (unilateral) about 35 per cent are found to develop symptoms in the first 10 years of life; whereas in the latter (negative group) only about 20 per cent are found to develop symptoms in the same period. The influence of heredity is depicted in Chart I.

II. The Exciting cause. Pollen is the exciting cause of hay fever. Pollen is the fine, dust-like powdery (occasionally coherent) material developed within special organs, called anthers, of the flowers of seed-bearing plants. Under the microscope this powdery material is seen to be

Influence of Heredity
= male = female
HF = Hay Fever A = Asthma

composed of numerous particles, called pollen grains, definitely and similarly shaped in each respective species of plant.

Fig. I depicts several species of pollen grains.

(See Figure 1).

For a proper appreciation of the hay fever problem, an understanding of a few of the fundamentals of botany is necessary.

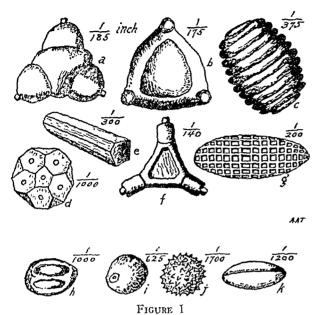

The Flower. A flower may be defined as the

<sup>\*</sup> From the Allergy Clinic, University and Bellevue Hospital Medical College, New York University,

The writer is indebted to Mr. John W. Bicknell, Vice Pres., U. S. Rubber Plantations, Inc., for this information.

aggregate of structures which subserve the function of seed production. (See Figure 2).

Fig. II,1 represents a longitudinal-section of a typical flower; Fig II,2 a longitudinal-section of a peony; 2a, a cross-section of same. This basic plan is the same for all flowers, from the massive Rafflesia arnoldi (36 inches in diameter) to the tiny units of the common weed galinsoga (1/25)

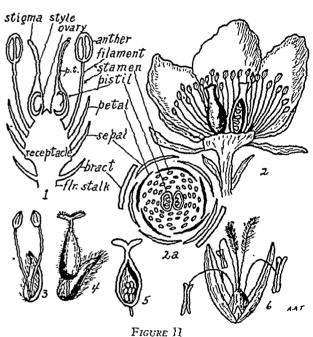

a to g. Pollen grains of several insect pollinated flowers:

of an inch long and 1/75 of an inch in diameter). The differences observed in the 133,000 species of flowers result from variations in size, shape, union of parts, and the presence of absence of the various structures. The basic plan is, however, always the same. (See Chart A.)

A flower is perfect when it has both stamens and pistils; imperfect when only stamens or pis-

tils are present; complete when comprised of pistils, stamens, petals and sepals. These parts are practically always arranged in concentric circles. A plant which has both forms of imperfect flowers is termed monoecious (one household); if the pistillate flowers are on one plant, and the staminate ones on another, the plants are termed dioecious (of two households). The ragweeds, oaks, birches and hickories, for example, are monoecious; some poplars and willows are dioecious.

The function of pollen. Pollen is the conveyor of the male element of generation. After its arrival on the stigma, it germinates, i.e. a tube (pollen tube, Fig. II, 1 p.t.) grows from the

pollen grain through the stigma and style into the ovary. A nucleus passes through this tube to the ovum, thereby effecting fertilization

In the entire Botanic Kingdom there are 233,-000 different kinds of plants, which can be divided into the following classes

Total number of plants 233,000

2 Flowering plants 133,000
There are, therefore, 133,000 different kinds of plants which, having flowers that produce pollen,

are by that token possible causes of hay fever.
Which plants cause hay fever? The answer is
to be found in a consideration of the following

postulates

There are five postulates to be predicated of pollen in relation to its causation of hay fever

1st Postulate The pollen must contain an excitant of hav fever Pine pollen is produced in extraordinarily large quantities and is extremely buoyant, yet it does not seem to cause hay fever There are large areas of Europe and America where pine trees grow most abundantly, yet the incidence of hay fever does not seem to be particularly great in those sections Cat-tail pollen (Typha) may also be mentioned It appears, therefore, that not all pollen possesses the capacity to produce hay fever

2nd Postulate The pollen must be anemophilous, or wind-borne as regards its mode of pollination

By pollmation is meant the transference of pollen from the anther to the stigma of a pistil of the same flower (self-pollmation) or of another flower of the same species (cross pollmation) or of a closely related species (hybridization). There are 4 modes of transference

- 1 Close pollmation—a form of self-pollmation, in which the flower does not open
  - 2 Water-pollmation
- 3 Insect pollmation in which insects (bees butterflies, wasps, flies, etc.) carry the pollen from flower to flower. The insects are attracted by seent, nectaries, colorful and attractive blooms, and pollen as food.

The characteristics of the pollen of insect pollinated plants are, (a) it is often formed in masses called pollina, (eq in the 8,000 orclads and the 5,000 milkweeds) (b) it is frequently cohesive and addictive, (c) there is considerable beauty of form in its incroscopic appearance (Fig. 1)

4 Wind pollimation Wind-pollimated flowers are, as a rule, small, scentless and unattractive. They are most often imperfect, monoecious or

dioccus (Fig 2) Only pollens which are wind borne can cause hay fever

The importance of the question concerning self-pollination vs cross pollination is apparent in Chart II, in which the normal habit of a num

Chart II Indicating the method of pollimition of several important grasses. Rise Timothy and Orchard grass pollens are important causes of hay fever because they are normally cross pollimated.

ber of important grasses is considered. In a study of an unselected group of grass pollen sensitive subjects, it was demonstrated that all give definite positive reactions to each of the grasses enumerated, thus establishing the fact that they have the capacity to produce has fever. When one considers the extensive areas of the globe which are given over to the cultivation of wheat, oats, barley and rice, it is indeed a fortunate circumstance that these grasses are self-pollulated. It will be noted that tye is cross pollulated, which accounts for its great importance as a cause of hay fever in Europe. The same is to be said of timothy and orchard grass.

3rd Postulate The pollen must be produced in sufficiently large quantities Plants differ greatly in their capacity to produce pollen The flowers which are close pollinated (cleistogramous) produce very little pollen; eg Oxalis 400; Impatica 250, Violets 100 per flower

Insect pollmated plants produce comparatively few pollen grains Dandelion 243,000, a Peons 3,645,000, an entire Rhododendron plant 72,620,000

It is a charicteristic of wind pollurated plants to produce extraordinarily large quantities of pollen. It was estimated that a short ragueed plant, which by actual count produced 5,006 racemes (flower clusters) was capable of producing about 1,000 000 000 000 (a nullion nulhon) pollen grams Scheppegrell computed that a Leverfew produced 227,000 000 pollen grains that a grant rigweed plant with only a part of the flower clusters (ricemes) matricel produced 8,000,000 000 grans in 5 hours, and that a field of grass (paspalum) land the capacity to produce 8 000 000 grams per sq. it. Kessler and Durham estimated that an average city lot (1/10 acre) of ragwood produced 100 ozs of pollen in a serson (i.e 60 lbs per acre), and

that in the city of Chicago alone, hundreds of tons of ragweed pollen are liberated into the air each season. Duke and Durham collected the giant ragweed plants growing in an area of scarcely 400 sq. ft. In 3 days these plants yielded over 200 grams of pollen (more than a pint in

4th Postulate: The pollen must be sufficiently buoyant to be carried considerable distances. Buoyancy is a characteristic of wind-borne pollen.

Pollen showers: Riley reports that after a thunderstorm in mid-March, 1873, the ground in certain sections of St. Louis, Mo., was sufficiently covered with pollen to appear as the sprinkled with sulphur. This pollen was thought to belong to a certain species of pine then in bloom in the southern states 400 miles away. Kerner speaks of the pine, etc., pollen shower occurring in the Alps.

Hesselman in 1918, exposed prepared petri dishes on two lightships in the Bay of Bothnia, one 18.6 miles, and the other 34.1 miles from The total number of pollen grains obtained in the nearer lightship, from May 16 to June 26, was 103,037, or 16,205 per square millimeter, (395 per sq. mm. per day). During the same period, the total number obtained of the further lightship was 56,075 or 8,819 per sq. mm. (215 per sq. mm. per day). The pollen was chiefly spruce, pine and birch.2

Airplane tests have been reported by Scheppegrell. Grass pollen was collected on prepared, microscope slides at an altitude of 17,000 feet; and ragweed pollen was found as high as 12,000

The buoyancy of any species of pollen depends on its size, weight, (specific gravity), form and general physical character at maturity.

Size: Some pollen grains are so large that they are easily discernible to the unaided vision. The pollen grain of the Marvel of Peru (Mirabilis jalapa) is about 240 microns in diameter (about 1/100 inch). Some of the forget-me-nots, on the other hand, (e.g. Myosotis alpestris) have pollen grains as small as 3 microns. (It may be recalled that the bacilli of typhoid and of tuberculosis average 2 to 3 microns in length.)

The important hay fever pollens are less than 40 microns in diameter; many of the most important ones are less than 25 microns.

Wind-borne pollen is made buoyant by being dry and powdery, (not sticky and cohesive as in many insect-borne pollens) and either smooth (e.g. trees, grasses, wormwoods) or spiculated (c.g. ragweeds).

The writer is indebted to Dr. Otelia J. Bengtsson for a painstaking translation of Hesselman's article.

The size and form of a few of the important hay fever pollens are here mentioned3: (Chart B)

Weight: The specific gravity of a given species of pollen is obviously an important factor in determining its buoyancy. The following table gives the specific weights of several kinds of untreater mature pollen: i.e. the weight o fone cubic centimetre.

Pollen	Size in Microns	Grains per c.c.
Low ragweed	16	5.0147
High ragweed	18	5,3233
Scotch pine	44	4.9376
Austrian pine	52	5.2462
Timothy	40	9.2580
Corn	88	12 0354

The known buoyancy of ragweed and pine pollen can be easily correlated with their comparative low specific weights. On the other hand, the circumscribed activity of corn pollen is readily correlated with its high specific weight. From these few figures it appears that the larger the pollen grain, the greater the specific gravity; the evident exception in the case of pine pollen is due to the so-called "wings"—attachments of the grain which, in microtome sections, are seen to be air chambers of considerable size.

5th Postulate: The parent plant producing the pollen must be widely and abundantly distributed.

It is well known that patients who suffer from the fall type of hay fever (due chiefly to weeds) are free from symptoms while residing in Europe during their particular hay fever season. In England and the European continent there is no late hay fever season. Yet we find that a number of important late hay fever plants do grow in Europe. In Hooker's British Flora we find recorded several important members of the goosefoot family; Russian thistle (Salsola pestifer), lamb's quarters (Chenopodium album), and sev-Amaranthus retroflexus and eral Atriplexes. Xanthium spinosum and 10 species of dock (Rumex) are also recorded. The Artemisias (wormwoods), so important in Western U. S. are also found in England. On the continent, absinth wormwood (Artemisia absinthium), is a common garden herb. In the vicinity of Trieste, Italy, there grows a species of ragweed (Ambrosia maritima), the pollen of which the present writer has found to give skin reactions comparable to our native ragweeds in each of 40 cases of known ragweed sensitivity tested. Nevertheless, the fall type of hay fever does not occur in Europe because these plants do not fulfill the requirements of the 5th postulate.

Practical applications of the Postulates:

In N. E. North America—north of Oklahoma, Arkansas, Tennessee and North Carolina, and east of the 102° meridian (western border of Kansas), there have been described about 4,045 different species of flowering plants. Of these, about 1,040 are wind pollinated. Consequently, some 3,000 species are immediately removed from further consideration. Moreover, comparatively few of the 1,040 wind-borne pollens are of importance, chiefly because the majority fail to adequately to satisfy the requirements of all the postulates.

In Chart III the five postulates are summarized and applied to the hay fever situation in the Eastern part of the U.S. The degree of compliance of a given species is indicated by the figures 1 to

#### CHART III

Chart III: Showing the degree of compliance with the five postulates of a number of species of pollen. Those which are italicized are among the most important in the Eastern sections of the United States.

The etiologic mechanism of Hay Fever. (1) Reagins. It has been demonstrated that the hay fever subject has circulating in his blood, an antibody, termed reagin, which is specific for the particular pollen or group of botanically related pollens to which he is sensitive. The presence of reagins is demonstrated by sensitizing a site in the skin of a normal individual with the serum of a patient sensitive to a given pollen. If such a passively sensitized site be tested with an extract of the pollen, a definite reaction will be obtained, whereas other areas of the skin, not sensitized, will be found to be negative. If an individual is sensitive to both grass and ragweed pollen, reagins for both these groups will be found present in the serum. A site of normal skin passively sensitized with such a serum may be exhausted by repeated injections of, e.g. ragweed pollen extract, but will continue to give reactions to a grass pollen extract.

(2) The tissue factor. It is well known that some individuals have reagins in the circulation,

The writer wishes to acknowledge the valuable assistance of Mr. Jesse Knapp, Director of the Pollen Gardens. North Hollywood, Cal., in placing at his disposal numerous specimens of plants, pollens and seeds.

i.e., give positive skin tests to a given pollen extract, who, nevertheless, do not develop clinical hay fever, though normally exposed to the pollen in question. Evidently, in such instances, skin sensitivity is developed before mucous membrane sensitivity. Consequently, another factor must be present in addition to circulating reagins, and the excitant of pollen. This factor is called the "tissue factor," and is represented by the so-called shock organ. The difference in shock organs, and the variation in their capacity to react clinically enables one to explain the variation in symptomatology observed among hay fever subjects; some have a preponderance of eye symptoms, others

suffer almost entirely from asthmatic seizures,

There are, therefore, three factors requisite for the production of hay fever:—(1) specific reagins, (2) shock organs, (3) the pollen excitant. It is of interest to note that a certain specificity must be ascribed to the shock organ, for there are not a few instances of patients who suffer from one type of hay fever (e.g. ragweed), who give positive skin tests to other pollens (e.g. grasses) that is, they have reagins related to grass pollens in their circulation, who, nevertheless, do not develop clinical hay fever, though exposed to the pollen in question.

## THE ROLE OF THE VEGETATIVE NERVOUS SYSTEM IN EPILEPSY AND MIGRAINE\*

By SAMUEL BROCK, M.D., NEW YORK, N. Y.

N discussing the relationship of the vegetative nervous system to epilepsy and migraine, two important questions arise: (1) Are these paroxysmal disorders directly due to disturbed function of the vegetative nervous system? or, (2) Are certain symptoms and signs merely expressions of abnormal function of the vegetative nervous system, irrespective of any causal relationship between the latter and the former? Obviously the more important first issue involves the complicated question of etiology, namely, does an abnormality in the vegetative nervous system set off the spark. Let us first consider the convulsive state. Elsewhere, I have stressed the important part played by the cerebral vascular bed. O. Foerster observed at least one hundred times a preparoxysmal vaso-constriction and anemia of the exposed brain with a diminished volume. The tonic convulsion then occurs with a rapid fall of cerebrospinal fluid pressure. Venous stasis comes on rapidly, accompanied by a great increase in brain volume and cerebrospinal fluid pressure. The stasis now produces cortical irritation and the clonic (Jacksonian) phase appears. This vasomotor theory (Nothnagel) explains the attack's sudden onset and cessation, and the radiation' of a Jacksonian cortical attack. The sensory aura and the post-paroxysmal weakness may be ascribed to transient loss of function from local anemia.

Since these observations has been confirmed by others (F. Kennedy and Horrax) it becomes necessary to inquire whether cerebral vasomotor nerve fibres have been demonstrated by the histologist and whether the experimental physiologist has been able to observe vasomotor changes in the cerebral blood vessels of animals. Thanks to the careful histologic studies of Stöhr, Jr. (recently confirmed in this country by Hassin), one can definitely state that the blood vessels of the pia and the choroid plexus are well supplied by nerve fibres. Furthermore, in their valuable studies Forbes and Wolff show that the pial arterioles contract immediately after stimulation of the cervical sympathetic nerve and after intravenous injection of hypertonic solutions of adrenalin and pituitrin and hyperpnoea, and dilate after stimulation of the central end of the cut vagus and other procedures. These studies show that the circulation of the mammalian brain is controlled in part by cerebral vasomotor nerves.

Moreover, the eminent German neuropathologist, Spielmeyer, in 1926 suggested that the angulation of small blood vessels in certain of the cortical layers of Ammon's horn may be the cause of cell changes found there in epilepsy.

I have seen a most marked pallor spread rapidly over the face of a young epileptic woman with the onset of a petit mal attack. The normal ruddiness appeared with the return of full consciousness.

These clinical, histological and experimental observations emphasize the importance of the cerebral vasomotor system in any discussion concerned with the pathogenesis of the convulsive state. Yet it may well be that a direct physico-chemical action may take place on the vessel wall without the intermediation of nervous elements. In this connection Weiss, Lennox and Robb have offered evidence showing that arterioles, capillaries and venules of the

<sup>\*</sup> Read before the Second Annual Graduate Fortnight (New York Academy of Medicine), Bellevue Hospital, October 15, 1929.

human brain promptly dilate following the intravenous administration of histamine phosphate Epinephrine acts as an antagonist to histamine These two substances may act by way of a local chemical vasomotor regulation

One may ask what role the cervical sympathetic plays in the production of convulsions A number of observers have removed the cervical sympathetic chains. Some improvement has been reported by Tinel, Bojovitch and Hirsch and coworkers. Others note disappointing results. Poerster suggests sympathectomy only in those who manifest disturbed function of the cervical sympathetic. In one such case Lennov and Cobb report a favorable outcome.

In respect of the rest of the sympathetic and autonomic nervous system not much can be said. While the epileptic seizure itself is associated with a state of sympathetic domi nance, the interval period reveals a pathological lability and responsivity of the vegetative nervous system with no especial vagal or sympathetic dominance Some believe that mi grame and epilepsy are due to disorders of function in the vegetative nervous system Bolton (1924) goes so far as to say that asthma the edema of urticaria, dysmenorrhea, migraine and epilepsy are induced by toxins acting upon, and producing imbalance in the vasomotor apparatus Popea and his co workers (1925) studied the effect of vagus paralysis using atropin and change of posture. In 45 patients the following results were obtained In 6 patients a seizure resulted in 10 minutes, in 1 patient a seizure resulted within 30 minutes, in 15 patients a seizure resulted within 20 hours. The oculo cardiac reflex is a test of vagus activity, measured by the slow ing of the heart rate when pressure is applied to the eye balls. The epileptic shows consider able variability of response to this test from time to time. In those afflicted with frequent scizures the reflex is most increased. It is especially increased before the seizure and normal, or inverted, afterward

In the field of metabolism and physico chemistry new and seemingly valuable work has appeared which shows the importance of the vegetative system. In their excellent monograph, Lennox and Cobb summarize our present knowledge. Felix Frisch has also written a stimulating work on the subject ("Das Vegetative System der Epileptiker," J Springer, 1928). Frisch, Walter F. Kraus, de Crinis and others emphasize the findings in the interval or preparoxysmal phases of the disease.\* While the vegetative activity to be

discussed belongs strictly speaking to the field of metabolism, the part played by the vegetative nervous system is so intimately concerned that I do not feel that I am overstepping the limits imposed by the title I am quoting in extenso from my previous article

"In the sphere of metabolic activity they dem onstrated remarkable findings only disclosed by serial studies. Firstly, in the preparoxysmal phase, a water and NaCL retention were often found (associated naturally with oliguria and a gain in the patient's weight). Secondly, rare cases showed the above during the interval period with a relative water NaCL diuresis just be fore the attack. Thirdly, certain cases showed a retention of NaCL without a corresponding water retention in the tissues. The first group is associated with a hypochloremia, the others by markedly variable blood chloride values.

"The other electrolytic constituents of the blood show considerable variations. The blood calcium is under normal in the interval, and rises considerably above normal just before the convulsion, as shown by serial studies Potassium values vary greatly with no relation to the time of the attack Calcium and po tassium are antagonists Calcium ion concen tration leads to a splitting off of H (acid) ions, potassium to splitting off of OH (alkaline) ions Hence, calcium attracts the acid ions into the blood stream which leads to relative alkalinization of the tissue cells. It is interesting to note that relative richness in calcium and magnesium diminishes the convulsive tendency of nerve centers, relative richness in potassium and sodium increases it. This coincides with the retention of Na and the withdrawal of tissue calcium in the pre-paroxysmal phase Increased blood calcium has been found in eclampsia (Consoli) and during the menses A disturbance in the acid base equilibrium is present in epilepsy. In the intermediate stages of metabolism endogenous acids appear which disrupt the alkali CO2 coalition This acidosis is manifested by-(1) a reduced CO2 combining power (de Crinis), (2) a lessened alkali reserve (determined by titration) ie hypocapma, (3) an increase of the diffusible alkali and a concomitant diminution of the total alkalı (Frisch and Walter), and (4) a 'dy sregulation' of the NH, concentration However, the undisturbed regulatory mechanism of the epileptic prevents any actual change in the blood's reaction. The increased convulsive tendency brought about by hyperventilation is not accompanied by an actual change of the circulating blood to an alkaline reaction

"Serial basal metabolism determinations reveal a unique, marked variability in the amounts of oxygen consumed. The variations may

<sup>\*</sup>These important vegetalire activities have been analyzed in a previous paper of mine. Fp lepsy and the Convolute State (A Y State Journ of Med 29 1929, 875 882) to which the reader is referred.

reach an amplitude of 40 per cent. The values of the specific dynamic action of protein also show similar but less marked fluctuations. In 60 per cent of the cases, the reaction of the protein addition remains under normal. The nutritional investigations of Kauffmann and de Crinis show a preparoxysmal lessening of oxygen consumption and carbon dioxide production but without parallel curves. Carbohydrates, proteins and fats are all involved. Consequently variations in the respiratory quotient occur revealing incomplete oxidation. The variations are believed to be due to disturbances in the activation of the inactive circulating hormones. This is the result of changes in the peripheral autonomic cellular metabolisms and varying impulses emanating from the central nervous system control. It is significant that acidotic animals show a diminution of oxidative processes (Chvostek).

"The serum protein colloid picture of the epileptic shows a characteristic deviation toward phases of high dispersion, which is especially manifest preparoxysmally and during a series of attacks. The amount of the total blood protein is raised; such increase is taken up entirely by the albumin quota. Remarkable variations are encountered here also. The coarse dispersion fraction gives normal values. This deviation to higher dispersion conditions the increased water retention and is associated with the increased calcium content of the blood. The typical blood changes are to be regarded as the 'humoral mirror picture' of the tissue changes.

"The lessened nitrogen excretion in the preparoxysmal phase is interpreted as the consequence of the inhibited protein splitting and synthesis at this critical time so that actual nitrogenous intermediate products circulate about which have no physiological but rather a toxic action.

"The extraordinary significance of these complex collodial changes is shown by the fact that drugs producing deviation to the right (high dispersion) excite convulsions and those that provide a left deviation (coarse dispersion) inhibit seizures.

"The residual nitrogen and blood sugar fluctuate but are elevated preparoxysmally. The blood cholesterin is also elevated at this time.

"Electrolytic changes, colloidal reactions, hormonal influences, vegetative nervous impulses play in concert upon the cell's surface (colloidal 'membrane') and interior, altering the permeability of the former and the irritability of the entire unit. Höber illustrates these complex interrelationships in the treatment of epilepsy as follows: (1) sedative therapy erects a narcotic barrier between the

cell and its milieu; (2) withdrawal of NaCL and calcium administration dehydrate the colloidal 'membrane' and produce a 'condensation barrier;' (3) the attack itself 'unloosens' the cell so completely that its responsivity to stimuli is much reduced for a considerable period.

"In Table I, I have enumerated these important changes. The peculiar heightened dispersion of the colloidal protein produces retention of water and increase of calcium. The lessened oxidation permits the appearance of acids (which disrupt the acid-base equilibrium) and causes an increase of the residual nitrogen. The latter may also be, and the increased blood sugar and cholesterin are, attributable to sympathetic hormonal dominance.

"As a result of their studies, Kraus and Frisch emphasize the disturbances in the physico-chemical life of the body cells and fluids as the essential disturbance in epilepsy. The remarkable fluctuations present in all the individual physico-chemical processes again reflect the unstable cell-blood exchange. A heredconstitutional defect (comparable that seen in diabetes mellitus) must underlie this remarkable disease.

#### TABLE I.

Physico-chemical Changes in the Preparoxysmal Period of Epilepsy

- 1-Retention of water and sodium chloride.
- 2-Increase of blood calcium (from subnormal).
- 3-Deviation to high dispersion of blood colloidal protein (albumin), so-called deviation to the right.

- a-Lessened alkali reserve (hypocapnia), b-Reduced CO<sub>2</sub> combining power, c-Diminution of total alkali with increase of diffusible alkali.
- 5-Lessened oxygen consumption and carbon dioxide production. Falling of the respiratory quotient.
- 6-Increase of residual nitrogen in blood.
- 7-Increase of blood sugar.
- 8-Increase of blood cholesterin.
- 9-Increase of electrical excitability of peripheral nerves. Dominance of sympathetic (adrenal) hormonal influences."

Lennox and Cobb stress the convulsogenic role played by anoxemia, pointing out that the oxygen lack in alkalosis, in insulin hypoglycemia, in sudden anemias, is associated with convulsions. In one of their patients, the number of convulsions could be definitely increased by lowering the amount of oxygen respired; furthermore, overventilation (an adequate provocative measure for the production of the seizures) failed if the air contained a high degree of CO<sub>2</sub> or was rich in oxygen. Anoxemia and alkalosis go hand in hand. It is known that there is an increased irritability of nerve cells in the presence of alkalosis.

Again, edema and the question of the permeability of cell membranes are important factors. Landis showed that in the presence of stasis and poor oxygenation, four times the amount of fluid escapes from the capillary

walls of frogs than normally. Syz noted that a convulsant dye penetrated more readily into frogs' brains if asphyxia or brain injury had occurred. Observations of this kind lend weight to the theory that edema of the nerve cells is the cause of the eclamptic convulsion.

The following table (Table II) from the monograph of Lennox and Cobb, summarizes

certain important points:

#### TABLE II (From Lennox and Cobb)

Tentative List of Physiological Changes in the Brain Which May Effect Seizures

#### Conditions which may tend to

Present Seizures Precipitate Seizures Rich supply Poor supply Oxygen Acidosis (fasting, fat Alkalosis diet)
Ingestion of acids or acid forming salts
Breathing high CO, Acid Base Ingestion of aikali Hyperphoca—' blowing off" CO2 Equilibrium High chloride (?) Low calcium (tetany) Hypoglycemia (insulin) Chemical Constituent Low chloride (?) High calcium Water Balance Dehydration Edema Tissue Permeability Decreased Increased Intracranial Increased Decreased Intracranial Circulation Normal Impaired

Lennox and Cobb point out that "the degree of general anoxemia or alkalosis induced was much greater than ever occurs spontaneously Therefore, one must assume in epileptics physiological changes in the brain which are not reflected in the composition of the peripheral blood. Such local physiological changes might be precipitated by sudden alterations in the flow of blood through the brain." These authors believe that the following might explain the production of a convulsion: Contraction of cerebral (presumably pial) arteries under sympathetic stimulation. This would "lead to decreased blood flow in the capillaries," resulting in "deficient oxygenation and consequently, alkalosis of the brain tissue. Under these conditions one might expect an increased passage of fluid outward through the capillary walls, with resulting edema. Some or all of these factors (oxygen lack, alkalosis, edema, change in electrolytic equilibrium, increased intracranial pressure) might stimulate nerve cells to the point of discharge with resulting muscular spasm. Apnea and muscular contraction would result in a great accumulation of lactic acid and CO2 in the tissues, producing a condition of acidosis which would initiate a reversible reaction, leading to a better utilization of oxygen, a restoration of circulation and a release of muscle spasm."

So much for the causal relationship of abnormalities in the vegetative system, especially the vegetative nervous system in the production of the convulsive state. The second issue is of less importance, namely, the symptoms and signs attributable to vegetative nervous system disturbance in the clinical picture of epilepsy. Here we enter a fascinating realm, one in which the minor elements, petit mal, the visceral variants and the vasovagal crises of Gowers mainly engage our attention.

In the cataclysmic motor explosion of grand mal one can distinguish signs of vegetative nervous system disturbance. I refer to constant dilatation and fixity of the pupils, the arly pallor succeeded by redness and cyanosis, the occasional loss of urine and feces, the salivation and perspiration

Yet, in the smaller, fragmented states one can study certain features of the symptomatology of epilepsy with greater detail the term vagal and vasovagal attacks Gowers drew attention to paroxysmal disturbances in gastric, cardiac, respiratory and vascular organs due to abnormalities in the vegetative nervous innervation I can do no better than to quote the great English master (Gowers, W. R., "Borderland of Epilepsy," J. & A Churchill, London 1907): "The symptoms comprehend subjective gastric, respiratory and cardiac discomfort, sometimes cardiac pain and even a sense of impending death. With the vagal symptoms there are often combined a slight mental change, and also disturbance of the vasomotor centre, causing constriction of the vessels and coldness, especially of the extremities. Associated with the latter may be some sensory impairment and often also a form of slight tetanoid spasm. These features vary much in relative proportion, so as often to obscure the essential resemblance. When the vasomotor spasm preponderates, the case may seem to differ from the type more than it really does. Such cases may be termed 'vasovagal.' The attacks are never really brief: they seldom last less than ten minutes and more often continue for half an hour or more. There is a sudden onset of slight symptoms, rapidly increasing, and the ending is gradual. The seizures recur at varying intervals, often for months or years. Women suffer more frequently, but these attacks are also met with in men. This, and the fact that the pneumogastric and vasomotor systems are readily influenced by emotion, have probably led to the frequent submergence of these attacks beneath the vague conception of hysteria, a conception which conceals whatever it covers. . . . The vagal symptoms are chiefly sensations referred to the stomach, the respiratory system and the heart. We may probably ascribe to the gastric nerves a sensation referred to the epigastrium, generally described as a sense of oppression or of fulness, but often indescribable. It begins suddenly, irrespective of the state of the stomach or of its functions, and often seems to ascend to the chest, very seldom to the throat or head, as does the aura of epilepsy. There is seldom nausea and never vomiting. Even more common, especially as an early symptom, is a sense of respiratory distress, of difficulty in breathing. It is sometimes so intense as to amount to orthopnea, and to compel the sufferer, if lying, to sit upright, although there is no corresponding sign of impairment of breathing. With this may be combined cardiac symptoms, discomfort, acute pain in some cases, often a sensation of sudden stoppage of the heart, followed by rapid action. With the dyspnoea, or the cardiac sensation, or both, is often associated a sense of impending death, so intense that no recollection of its falsity in preceding attacks prevents the conviction of its present reality. It naturally causes alarm, but apart from any cardiac sensation there is sometimes a sense of vague fear and dread, which is recognized to have no adequate

"Although there is no impairment of consciousness, a slight peculiar mental state is common, and may even be the first symptom. It is generally described as a slowness of mental operations, a difficulty in thinking or in concentrating attention. Trifling as it may seem, it always begins suddenly and strikes the patient as a state quite unlike the normal condition. Sometimes it involves a slowness in speaking, but this seems partly due to the sense of dyspnea. Another occasional feature is a sense of unreality in what is seen. A sudden sense of physical fatigue is sometimes an initial symptom.

The vaso-motor spasm sometimes attains a high degree. To it the symmetrical coldness is certainly due, for the pulse becomes small at the same time. When general, there is pallor of the face. Shivering is common and may amount to definite rigor, but this occurs when the coldness is beginning to lessen. With the coldness of the extremities, tingling and numbness in them are often described, and sometimes there is slight tetanoid spasm."

In a discussion of epileptic variants, another distinguished English neurologist, S. A. K. Wilson, goes into great detail concerning the symptomatology of the vasovagal attacks. In the cardiac sphere,—palpitation, a fluttering or thumping sensation, with a feeling of impending dissolution constitute the picture of pseudo-angina pectoris. In the respiratory sphere, tachypnoea, dyspnoea or more specifically a feeling of suffocation in the throat, complete the picture. If vasomotor phenomena dominate, then icy coldness with perspiration and shivering succeeded by warmness and hot

flushes, appear. Among the gastric sensations are an empty hollow or "creepy" epigastric feeling with nausea followed or accompanied by eructations of gas and flatulence. Vague anxiety, fears of death or impending catastrophe, a sense of unreality or even an abnormal alertness or a trance-like state, or giddiness, add their quota of distress. The passage of large quantities of limpid urine may appear toward the close of the attack. The variety of symptom combinations found in these episodes is almost infinite. The important feature is the vegetative nervous system display. As Wilson states, these symptom complexes are found as epileptic variants, in anxiety neuroses and occasionally in visceral disease. The family history not infrequently reveals epilepsy, neuroses, insanity or migraine. Occasionally this visceral variant type of seizure is mixed with a migrainous element, as in a recent unusual case coming under my observation. A married woman of 32 had been suffering from the following seizures for six years: She suddenly is beset with a feeling "that blood is leaving her body," becomes weak and sits or lies down. Nausea follows, she belches up gas and her face turns pale. These seizures are unassociated with any impairment of consciousness; they appear in a series of one to fifteen in a day with periods of remission of two or three months. As bearing upon the epileptic nature, it is to be noted that they not infrequently awaken her from sleep. They are invariably followed by severe frontal or occipital headache which does not occur apart from the attacks. These headaches have a definite migraine-like quality, and it is interesting to note that one maternal uncle was severely afflicted with hemicrania. These seizures may follow excessive fatigue or emotional upsets, but not infrequently come on without apparent

The examination showed a visceroptotic, asthenic type of woman and an occasional extra-systolic irregularity of the heart beat.

Seeing that these lesser paroxysmal manifestations are non-fatal, our knowledge of the pathology underlying these states is very incomplete.

Very recently, however, Wilder Penfield described a very interesting syndrome which he called diencephalic autonomic epilepsy. The symptoms were due to the presence of a small tumor, a cholesteatoma, in the anterior part of the diencephalon, i. e., between the anterior upper parts of both optic thalami within the third ventricle. The patient, a woman of 41, was subject to unusual attacks. The prodromata consisted of restlessness and a request for ice in the mouth. Sudden vasodilatation of skin occurred in areas supplied by the cervical

sympathetic (face and arms) and sudden rise in blood pressure, S 110 to 210, D 68 to 100 Nextly appeared varied combinations of the following lacrimation, diaphoresis, salivation, dilatation (or contraction) of the pupils, occasionally protrusion of the eyes, increase of rate and pressure of pulse, marked lowering of respiratory rate with Cheyne Stokes char acter, and elicitability of pilomotor reflexes Occasionally goose flesh appeared over the patient's shoulders with the increasing rate of respiration, to disappear in the appoeic phase Consciousness was rarely lost. Then the skin blush began to disappear, the blood pressure fell and the pulse weakened A few hiccups, transient shivering and Cheyne Stokes respi ration concluded the attack There were many such seizures While incontinence of urine occurred only once, she never could void during the attacks, and catheterization became necessary There were no convulsions Questions were answered by monosyllabic replies The temperature fell well below normal during the most severe series of attacks. She died of respiratory failure From a study of the pathol ogy, Penfield concludes that this rich vegetative symptomatology was due to periodic discharges on the part of the nearby vegetative nerve centers (the nuclei in the gray matter about the third ventricle), due to the irritation induced by the presence of the tumor Though rare such observations as these are most im portant in that they give a pathophysiological basis to clinical signs which rarely find patho logical confirmation

Let us subject migraine to the same two lines of inquiry (1) Are these paroxysmal head aches, with their accompanying symptoms, directly due to disturbed function of the vege tative nervous system? or (2) Are certain symptoms merely expressions of disturbed function of the vegetative nervous system, the causal factors being further removed and unknown?

Concerning the first issue, Jelliffe goes so far as to state that migraine is a vasomotor disturbance due to a variety of stimuli (physical, chemical, somatic reflex, emotional, etc.) acting upon the vegetative nervous system A vasomotor spasm is the result. This theory of vascular spasm is the most attractive of the many suggested. Oppenheim points out that it explains best the rare permanent residuum which supervenes in some instances of migraine. In such cases it is believed that thrombosis has occurred, permanent structural damage followed Indeed, Oppenheim cites a proven instance of thrombosis of an internal carotid artery causing a permanent after effect The evidence of a vascular basis for migraine finds support in other directions. Bramwell

and McMullen (British Med Jour 2, Oct. 30, 1926, 765-775) have described alterations in the calibre of the retinal arteries during migrain ous attacks. All of these facts lend weight to the viscular spasm theory of migraine.

With respect to the second question namely, the symptoms and signs in migraine which may properly be ascribed to disturbed function in the vegetative nervous system (regardless of the real causes of migraine), we enter a rich field. We may begin with the gastro intestinal tract Salivation very occasionally accompanies an attack of migraine. As is well known, nausea and vomiting very frequently occur during or at the close of an attack and are most important symptoms of this parox ysmal disorder Gastric atony and enlargement have been described during and following the seizure Diminution of salivary secretion diar rhea or constipation may herald an oncoming attack, occur at its termination or follow it The importance of some of these gastro in testinal symptoms is attested by the fact that they may occur without the headache as mi graine equivalents. At times vomiting spells may be regarded as larval attacks in migrain ous individuals. Indeed some instances of cyclic vomiting in children seem to belong to this category Paroxysms of abdominal pain especially about the umbilicus (intestinal colic) in children have been regarded as migramous equivalents In some of these cases the children have not been victims of typical mi graine, but the parents have been so afflicted At times the true explanation of the abdominal pains only comes to light when typical seizures supervene years later

There are various inconstant symptoms of migraine, involving vasomotor and pupillary mechanisms which seem to point to sympathetic nervous system excitation on the one hand or paresis on the other Thus occasion ally facial pallor, cool skin, increased saliva. dilatation of the pupils, narrowing of the temporal arteries, and a small pulse will occur in an individual during the attack. In others, the face and conjunctiva will redden, the visible arteries dilate and throb, the pulse will be full. the pupils will constrict and hyperidrosis (even unilateral) occur Indeed, two forms of mi graine have been described, namely a sympathico tonic (angiospastic) and a sympathico paralytic On the other hand, excitatory and paralytic phen mena often coexist or change from one to the other type, many sufferers show no such abnormalities. In this connection Oppenheim stresses tenderness of the superior cervical sympathetic ganglion during and be tween the attacks

A number of other related phenomena occur

Chilliness, coldness and clamminess of the extremities, goose flesh, numbness, a prickling in the extremities, yawning and lacrymation, have been described just before or during a paroxysm. Infrequently, polyuria or diarrhea occur at the end. Occasionally the pupil will dilate on the affected side. Commonly both pupils become constricted.

Rarely the vasomotor features are most striking; the reddened flushed part may become edematous or even show erythromelalgic features. Indeed hemorrhagic phenomena have been observed, namely, in the conjunctiva and retina, and epistaxis described. Unusually temperature elevation occurs.

As in the convulsive state, the menstrual period seems to be a precipitating factor.. Likewise, sleep so often terminates both types of attack.

In conclusion one may say that in both epilepsy and migraine the vegetative nervous system gives ample evidence of disturbed function. At the present time the facts seem to point to involvement of the cerebral vascular mechanism as the essential mediate agency of the attacks. Whether the cerebral vascular bed is upset by indirect nervous or direct physico-chemical influences is still an open question. The basic causative factors are still unknown.

# ABSCESS OF THE EPIGLOTTIS\* Case Report

By G. B. GILMORE, M.D., NEW YORK, N. Y.

HE fact that purulent inflammations of any part of the larynx are rare prompts me to report this case of an abscess seated on the epiglottis.

Mr. P., age 34, presented himself on Nov. 15, 1929, for the relief of a very severe pain in his throat on the left side just below the angle of the jaw. He swallowed with difficulty and was conscious of something in his throat as he expressed it, "That didn't belong there." There was no respiratory distress, history of foreign body or change in the sound of his voice. The onset was sudden eighteen hours previously; first a tickling sensation followed by acute pain. His temperature was 99.5 and pulse 100.

On examination the epiglottis was readily seen behind the dorsum of the tongue, enormously enlarged, water-logged in appearance and of a pale pink color. With the aid of a laryngeal mirror the greatest amount of tumefaction was observed to the left of the mid-line. The picture was that of an acute oedema. The other parts of the larynx and pharynx were normal.

Following the application of a weak cocaineadrenaline solution several small incisions were made in the area of greatest swelling, liberating a thin bloody`fluid. The patient was advised to remain in bed, take ice and iced drinks internally and keep an ice collar around his neck. Stimulants were not ordered as his general condition was very good.

Twelve hours later he noticed he was expectorating foul smelling material. Examination

revealed creamy pus with an offensive odor exuding from one of the small incisions made the previous day. This opening was enlarged and more pus liberated. The pain was greatly relieved and swallowing became easier.

The abscess drained for four days with a gradual diminution in the size of the epiglottis. At the end of ten days healing was complete and the patient was back at work. During this time the incision was dilated daily and the abscess cavity painted with tineture of iodine.

It is perfectly obvious that an acute oedematous septic inflammation of any laryngeal structure is a very dangerous thing. The epiglottis is generally involved first, but contrary to the pleasant outcome in this case the inflammation does not stop there but spreads rapidly along the aryepiglottic folds and causes an alarming narrowing of the air-way. Death from suffocation or cardiac failure is very common. The heart is quickly overcome by the toxins of the streptococcus which is the offending organism in the great majority of cases. The infection can also spread forward under the tongue and produce a Ludwig's Angina with all of its horrible suffering. The pharynx is generally not involved at the same time.

The physician in attendance should be in close touch with his patient at all times so that tracheotomy may be performed whenever respiratory distress presents itself. This is often a life saving measure and should be resorted to at the very first sign of labored breathing. Early incision, multiple oftimes, into the septic area is essential and the favorable outcome of this case, I believe, was due to this procedure

Annual meeting June 2-4, 1930, Hotel Seneca, Rochester, N. Y.

#### MILESTONES

The preparation of the program of the Annual Meeting of the Medical Society of the State of New York on June 2-4 is a milestone marking a year's progress in the art of medical practice. The milestone is not the road, but is a marker on the highway which leads from the known past into the realm of the unknown future. New faces appear on the road, and newer and more direct methods of travel are

developed, but the old and the tried determine the rules of the road and the direction in which it leads. There will be some changes of drivers as each milestone is passed, some roughness of the road will be smoothed out, and possibly some changes of route will be made as crossroads are reached; but the medical profession will continue to develop the main highway in the direction taken in the past.

#### BASIS OF THE SERVICE OF THE LEGAL COUNSEL

The Medical Society of the County of Kings has asked the Council of the Medical Society of the State of New York to express an opinion regarding the defense of two members of the Society under conditions as follows:

#### Case 1

This physician joined the Kings County Medical Society in November, 1926. Two months previously he had treated a patient, and sent a bill for \$100. A few months later he started a law suit for the collection of the bill. The patient replied with a counter suit for \$1,000 against the doctor for "Breach of Contract," the time for beginning a malpractice suit having expired.

The Kings County Medical Society asked the question "Is the member entitled to defense in the suit?"

The answer is found in the statement of the conditions under which malpractice defense is given. The defense was first organized in the year 1901 by the New York State Medical Association and was continued after the Association was amalgamated with the State Society on December 9, 1905. Resolutions setting forth the conditions of malpractice defense were adopted by the Council on December 5, 1913, and approved and adopted by the House of Delegates on April 27, 1914, and again on March 29, 1926, the first section of which reads:

"Members shall not be entitled to malpractice defense if the acts in the suit for which they make application for defense were committed prior to their admission to membership in the State Society.

#### Case 2

This doctor was threatened with a suit by a nurse who developed conjunctivitis while she was caring for a new born infant. The doctor had applied prophylactic measures, and yet the child had developed mild conjunctivitis, although no gonococci were found on microscopic examination. The nurse claimed negligence on the part of the doctor, in that he should have warned her of the infectiousness of the discharge.

The question raised by the Kings County Medi-

cal Society was "Should the State Society defend the doctor?"

There was a question whether or not this case met the conditions of malpractice defense, inasmuch as the nurse was not a patient of the physician. But in consideration of the fact that this was a border-line case, the State Society and the Insurance Company agreed to defend the doctor with the understanding that the defense should not be considered a precedent on which to base future decisions. However, there has been no need of defense, for no papers have as yet been served on the doctor.

The facts in these two cases were submitted to the Council of the Medical Society of the State of New York at its meeting held December 12. 1929. The Council referred the matter to a subcommittee on Group Insurance, the Secretary, and the Legal Counsel, which made a report to the Executive Committee on February 13, 1930. The complete report was sent to the President and Secretary of each county society by order of the Executive Committee.

There exists in the Society a mistaken idea of the meaning of "Counsel' to the Society" and of the duties of his office, and this misunderstanding has reached such an exfent that county societies, committees, and individual members are continually requesting legal opinion upon questions of ethics, interpretations of both State and County By-Laws, rulings on internal dissensions and many others of like character, together with opinions upon individual affairs which should be referred to private counsel.

In addition to the duties appertaining to malpractice defense, Mr. Brosnan is retained by the Council of the Society as General Counsel and acts in an advisory capacity to the Legislative and Administrative Bodies, i.e., the House of Delegates, the Council and the Executive Committee, rendering service also in such other matters as may be referred to him, providing such are consistent with the customary duties of his office.

All questions or requests for information by committees, county societies, or individuals must be referred, therefore, through the Secretary's office to the Executive Committee, with which the Counsel sits.

## PHOTOGRAPHING THE INTERIOR OF THE STOMACH

The first article in the scientific department of this Journal is on the subject of photographing the interior of the stomach, thereby obtaining an actual picture of an ulcer, or other pathological condition. The photographs are obtained by means of a pin hole camera suspended in the stomach while it is distended with air. The camera itself is of the diameter of a stomach tube, and yet each flash of light makes sixteen pictures, each about one quarter of an inch in diameter, covering almost the entire area of the stomach. The camera is a useful adjunct to other means of diagnosis, especially when it is used in connection with the X-ray.

#### THE ANNUAL MEETING

This issue of our Journal contains the announcements of the coming Annual Meeting of the Medical Society of the State of New York on June 2-4, in Rochester, so far as they can be given out with certainty at the present time

The Scientific Program The first feature of which physicians usually think is the program of the scientific sections which begins on page 458 of this issue The speakers and subjects have been chosen by the Committee on Scientific Work by a process of volunteering and by invitation to men of outstanding ability and at-The excellence of the program in tainments past years is indicated by the reception which the papers have received when they were published in the Journal-for it is the policy of the State Society to publish them during the year, except those in which a mutual agreement is reached between the officers of the State So ciety and the authors. A doctor attending the annual meeting will be able to make a personal choice of speakers and subjects with the assurance that the Journal will enable him to review those whom he hears and to read those whom he misses

The Technical Exhibit The second feature which will appear to the physician is the exhibit of medical wares. This exhibit is no longer merely a commercial display, but it is educational and will be called the Technical Exhibit following the example of the American Medical Association. It will be a continuous demonstration throughout every day. The air dience will be the individual doctor who strolls by a booth in his time of leisure, and stops to talk to the demonstrators. Here the average doctor will find those articles which he uses in

his own individual practice of medicine. Every doctor, for example, uses external applications be they electricity, light, or poulties. Let no physician delude himself that the old fashioned poultice and hot water bag are gone out of existence. The exhibits will enlighten the doctor regarding modern methods of applying time-honored remedies as well as the more modern ones, to the satisfaction of the patient

Again, take the subjects of drinks and the administration of medicines in liquid form. The physician is frequently asked about popular waters and fruit juices, and he is expected to give an intelligent opinion of their virtues, and to prescribe them in a form which is agreeable to the patient. A study of the Technical Lyhibit will enable the average physician to give scientific answers to questions to which he is often compelled to give evasive replies because of his unfamiliarity with common remedies and pieces of mechanism. The Technical Exhibit is of importance to every physician attending the annual meeting.

Other Features The House of Delegates will convene at two o'clock on the afternoon of Monday, June 2 and continue in session through the evening with an intermission for supper, at which the delegates and officers will dine together. The meeting will continue on I uesday morning closing with the election of officers.

The annual dinner and the Anniversary meeting will be held on Tuesday evening

The Hotel Seneca will be the headquirters of the Society and will provide room for the meetings and the Technical Exhibit. The plan of uniting all the features of the annual meeting under one roof will appeal favorably to every member.

## LOOKING BACKWARD THIS JOURNAL TWENTY-FIVE YEARS AGO

Chloroform or Death at Sixty A quarter of a century ago Dr Osler perpetrated a withcism about chloroforming men over sixty, which was taken all too scriously by the new spapers An editorial on the subject constitutes the first article of this Journal of April 1905, which says

"The challenge, as presented to men over 60, is the mutility of life—the terms, chloroform or death. All of which is absurd on its face, masmuch as so many fence around so grave a question. That the whole matter was an adroit contribution to an autobiography is not worth a moment's consideration. Statistics are muddled—they are neither as clear nor as valuable as maxims. Tame, too, may be in toned by a self-owned megaphone or thrilled.

through an angelic trumpet and at a proper distance may seem merely the roar of traffic

"The lesson of all ages which appil in the count is to the effect that the admiration of the public is based upon achievement opportunity, perseverance and the economy of time. Therefore let all of us in the present age of velocity not especially court the dangers of the crowd for the sike of the solitude of the pinnacle Mankind until the crack of doom will have gentle quarrels with statiticinis patriarchs will laugh prophets to scorn but the despised populace will safely course their way under the arch of the bridge and above the curve of its foundation. Posterity will always be fond of choruses which are denied to present cars."

## MEDICAL PROGRESS

Measles Prophylaxis with Serum of Adults Who Had Measles in Childhood.—John D. Van Cleve describes the results obtained in a series of cases of measles in which 15 c. c. of parent serum were administered at different periods in the course of the disease. An analysis of these cases shows that the controls all had rather marked symptoms, the temperature running high and lasting five days or more, and the rash, rather large and profuse, lasting six days or The temperature usually existed three or four days before the rash appeared, but the rash persisted and was at its height when the fever was highest, and lasted about two days after the disappearance of the fever. In the cases modified by adult serum, the incubation period was lengthened, and fever and rash appeared almost together and lasted three days or The percentage of complications in the controls was rather large, while in the modified there were no complications. Since 15 c.c. were used regardless of age, it seems that the tendency for full protection was in the very young, or those under four years of age. It also seems that the amount of antibody differs considerably in different adults. A comparison of the author's results with those obtained by others with convalescent measles serum, immune measles serum, and antistreptococcus measles serum, shows that the serum of adults who had had measles in childhood is less efficacious, even if the dosage is doubled. However, where other sera are not to be had it will answer well to protect the young and malnourished, and will modify the disease in older patients without fear of complications. In the older children and adults it would seem better to employ a method that will modify the disease, as it has been shown by others that serum protects for only four to six weeks, while the modified cases have a lasting immunity that is indefinite.-Archives of Pediatrics, February, 1930, xlvii, 2.

Paroxysmal Ventricular Tachycardia.—Maurice B. Strauss presents an analysis of 63 cases of paroxysmal tachycardia found in the literature, to which he adds two cases of his own. In 60 per cent. of the cases the condition occurred in the fifth and sixth decades of life. Slightly over two-thirds of the patients were males. In 11 cases there was no clinical or laboratory evidence of cardiac pathology other than the rapid pulse, while in the others various types of organic heart disease were present. Digitalis had been administered before the onset of the tachycardia in 50 per cent. of the cases; in

some the dosage was excessive, while in others it was too small to produce any effect. number of the cases withdrawal of the digitalis was followed by cessation of the tachycardia, while its subsequent use resulted in a return of the rapid rate, indicating that in organic heart disease tachyrhythmia may be one of the toxic manifestations of digitalis. Paroxysmal tachycardia should be suspected whenever a rapid. almost completely regular, rate supervenes in a case of long-standing heart disease, particularly if large doses of digitalis have been used. Levine has noted, on auscultation, a slight irregularity in tachycardia of ventricular origin not to be found in other forms, and also the quality of the first heart sound may perceptibly vary in different cycles. Vagal stimulation and ocular pressure are never effective in terminating this type of tachycardia, thereby offering a differential criterion. Positive diagnosis, however, can only be made by means of the electro-cardiograph. The only successful remedy is quinidine, usually the sulphate, used in doses as high as 7.5 grams a day, although maintenance of rhythm has sometimes been possible on 0.2 gram per day. Of the 11 patients showing no pathology, all were living at the time of writing. Of 50 patients with organic heart damage four-fifths died in from three to six months from the onset of the tachy-Of 16 cases in which quinidine was used only 3 terminated fatally. - American Journal of the Medical Sciences, March, 1930, clxxix, 3.

Therapeutic Fever Produced by Diathermy with Special Reference to Its Application in the Treatment of Paresis.—J. Cash King and Edwin W. Cocke have endeavored to duplicate by diathermy the typical temperature curve of double tertian malarial fever. They raise the temperature to the usual height reached in malaria (about 6 degrees above normal) and then permit it to return to normal, repeating the procedure for eight to twelve days. A high frequency generator is used which is especially constructed to withstand long-continued operation under heavier loads (3500 milliamperes) than those ordinarily used. In order to get sufficient electrode surface to pass the current through the body without producing burns a special jacket is worn holding a 7 by 9 inch tinfoil electrode on the front and back of the chest and abdomen. The patient is wrapped in blankets and rubber sheets to prevent excess heat dissipation and to care for the great amount of perspiration. The current is started at zero and allowed to reach its maximum Volume 30 Number 8

in twenty to thirty minutes. The pulse, respiratory rate, and temperature by mouth, rectum, and arm are recorded every fifteen minutes. As the discomfort is great the patient is given some opiate after having been under treatment for an hour or so; hyoscine, morphine, and cactine gave the most satisfactory combination. Of 20 patients who have received this treatment only 12 have taken a satisfactory series. Of these 8 show definite improvement after periods of from two to ten months, while 11 show a gain in weight and improvement in their general well-being. This method of elevating the temperature avoids many of the dangers and disadvantages inherent in malarial therapy and the use of foreign proteins. The reactions are very similar to those produced by disease. Diathermy is always available. The frequency, duration, and intensity of the febrile paroxysms are under accurate control. therapy can be used in conjunction with this type of pyretotherapy. The method is applicable to other conditions in which fever therapy has shown favorable results. - Southern Medical Journal, March, 1930, xxiii, 3.

The Problem of Rheumatism So-Called .-Prof. A. Böttner, internist of Königsberg, although he writes at great length on this condition in both its acute and chronic expressions, gives but little space to focal infection as a causal factor. In place of this he discusses a special oversensitiveness of the tissues which may stand in some relation to bacterial toxins, an enterogenous origin, a factor associated with the endocrine system, and other possibilities, including diet. As for speciic bacterial causes it is true that many of these organisms when they are pathogenic to mankind incidentally cause rheumatoid symptoms-"every infection has its rheumatism." It is difficult to isolate an essential rheumatism from these symptomatic forms. Like most of his countrymen the author is not convinced by the claims of the focal infectionists, for the reason that in none of these patients do we have any objective finds in the shape of temperature rise, change in blood counts, etc. Only in cases with pronounced objective finds would be order removal of the tonsils, extraction of teeth, etc. purely for the removal of alleged foci. If the latter are really a menace the average man must have some immunity against infection through the blood-some natural immunity which does not need to develop a leucocytosis. As we know so little of causal factors there is little to be said under scientific prophylaxis and cure. One might test some kind of desensibilization. Some have tested old tuberculin, collargol, and the like with apparent benefit. Treatment directed to intestinal autointoxication also seems to give good results and some patients may benefit from endocrines if there is any evidence of

deficiency. Not much is said of special dietetics, but the author would pay great attention to healthy digestive functions. Aside from the preceding we have palliatives in the form of drugs of the pyramidon type, and the usual resources of physiotherapy. - Klinische Wochenschrift, February 15, 1930.

The Physical Therapy Treatment of Athletic Injuries .- J. C. Elsom emphasizes the value of physiotherapeutic measures in all types of athletic injuries, but insists that they should be applied skilfully and intelligently, and always under medical supervision. The most common athletic injury is that commonly called "charley horse," which is usually a deep contusion caused by a succession of blows and manifested by great sensitiveness, swelling, and interference with proper movement of the joint which the injured muscles operate. In the treatment the most logical application is heat, or heat and cold alternately. Radiant heat and light applied for half to threequarters of an hour gives relief and expedites healing. Massage is valuable, but should be applied very carefully and gently; deep and rough massage is distinctly injurious. Diathermy employed with the mild current long continued is valuable, especially in chronic cases, but in severe cases it should be employed cautiously, and never in cases of recent hematoma. Another common athletic injury, referred to as "shin splint," is really a severe myositis, affecting the peroneal and tibial group as well as the deep fascia in the region. The treatment consists in immediate rest with prolonged application of infra-red, radiant heat and light, or hydrotherapy, especially the whirlpool bath, combined with effleurage, and diathermy after the more acute symptoms have subsided. Sprains should receive immediate attention. The prompt application of ice-water or ice-packs tends to reduce the swelling and extravasation of blood. Complete rest for a period varying with the severity of the injury is advisable. When the acute symptoms have passed (in a few hours, for example) hot packs, the whirlpool bath, and dathermy are beneficial. Massage, except very slight petrissage, should not be applied at first, but is useful later. Moderate exercise should be begun early. Diathermy is of undoubted value, and static electricity is strongly advised by those equipped to use it. The treatment of "tackle shoulder" does not differ essentially from that of other varieties of sprain. -Physical Therapeutics, March 1930, xlviii, 3.

Causes and Significance of Post-Operative Acidosis.—E. Raab and F. Wittenbeck of the University Gynecological Clinic at Halle sum up this subject as follows: In some cases acidosis is due to damage to the liver as a result of inhalation narcosis, but mere operative shock can

also cause it—as shown in lumbar anesthesia through action on the splanchnic nerves and adrenals. Another factor is the psychic alteration in the patient before the operation. Acidosis may also result from the action of the narcotic on the respiratory center which leads to an accumulation of carbon dioxide. This corresponds to the effect of hyperventilation or forced respiration which eliminates an excess of the gas and at times may end in an alkalosis. In such cases we have a paradoxical status, for despite this alkalosis the ketone bodies in the blood are increased. Another factor which must not be forgotten is the fasting before operation with the tendency to To evaluate each of these inanition-acidosis. factors in a given case is a complicated task and the authors have tested fasting acidosis in a series of 30 patients, all of whom were made to fast for 2 days and received laxatives and a little broth only before operation. A ketonemia developed with increase in the percentage of blood The conclusion was reached that it is unwise to prepare patients for operation by fasting and laxatives, although no actual untoward results are mentioned. In regard to the practice of giving injections of glucose and insulin to oppose acidosis, both these substances being credited with an antiketogenic action, the authors object to them as useless even if the glycogenic action of the liver has been impaired by the anesthetic. The same skepticism extends to the use of sodium bicarbonate. As a matter of fact they do not regard post-operative acidosis as a pathological or serious clinical condition at all. In over 100 cases of it they have seen no serious consequences and their final conclusion is that prevention and treatment are not indicated.—Klinische Wochenschrift. February 8, 1930.

Determination of Sex.—Prof. F. Unterberger begins his article on this subject with a citation of the vast amount of work which has been carried out in the attempt to determine the optimum for the procreation of male heirs. This mass effort has mostly been barren of result but today we are receiving some indirect aid from the zoologists, with special reference to the chromosome content of sperm and germ cells. seems little doubt that the rsponsibility for the procreation of male children lies with the father. for we may speak of male and female spermatozoids, which are usually equally represented in numbers. But the author has always been interested in the possibility that the woman may also play a determining role. In a combat against sterility the author has had an opportunity of doing some original research in procreation. veterinary practice the mere injection of alkali into the vagina has caused barren cows to conceive and the author naturally tested this resource

in the human, with the added reason that the vaginal secretions of sterile women in a special series of cases were strongly acid. Not only did a number of sterile women conceive but each bore a male child. In 53 cases within the space of 10 or 12 years he has a record of 53 boys which is 100 per cent. of the total. He would have been satisfied with a total of 90 per cent. The conclusion seems inevitable that acid vaginal secretions are without influence on procreation while an alkaline secretion can at least paralyze the female spermatozoids if not destroy them. This of course seems an absurdly simple solution of what has always been regarded as a highly complicated situation, but the author is a reputable man at the head of a gynecological clinic in Königsberg.-Deutsche medizinische Wochenschrift, February 21, 1930.

Treatment of Pylorospasm in the Nursling.— Professor C. Ramstedt, who in 1912 described the operation since known by his name for pylorospasm (pyloromyomotomy) now sums up the results of his subsequent experience in this province. He does not understand why the method should not have met with more favor and has sent a questionnaire to sixty clinics or asylums where nurslings are treated. The total number of cases was at the last reckoning 1842, of which 497 has been treated by operation and 1345 medically. Mortality in the surgical series was 22.5 per cent, while in the medical series it was but 16 per cent, which readily explains why the surgical resource has not come into more general vogue. In both series the cause of death showed much variety and little is to be learned from an analysis. In some series of cases authors have obtained 100 per cent cure from internal treatment, but this is quite exceptional. For that matter Kirschner operated on 43 nurslings with but one death, and others have secured equally good results. A table compiled from the surgical clinics which do the greatest amount of work shows a death rate in 562 cases of but 7 per cent. The author is confident that this operation when properly carried out, and seasonably, will reduce materially the 16 per cent mortality which inheres in the medical management. The author himself has lost but 2 out of 60 patients operated on, while Heile, of Wiesbaden, lost but 3 in 92 cases. But one American clinic is quoted, the Mayo Foundation, where there was 1 death in 48 operations. No mention is made of the work of Downs and Bolling of New York, in any connection, although they have had a vast experience, we believe. The author styles his operation the Weber-Ramstedt, while American surgeons usually speak of it simply as the Ramstedt or Fredet-Ramstedt .- Deutsche medizinische Wochenschrift, February 28, 1930.

Treatment of Tuberculosis with Choline is, of course, a bare possibility that the nurse's Chlorhydrate—J Carles and F Leuret be- disease was really an influenza-pneumonia, but lieve that susceptibility to tuberculosis stands in a definite relationship to a certain chemical state of the blood which is in effect the relationship of glycemia to cholesterinemia. This opinion is based on 100 examinations of patients and experiment animals. When tuberculosis takes on an active and severe type cholesterol in the blood shows a weakening. On the other hand if the glycemia is normal and the blood cholesterol elevated there is a tendency to spontaneous recov-In order to test their views out in practice the authors have been giving patients cholesterol by the mouth or injection and incidentally have made subcutaneous injections of the chlorhydrate of choline with the same end in view, since this substance is known to increase blood cholesterol without at all affecting the glycemia hardly be said that this substance has any notable physiological action, but in the tuberculous subject, even in advanced cases of open tuberculosis, the results are often startling and contrary to all expectation. The temperature slowly falls to normal, cough abates, appetite returns, anemia regresses, etc. Similar results are seen also in external tuberculosis Subjectively the patients are euphoric Thus far the authors claim clinical cu e of 8 out of 32 cases treated, 2 being examples of severe open tuberculosis, cured without sanatorium sojourn In addition there were 10 cases of unexpected improvement, so that the total benefited is about 30 per cent. The authors will publish this series of cases in full, and can recommend their method for the additional reason that it can do no injury to the patient. They do not allude to the possibility that the action of this remedy ought to be heightened by dietetic and sanatorium resources -Bulletin de l'Acade mie de Medecine, February 18 1930

Psittacosis and Grippe - Parrot disease had never visited the City of Munich until the present day visitation of Germany, during which some 7 cases have been recorded there with two deaths The cases are reported clinically by Kerschensteiner, while S Oberndorfer studied the two fatalities post mortem Both of these men reached the same conclusion that there is an extremely close analogy between parrot disease and influenza. It is not claimed that there is any identity, although it seems evident that both discuses are propagated by an invisible virus and that both unknown organisms have common path ological properties. In the clinic it might be impossible to discriminate between parrot disease and influenza pneumonia owing to the resemblance between the symptoms, fever curves, etc Contagion from person to person was shown, as one of the 7 patients was a nurse who had waited on different members of the afflicted family to which all the other six patients belonged. There

the chances are small of such a coincidence Autopsy finds in the two victims agreed both macrosopically and microscopically with those of the severest types of influenza pneumonia the first case in fact, when the diagnosis of par rot fever had not yet been made, Oberndorfer did actually turn in that diagnosis. It is of much interest to note that in the second case the bacteriologist found Pfeiffer's influenza bacillus in almost pure culture in smears from the chest This fact suggests that the latter organism may be a secondary invader in several acute infections Another feature common to both seems to be a peculiar metaplasia of the epithelium of the finer bronchioles which is also the first step in carcinoma of the bronchi, an affection which is beheved to be increasing -- Munchener medizin ische Wochenschrift, February 21 1930

Fatal Case of Exophthalmic Goiter Commenced During Thyroid Administration -Eggert Moller reports the case of a woman, 49 years of age, with exophthalmic goiter, which began after she had for a few weeks been taking moderate doses of thyroid gland tablets in order to reduce her weight. Although the medication was stopped immediately the disease progressed and in six months terminated fatally nosis was confirmed at autopsy. A lumbar puncture performed two days before the death of the patient revealed an increased albumin and globulin content of the spinal fluid. The number of cells was normal. The increased protein content was found at a time when very definite psychical disturbances were present. No references concerning the composition of the spinal fluid in exoplithalmis goiter have been found in the literature. While it cannot be stated decisively that the disease was brought about by the previous thyroid gland medication, in view of the fact that seven or eight similar cases have been reported, it seems probable that such was The relatively small number of cases, however, emphasizes the rôle of predisposition. which in rare cases may precipitate the development of an exophthalmic goiter, that in the absence of thyroid medication might not have manifested itself at all Moller advances the theory that the thyroid medication started an abnormal function of the sympathetic and parasympathetic system, which in turn stimulated the thyroid gland and in this way a vicious circle was brought into action. The practical importance of the case consists in a memento of the grave dangers incurred by the indiscriminate use of thyroid medication. The indications for this treatment should be drawn very narrowly and practically restricted to cases of hypothyroidism -Acta Medica Scandinavica Tebruary 28 1930, 1xxiii 1

## LEGAL

## "BOOTLEG INSURANCE" ATTACKED BY THE NEW YORK SUPERINTENDENT OF INSURANCE

By LORENZ J. BROSNAN, ESQ. Counsel, Medical Society of the State of New York.

In our issue of August 15, 1928, we published an editorial entitled "Bootleg Insurance." In this editorial we referred to an article appearing in the New York Tribune of July 5, 1928, which contained an account of the warning issued by Howard P. Dunham, Superintendent of Insurance of the State of Connecticut against doing business with companies unauthorized to transact insurance business in that state. In that editorial we likewise took occasion to quote from Section 1199 of the New York Penal Law, which is as follows:

"Any person acting for himself or for others, who solicits or procures, or aids in the solicitation or procurement of policies or certificates of insurance from, or adjusts losses or in any manner aids the transaction of any business for, any foreign insurance corporation, which has not executed and filed in the office of the superintendent of insurance, a written appointment of the superintendent to be the true and lawful attorney of such corporation in and for this state, upon whom all lawful process in any action or proceeding against the corporation may be served, is guilty of a misdemeanor."

The New York authorities have now issued a similar warning in the *Journal of Commerce* for Friday, February 21, 1930, as follows:

"Several days ago it was called to the attention of Albert Conway, Superintendent of Insurance of the State of New York, that the Union Mutual Life Co., of Des Moines, Iowa, a company not admitted to do business in the State of New York, had been soliciting insurance by means of radio programs over Station WOV, 16 East Forty-second Street, New York City. Mr. Conway immediately delegated one of his deputies to institute an investigation in the matter. An interview was had with John Iraci, president of Station WOV, which resulted in immediate cancellation of the station's contract with the Union Mutual Life Co. which had one year to run, and the cancellation of the programs that were scheduled for Tuesday, February 18, the day the investigation was commenced.

"Mr. Conway desires to warn the people of the State of New York against dealing in any manner with companies that have not been admitted to do business in this State. If they are solicited for insurance either directly, by mail or by means of radio programs, and they are not certain whether or not the company making such solicitation is licensed in the State of New York, he invites them to make immediate inquiry either to the New York office of the State Insurance Department at 111 John Street, or at the Albany office of the department at Albany, N. Y."

It is thus seen that the New York Superintendent of Insurance has issued a timely warning to the people of our state against dealing in any manner with companies which have not been authorized to transact insurance business in our state.

This warning should be heeded by the members of the medical profession who, through the mails and in various publications have been solicited to take out policies in companies not authorized to do business here.

The insurance carrier under our group plan is a Connecticut corporation, fully authorized in every way to do business in New York. It has met every requirement of our New York statutes. In this connection, we quote again the paragraph with which we closed our former editorial:

"The success of our Group Plan is now too well appreciated and understood to require further comment. Yet occasionally, it has happened that some isolated member of our Society has seen fit to insure himself elsewhere. This, of course, is his privilege. But we deem it our duty to convey the warning that coverage taken in a foreign corporation not authorized to do business in this State, may leave the physician in an unfavorable position in the event of a difference between him and the foreign company in which he has been prevailed to insure himself. A foreign corporation not authorized to do business in this State, is not under the jurisdiction and supervision of our New York Insurance Department. In the event of a failure on the part of such a company to meet its obligations, it cannot be sued in the courts of this State."

#### CLAIMED NEGLIGENCE IN SETTING OF COMPOUND FRACTURE OF FINGER

In this case the plaintiff called upon the defendant physician with a history of an injury to one of plaintiff's fingers. An examination revealed a lacerated finger with a compound fracture. The wounds were thoroughly cleaned and antiseptic dressings applied.

The patient was then instructed to procure x-rays of the finger, which x-rays were examined by the defendant physician on the following day and prior to his further examination and treatment of the patient. The x-rays confirmed the previous diagnosis of a compound fracture.

The patient was taken to a hospital that afternoon, where the laceration was widened and a thorough exploration of the wound made. This further examination indicated that it was impossible to hold the fragments in apposition without the application of traction, which was impossible in view of the fact that there was very little uninjured tissue at the tip of the finger ayailable for the application of traction. A consultation was had, and the patient's representative advised that an attempt to save the finger would be made, since an amputation could easily and readily be performed at a later date in the event

that the bones did not properly set and the condition did not turn out satisfactorily. This procedure was agreed upon, and the bones were placed in as good position as possible, and splint and dressings were applied. The patient was kept in bed for about one week, the wound being dressed daily.

Thereafter the finger was treated with solutions of boric acid, the physician continuing in attendance for approximately six weeks, when the patient discontinued calling at the defendant physician's office for further examination and

treatment.

The complaint in the action charged that as a result of the defendant's claimed negligence, the bones of the plaintiff's broken finger were caused to override, causing the finger to become deformed. In view of the consultation had with the plaintiff's representative at the time the procedure of setting the bones instead of an immediate amputation was decided upon, the plaintiff was unable to sustain his contention of negligence on the part of the physician and accordingly discontinued the action, thereby terminating it in the doctor's favor without trial.

#### CLAIMED NEGLIGENCE IN TREATING SCARS WITH NITRIC ACID

In this case the plaintiff, a man, colored, about thirty years of age, consulted the defendant for the purpose of obliterating or rendering less prominent certain scars on his face. These scars had the appearance of claw-marks, which the plaintiff advised the doctor were received in an altercation with a woman. The doctor attempted to better the appearance of the scars by the application of a twenty-five percent solution of nitric acid, applying the nitric acid with cotton swab to such portions of the scars which showed through the black pigment.

The patient returned for two similar treatments, each a week apart, on which occasions the same treatment was rendered. At the conclusion of the third treatment the doctor, noting that the condition was not improving, advised the patient that further treatments would be ineffectual. The

patient who was also being treated for an injury to his hand received in the course of his employment, asked the doctor to make a report that the patient was not yet in a condition to return to his work. Upon the doctor's refusal to make such a false report, an action in malpractice in connection with the treatment of the scars was commenced.

In this action the plaintiff contended that as a result of the application of the medications, the areas treated became darker in hue, thereby causing a blotchy appearance. Prior to the time that this case came on for trial, a physical examination revealed that there were no discolorations due to the application of chemicals. As a result the plaintiff's attorney discontinued the action, thus terminating the proceeding in the doctor's favor without trial.

## THE ANNUAL MEETING

#### PROGRAM OF THE SCIENTIFIC MEETING

The scientific program of the one hundred and twenty-fourth annual meeting of the Medical Society of the State of New York, has been completed and is now published for the benefit of the

The mornings of Tuesday and members. Wednesday, June 3 and 4, will be given over to the eight scientific sections of the Society, and each afternoon to a general session.

#### THE COMMITTEE ON SCIENTIFIC WORK:

Chairman, Arthur J. Bedell, M.D., Albany

Gordon Gibson, M.D., Brooklyn Abraham H. Aaron, M.D., Buffalo William D. Johnson, M.D., Batavia George M. Gelser, M.D., Rochester

Edwin S. Maynard, M.D., Rochester James S. Walker, M.D., Amsterdam James H. Huddleston, M.D., New York Walter J. Highman, M.D., New York

John Aikman, M.D., Rochester

#### GENERAL SESSIONS

Tuesday, June 3rd, 2:30 P. M.

"Medicine Under Siege," an address by Malcolm L. Harris, M. D., President of the American Medical Association, Chicago, Illinois (By invitation.)

#### SYMPOSIUM ON BIRTH INJURIES

1. "The Relation Between Obstetrical Procedures and the Later Disability of Children," Bronson Crothers, M.D., Boston, Mass. invitation.)

2. "The Obstetrical Problems," John O. Polak,

M. D., Brooklyn.

Discussion opened by George W. Kosmak, M. D., New York City.

3. "The Ocular Symptoms," Max Jacobs,

M. D., St. Louis, Mo. (By invitation.)

4. "The Orthopedic Manifestations," Armitage Whitman, M. D., New York City.

Wednesday, June 4th, 2:30 P. M.

#### SYMPOSIUM ON METABOLIC DISTURBANCES

1. "The Role of the Thyroid in Metabolic Disturbances," Nellis B. Foster, M. D., New York

2. "Surgery of the Thyroid Gland in Metabolic Disturbances," George W. Crile, M. D., Cleveland, Ohio. (By invitation.)

3. "Recent Work in Experimental Rickets,"

Arthur J. Knudson, Ph.D., Albany. (By invitation.)

4. "Dermatology in Relation to Metabolic Disturbances," Walter J. Highman, M. D., New York City.

Discussion opened by Howard Fox, M. D.,

New York City.

#### SECTION ON MEDICINE

Secretary......John Wyckoff, M.D., New York City

Tuesday, June 3rd, 10:30 A. M.

1. "Can This Heart Stand an Operation," Samuel A. Levine, M. D., Boston, Mass. (By invitation).

Discussion opened by Nelson G. Russell, M. D., Buffalo.

- 2. "The Relation of Gastric Secretion and Blood Condition to Biliary Tract Disease," John A. Lichty, M. D., Clifton Springs.
- 3. "Artificial Pneumothorax versus Phrenectomy in the Treatment of Pulmonary Tubercu-

losis," Herbert F. Gammons, M. D., Lockport, and Arthur N. Aitken, M. D., Lockport.

Wednesday, June 4th, 9:30 A. M.

1 "Conception of Pernicious Anemia," George H. Whipple, M. D., Rochester, (By invitation).

2. "Recent Advances in the Diagnosis and Treatment of Pernicious Anemia, William B. Castle, M. D., Boston. (By invitation.)

3. "Results of the Liver Treatment in Pernicious Anemia," Joseph E. Connery, M. D., New York City.

#### SECTION ON SURGERY

Chairman. William D. Johnson, M.D., Batavia Secretary. Charles W. Webb, M.D., Clifton Springs

Tuesday, June 3rd, 10:30 A. M.

SURGERY OF THE HANDICAPPED PATIENT

- 1. "Pulmonary Complications," Edgar W. Phillips, M. D., Rochester.
- 2. "Choice of an Anesthetic," W. J. Merle Scott, M. D., Rochester.
- 3. "The Treatment of Infections," Henry Martin, M. D., Warsaw.

Discussion opened by Grant C. Madill, M.D., Ogdensburg, Edwin M. Stanton, MD, Schenectady, Howard L Prince, M.D., Rochester, William R. Thomson MD., Warsaw.

Wednesday, June 4th, 9:30 A. M.

1. "Are there Indications for Adrenalectomy," George W. Crile, M. D., Cleveland, Ohio (By invitation.)

Discussion opened by Arthur S. Chittenden, M. D., Binghamton.

2. "Oesophageal Diverticula and Their Surgical Treatment," Frank H. Lahey, M. D., Boston, Mass. (By invitation.)

Discussion opened by George W. Cottis, M. D.,

Jamestown.

3. "The Use of the Radio Knife in Renal Surgery," Winfield W. Scott, M. D., Rochester. Discussion opened by Martin B. Tinker, M. D.,

#### SECTION ON OBSTETRICS AND GYNECOLOGY

Tuesday, June 3rd, 10:30 A. M.

1. "Controllable Spinal Anesthesia," Frank A. Kelly, M. D., Detroit, Mich. (By invitation.)

Discussion opened by ........ 2. "End Results in Eclampsia," Alfred C.

Beck, M. D., Brooklyn. Discussion opened by ......

3. "Secondary Sterility Following Induced Abortion," Isidor C. Rubin, M. D., New York

Discussion opened by ......

4. "Practical Conclusions Drawn from One Thousand Forceps Deliveries," Henricus J. Stander, M. D., Baltimore, Md. (By invitation.)

Wednesday, June 4th, 9:30 A. M.

1. "The Incidence of Post-Partum Hemorrhage at Brooklyn Hospital," William S. Smith, M. D., Brooklyn.

Discussion opened by ......

2. "Application of Diathermy in Gynecology," Thomas H. Cherry, M. D., New York City. Discussion opened by ......

3. "Title to be announced," J. R. Goodall, M. D., Montreal, Canada. (By invitation.) Discussion opened by ......

#### SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman......James S. Walton, M.D., Amsterdam 

Tuesday, June 3rd, 10:30 A. M.

1. "X-ray Discovery of Tuberculosis in apparently well people," Haynes H. Fellows, M. D., New York City.

Discussion opened by Ezra Bridge, M. D., Rochester.

2. "The Health Officer's Duty in Tuberculosis Control," Robert E. Plunkett, M. D.,

Discussion opened by Ezra Bridge, M. D.,

3. "First Impressions of Public Health Work in New York State," Thomas Parran, Jr., M. D., Albany, (By invitation.)

4. "Milk Control Problems," Paul B. Brooks, M. D., Albany.

Discussion opened by Emmett R. Gauhn, D. V. M., Rochester. (By invitation.)

Wednesday, June 4th, 9:30 A. M.

1. "Undulant Fever," Byron E. Chapman, M. D., Broadalbin.

Discussion opened by G. Scott Towne, M. D.,

Saratoga Springs. 2. "Cooperation in Public Health Work by School Authorities," E. Harrison Ormsby, M. D.,

Amsterdam. 3. "Periodic Health Examinations," C. Ward Crampton, M. D., New York City.

#### SECTION ON PEDIATRICS

Tuesday, June 3rd, 10:30 A. M.

- 1. Chairman's Address, John Aikman, M. D., Rochester.
- 2. "The Relation of Infection to Nutrition in Infancy," Samuel W. Clausen, M. D., Rochester.

Discussion opened by Adolph G. DeSanctis, M. D., New York City.

3. "The Prognosis of Blood Stream Infection in Children," Roger H. Dennett, M. D., New York City.

Discussion opened by Albert D. Kaiser, M. D., Rochester.

4. "The Clinical Significance of Abdominal Pain in Children," Edward J. Wynkoop, M. D., Syracuse.

Discussion opened by Douglas P. Arnold, M. D., Buffalo.

Wednesday, June 4th, 9:30 A. M.

1. "Fulminating Meningococcus Meningitis in Infancy and early Childhood," Stafford McLean. M. D., New York City, and John Caffey, M. D., New York City.

2. "The Influence of Diet upon Infant Mor-

tality," Harry R. Lohnes, M. D., Buffalo.

Discussion opened by Frank vander Bogert,

M. D., Schenectady.

3. "Icterus Neonatorum, The Oxygen Content of the Maternal and Fetal Blood," Alton Goldbloom, M. D., and Rudolph Gottlieb, M. D., Montreal (by invitation).

Discussion opened by Marshall C. Pease, M. D., New York City.

4. "Problems in Child Guidance," Eric Kent

Clarke, M. D., Rochester.

Discussion opened by Ira S. Wile, M. D., New York City.

#### SECTION ON NEUROLOGY AND PSYCHIATRY

Tuesday, June 3rd, 10:30 A. M.

1. "Peripheral Nerve Injuries, Their Treatment and Compensation Aspects," William P. Van Wagenen, M. D., Rochester.

Discussion opened by Martin B. Tinker, Ithaca.

2. "Experiences in the Treatment of Multiple Sclerosis with Quinine," Richard M. Brickner, M. D., New York City.

Discussion opened by Edward L. Hanes, M. D., Rochester.

3. "The Fractured Skull," Wardner D. Ayer, M. D., Syracuse.

Discussion opened by Clement B. Masson, M. D., New York City.

4. "General Hospital Neuropsychiatry," G. Kirby Collier, M. D., Rochester.

Discussion opened by Eugene N. Boudreau, M. D., Syracuse.

5. "The Treatment of Schizophrenia by Inhalations of Carbon Dioxide," Harry C. Solomon, M. D., Boston, Mass. (By invitation.)

Discussion opened by Israel S. Wechsler, M.

D., New York City.

#### , Wednesday, June 4th, 9:30 A. M.

1. "The Anatomic Basis of Personality," Irving J. Sands, M. D., Brooklyn.

2. "Clinical Methods in the Prevention of Psychoses," Gregory Zilboorg, M. D., White Plains, and Gerald R. Jameison, M. D., White Plains.

3. "The Prevention of Nervous Disorders: A Community Program," Albert B. Siewers, M. D.,

4. "Child Guidance and Mental Health," Law-

son G. Lowrey, M. D., New York City.

Discussion opened by Sanger Brown, 2nd, M. D., Albany; Herbert N. Vermilye, M. D., Forest Hills; Harold I. Gosline, M. D., Ossining.

#### SECTION ON EYE, EAR, NOSE AND THROAT

Tuesday, June 3rd, 10:30 A. M.

1. "Vagaries and Mistakes in Ophthalmic Practice," Frank Barber, M. D., Rochester.

Discussion opened by Webb W. Weeks, M. D.,

New York City.

2. "Angiomatosis Retinae"—Illustrated with Stereoscopic Photographs, Arthur J. Bedell, M. D., Albany.

Discussed by John F. Gipner, M.D., Rocheser, and Thomas H. Johnson, M. D., New York City.

3. "Types of Ocular Complications in Paranasal Sinus Disease," Luther C. Peter, M. D., Philadelphia, Pa. (By invitation.)

Discussion opened by Chester C. Cott, M. D., Buffalo.

4 "Recent Advances in Ophthalmic Therapeutics," Harry S Gradle, M D, Chicago, Ill (By invitation)

Discussion opened by Ray R Losey, M D, New York City

Wednesday, June 4th, 9 30 A M

1 "Some of the Uses of Endothermy in the Treatment of the Ear, Nose, and Throat," Lee M Hurd, M D, New York City

Discussion opened by John McCoy, M D,

New York City

2 "Management of Chronic Sinus Disease," William V Mullin, M D, Cleveland, Ohio, (By invitation)

Discussion opened by Richard T Atkins, M D New York City

3 "Observations in Vocal Cord Paralysis," Roy A Barlow, M D, Rochester

Discussion opened by Rov S Moore, M D, Syracuse

4 "Bronchoscopy as an Aid in the Diagnosis and Treatment of Diseases of the Lung Lantern Slide and Moving Picture Demonstration" Chevalier Jackson, M. D., Philadelphia, Pa. (By nvittion)

Discussion opened by Herrmann E Bozer MD, Buffalo

#### SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman Secretary

Tuesday, June 3rd, 10 30 A M

1 "X-rays, General Use in Dermatoses" George M MacKee, M D, New York City 2 "X ray and Radium in the Treatment of Malignant Neoplasms of the Skin,' Joseph J

Eller, M D, New York City
Discussion opened by Mark Heiman, M D,

Syracuse

3 "A Comparison of The Roentgen Ray with Other Forms of Radiant Therapy in Treating Skin Discress," Herbert H Bruckus, M D, Ruffalo

Discussion opened by Clarence H Peachey, M D, Rochester, and George M Fisher, M D, Utica

4 "The Use of Radium in Dermatology,' William H. Cameron, M. D. New York City

ham H Cameron, M D, New York City
Discussion opened by Howard Fox M. D,
New York City

Wednesday, June 4th, 9 30 A M
1 "Late Results in Cases Treated with Bis

Walter J. Highman, M.D. New York City Albert R. McFarland, M.D. Rochester

marsen," Paul A O Leary, M D, Rochester Minn (By invitation)

Discussion opened by Edward R Maloney, M
D New York City

2 "An Evaluation of the Newer Methods of Treating Syphilis," Mihran B Parounagian, M D. New York City

Discussion opened by Paul E Bechet, M D, New York City, and Harry C Saunders, M D, New York City

3 'Visceral Manifestations of Syphilis," George Bachr, M D New York City

Discussion opened by William S McCann, M D, Rochester

4 "Congenital Syphilis, Its Manifestations and Treatment," Earl D Osborne, M D, Buffalo Discussion opened by George C Andrews, M

D, New York City

5 "Antimony in the Treatment of Leprosy," Jerome Kingsbury, M. D., New York City Discussion opened by . . .

#### SESSION ON PHYSICAL THERAPY

Chairman

Wednesday, June 4th, 9 30 A M

1 "Physical Therapy for the General Practitioner," Clarence E Anderson, M D, Llinira Discussion opened by Guy H Turrell, M D, Smithtown Branch

2 "Medical Diathermy," Richard Kovacs, M. D., New York City

Discussion opened by Frederick deKrift, M. D. New York City

Richard Kovaes, M D, New York City

3 "Physical Therapy in Compensation Work,"
Homer J Knickerbocker, M D, Geneva

Discussion opened by Lee A Hadley, M D Syracuse

4 "Light Therapy Its Uses and Abuses," Frank T Woodbury, M D, New York City

Discussion opened by Ezra Bridge, M D Rochester

MEETING PLACES
OF THE SCIENTIFIC
SESSIONS

ANNUAL MEETING, MEDICAL SOCIETY STATE OF NEW YORK

HOTEL SENECA, ROCHESTER, N.Y. JUNE 2, 3 and 4

#### THE TECHNICAL EXHIBIT AT THE ANNUAL MEETING

An exhibit of medical wares will be held in connection with the Annual Meeting of the Medical Society of the State of New York on June 2-4, 1930, in Rochester. All features of the meeting will be centralized to an unusual degree in the Hotel Seneca where the House of Delegates will meet and the Registration desk will be located, and the scientific sessions will be held.

The technical exhibit will also be located in the Hotel Seneca on the mezzanine and second floors, as is shown in the diagram on page 462. The exhibit will be easy of access, and will afford diversion and profit to physicians attending the sessions, or waiting to meet their friends.

Every physician has a few favorite commercial houses with which he deals, but the exhibit will afford him the opportunity to enlarge his circle of acquaintances, as well as to broaden his knowledge of the newer procedures and instruments.

#### DESCRIPTIONS OF THE TECHNICAL EXHIBIT

Booth 27—Bausch & Lomb Optical Company, Rochester, N. Y. Of special interest at the Bausch Lomb Optical Company's exhibit in Booth No. 27, will be their New Research Binocular Microscope, an instrument of construction so greatly out of the ordinary that the word "New" can be used in the fullest sense of the word.

A New Research Microscope Lamp will be used in conjunction with the New Microscope. This lamp meets two requirements which few lamps satisfy; the one of utilizing the full aperture of the microscope condenser (up to N.A. 1.40) and the other of transmitting sufficient light to make possible critical illumination of the specimen under observation.

Also, other scientific instruments useful in clinical diagnosis and laboratory practice will be exhibits including the latest models of Microscopes, Microtomes, Haemacytometers, Hemoglobinometers, Exton Scopometer, Jr., Photomicrographic Cameras and Colorimeters.

Booth 6-The BiSoDol Company, New Haven, Connecticut. First Aid for the Stomach should be given by an agent that, while it relieves, does not harm. In sour stomach, acid eructations, and the like, the phenomenal success of BiSoDol, is due to the fact that it is a balanced antacid which physiologically controls hyperacidity. The combined action of magnesium carbonate with sodium bicarbonate and bismuth subnitrate automatically prevents alkalinization at the same time that it corrects hyperacidity. BiSoDol is a safe, speedy and effective remedy in all stomach conditions due to excess of acid or derangement of acid control. Moreover, its use does not lead to alkalosis and it is very acceptable to patients.

Booth 13—Cameron's Surgical Specialty Company, Chicago, Illinois. Cameron's Electro-Diagnostoset consists of a series of Diagnostic Lamps and Instruments especially designed

for the examination and diagnosis of all the orifices and cavities of the body. This equipment is also used to examine the glands, vessels and viscera through surgical incision, and to aid the physician in applying treatment or surgery in any phase of diagnostic, therapeutic and operative procedure.

Medical leaders specify and recommend these lamps and instruments because they can be completely sterilized by boiling or steam pressure, and reveal the field in full detail, and actual color and condition. They put clean, cool, concentrated white light at your finger tips, and can be efficiently used by any member of the profession.

Cameron's Electro-Diagnostoset, Cameron's Thermaloop Cautery, Cameron's Electro-Cautery and Cameron's (radio frequency) Cauterodyne will all be on display at Space No. 13 during the Meeting of the Medical Society of the State of New York, June 2nd, 3rd and 4th.

Booth No. 12—G. W. Carnrick Company, Newark, N. J. This well-known manufacturer will exhibit its *Organotherapy* products made from both the secretory and the endocrine glands. These products are prepared from fresh glands of healthy food animals and every stage of the process is supervised and tested by our own chemists and bacteriologists.

Among the products shown will be Epinephrine in convenient forms; Pituitary Extract in exact individual doses; Thyroid Extract in forms easy of administration; and Pancreatin for assisting digestion; and Hormones of the Gonad glands, alone and in combinations.

Booth 26—Crookes Laboratories, Inc., New York, will exhibit their *Collosol* preparations, which are colloidal and non-ionic, and of special value when used with other substances, among them being the following:

Collosol Argentum, a preparation of silver for use on the skin and on the mucous membranes such as those of the eye and throat.

Collosol Manganese for furunculosis and other suppurative processes

Collosol Iodine as a spray for the nose Collosol Iodine Oil for use on the skin in ringworm, acne, and other intractable conditions Collosal Kaolin made with chini clay for internal use in intestinal disorders

Parlor A—Davies, Rose & Company, Ltd., Boston, Mass The benefits derived from your attendance at the Annual Meeting will not be full or complete without a visit to Parlor A, where Davies, Rose & Co, Ltd., Boston, Mass, are exhibiting preparations of marked importance. These preparations appeal not only to the general practitioner, but particularly also to those specializing in neurology, cardiology, and cholecystography

Mr Robert J Mansfield and Mr Houghton V Orne will be at Parlor A to receive you and to present you with full information concern

ing the products exhibited

Booth 17—Deriver Chemical Mfg. Company, New York, N Y In space No 17 will be exhibited Antiphlogistine, which is employed by physicians in all parts of the world. It is produced in eleven laboratories in different parts of the world, the main office and laboratory being in New York City

There is only one way, of course, in which an ethical preparation can attain practically universal use, and that is through ment. Antiphlogistine is the ideal method of applying and maintaining moist heat. Its hygroscopic and osmotic properties place it in a class altogether apart from ordinary poultices, fomentations, hot compresses, etc.

Booth 30—The DeVilbiss Company, Toledo, Ohio, for 40 years manufacturers of atomizers both for the professional and the patient, will exhibit at the 1930 meeting of the New York State Medical Society in Rochester a full line of their products

The professional sprays this year, are all chromium plated, which prevents tarmsh and gives a finish in keeping with the dignity and samtary appearance of a doctor's office. In addition to the improved finish, all DeVilbiss professional spray metal tops are all turned from bar stock instead of being stampings. This assures accuracy of the threads and gives the equipment long life.

The patient models, having adjustable tips have had the ups gold plated. The mechanism of these models has been improved so they will handle more readily the heavier oil solutions with less pressure on the bulb.

DeVilbiss has recently produced new literature on its professional models, which will be gladly sent, prepaid, to any physician requesting it

Booth 18—H. T. Dewey & Sons Company, New York, will exhibit grape juice in its natural forms, and also in pleasing combinations with other therapeutic substances. This juice is made by the cold process, thereby utilizing only the juice itself, and avoiding the tannic acid and other irritating extractives of the skin and seeds

The newest of the Dewey products is a combination of grape juice with mineral oil and agaragar, called grape minol, which has the taste of the grape juice and the therapeutic effect of the mineral oil Samples will be distributed from the exhibit booth

Booth 23—Electro Surgical Instrument Co., Rochester, N Y Many new developments in electrically-lighted surgical instruments will be found in the Electro Surgical Instrument Company display at Booth No 23

See the Dr David M Davis cystoscope and the modification of the celebrated "Young median bar excisor, by Dr Davis

I wo new instruments constructed from the ideas of G Oscar Russell, Ph D, of Olioo State University, will be shown They are the Ponofaryngoskop for the study of the vocal cords in action, and the Non gag Glottoskop

A new "ESICo" general transilluminator will be featured. It provides for transillumination of the antrum, frontal sinus, mastoid, gums, breast, etc. It is furnished with a cool limp, the heat from which never uses above the temperature of the body.

New table cautery transformers will be exhibited Transformers now may be used for heating electrodes for eye, ear, nose and throat treatments, as well as electrodes for cervical operations these transformers also light diagnostic instruments

Booth I—The General Electric X-Ray Corporation, Chicago, formerly the Victor X-Ray Corporation will be pleased to renew the acquimitance of its many patrons among physicans. Its virious forms of X-ray apparatus suitable for every medical need, will be shown and demonstrated

Booth 14—Harold Surgical Corporation, New York, N Y, will display among other thungs the Multotherm for electrosurgery, the Fretotome, and the Portatherm

Demonstration and explanation of the electro surgers will be held frequently during the exhibition

These talks will be given explaining both the physical and the clinical applications

The feature of the exhibit will be a low priced Carbon Arc Ultra Violet Lamp.

Booth 25—Health Products Corporation, Newark, N. J. Notwithstanding universal recognition of the value of the fat-soluble vitamins in cold-liver oil, prophylactic measures predicated upon its long use must fail in most cases through the patients' antipathy to its nauseous taste. Effective prophylaxis demands palatability for prolonged administration.

A new cod-liver oil derivative of assured vitamin potency—Cold-Liv-X—classified by the Council on Pharmacy and Chemistry, A.M.A., as a "cod-liver oil concentrate," will be shown. Both vitamins A and D are associated with a fraction of less than one per cent of codliver oil, and may be separated by saponification from the oily bulk and preserved in wafers which are standardized as to their vitamin content Cod-Liv-X wafers each contain at least 250 Vitamin A units and 100 per cent Vitamin D.

Booth 2—The Heidbrink Company, Minneapolis, Minnesota is established in booth No. 2. It will display a complete line of anesthesia apparatus and kindred necessities. Chief of interest among this equipment will be the Lundy-Rochester four-gas machine and the smaller Junior apparatus for obstetrics.

One of the particular features about the Heidbrink equipment is its extensive provision for the elimination of static electricity in and around the apparatus. Their equipment has been accepted by the Underwriters' Laboratories as being safe for use with inflammable gases.

The display will be in charge of Mr. Leslie B. Reason who will be glad to answer any questions pertaining to it.

Booth 11—Holland-Rantos Company, Inc., New York. N. Y. The full line of the Holland-Rantos Company's gynecological specialties will be shown, including the Rantos vaginal diaphragms. The company will also show a spermaticide Koromex, which is a lactic acid and jelly combination, put up in a collapsible tube, with a screw nozzle and cannula.

Booth 24—The Kalak Water Company of New York will have an exhibit at Booth number 24, and physicians are invited to pay it a visit and test for themselves the palatability of this dependable alkalinizing agent.

Visit the Kalak Water booth when you are thirsty or when you suffer from manifestations of acidosis. Kalak Water is not a laxative, and you can partake of it freely with benefit.

If you are interested in a simplified method

of rapidly determining the intensity of the urinary acidity, ask the representative at the booth to demonstrate the Kalak Indicators.

Room 102—"The K. & B. Electrical Equipment Co., New York, distributors of the best X-Ray and Physical Therapy apparatus, Kelley-Koett, will take great pleasure in discussing laboratory needs and equipment with prospective users and their many satisfied clients. A few of the latest developments will be shown and demonstrated. The company will display a real portable X-Ray apparatus and office fluoroscope."

Booth 16—Kny-Scheerer Corporation, New York, N. Y. The Kny-Scheerer Corporation, of New York, is exhibiting in Booth No. 16. Among the items of interest, which will be displayed at this exhibit, will be found the Brady Day-Light Lamps; the Thor Ultra-Violet and Infra-Red Lamps; a complete line of Rustless Steel Surgical Instruments; the Rubin-Aldridge Apparatus; the Kayess Head Lights and a variety of other new and interesting items pertaining to Surgery, Physio-Therapy, Diagnosis, Blood Transfusions, and also a line of Anatomical Models and preparations.

You are cordially invited to call and inspect this exhibit.

Booth 3—The Macmillan Company, New York, N. Y. You are cordially invited to visit the Macmillan booth at the Exhibit of the Annual Meeting of the Medical Society of the State of New York, where you will find many interesting as well as important books. Among them are Friedenwald's Pathology of the Eye, in which the author groups together the reactions of the various parts of the eye to similar injuries and disease processes, and points out wherever the analogy has seemed apt the similarity between ocular disease and disease of other organs; the fourth edition of McCollum and Simmonds' The Newer Knowledge of Nutrition, which brings the subject up to date from the standpoint of fundamental research; Terry's Introduction to the Study of Human Anatomy, planned to arouse and develop a critical attitude in the student by constantly requiring the verification of textbook descriptions with the evidence of the dissection before him and by proposing concrete questions to be answered and recorded by observation on the cadaver; Rolleston's Life of Sir Thomas -Clifford Allbutt, a study of the life of this eminent physician being a review of the progress of medicine of the last half of the nineteenth century and the first quarter of the twentieth. These are only a few of our newer books, but they will all be on display at this exhibit.

Booths 7-8—"Mead Johnson & Company Evansville, Indiana, will have on exhibit its complete line of infant diet materials, including Mead's Dextri-Maltose, Mead's Cod Liver Oil, Mead's Recolac, Mead's Non-Curdling Powdered Protein Milk and Mead's Non-Curdling Powdered Lactic Acid Milk.

There will also be for the examination of physicians a complete line of Mead's services such as diets for older children, height and weight charts, etc., all of which are free to members of the medical profession in any quantity desired.

All of our New York representatives will be on hand to meet their friends and to discuss the application of any of the Mead products to infant feeding problems."

Booth No. 10—Mellin's Food Company, Boston, Mass., will exhibit its preparations for infant feeding. These foods are widely known both professionally and popularly. Physicians will receive a hearty welcome at the Mellin's booth, and will find it an interesting source of information.

Booth 21—Merck & Company, Rahway, N. J., is one of the drug houses best known to the medical profession of New York State; and its representatives will be pleased to greet their many friends and to make new acquaintances. They will demonstrate many of their preparations, and give scientific explanation of the methods of manufacture and mode of action of the products.

Booth 19—M & R Dietetic Laboratories, Inc., Columbus, Ohio. Similac, a completely modified milk, is being exhibited at space No. 25. Representative will be pleased to answer any questions pertaining to the use of Similac either as a complement to the breast feeding or as a complete diet for infants deprived of breast milk.

Booth 22—The Mutual Pharmacal Company, Inc., Syracuse, N. Y. will exhibit products of their laboratory at booth No. 22 during the meeting of the New York State Medical Society in Rochester, June 2nd, 3rd and 4th.

The exhibit will include a line of general pharmaceuticals in tablet, fluid and capsule form, and also special products. Samples will be distributed.

Physicians are invited to visit the booth and meet the company's representative.

Table Space —The New York Physicians' Mutual Aid Association. This organization of more than 2,000 New York State physicians was incorporated in 1868. Its office is in the

1 1 1 Marie 12

New York Academy of Medicine. Its objects are to provide death benefits to the estates or beneficiaries of deceased members; pecuniary aid to members in urgent need; assistance to widows of such members and their dependent children. Its membership is hmited to members of the medical profession of the State, in good standing, under forty-five years of age, and in good health shown by satisfactory medical examination.

For sixty-two years it has promptly paid all death claims, in total more than \$1,368,000. Its contingent reserve of \$99,380, surplus of \$114,682, and Benevolence Fund of \$6,000 are administered by a Board of Trustees composed of fourteen members serving without any compensation. Loans from the Benevolence Fund to members in need from illness or misfortune are being constantly made, without other security, and without interest.

Its life insurance contract (renewable, limited term life insurance on the assessment plan) pays \$1,000 death benefit on proof of death from any cause. The cost is less than ordinary life insurance; it is superior to ordinary term insurance, being renewed with each assessment payment, without medical examination, and continually so renewed during the entire lifetime of the insured, at only actual cost of the insurance risk.

Blank forms of application for membership may be had on request at the office in the Academy of Medicine, or to the regular representative, P. H. Gould & Co., 730 Fifth Avenue.

Booth 31—Olajen, Inc., New York. The oversize jar of Alajen at the exhibit of this palatable reconstituent is presided over by George Fierheller, M. D., of Toronto, Canada, who developed the particular formula and vehicle embodied in the remedy. In any event Olajen is a most useful agent in building up children, convalescents, and in some respiratory infections. In novel form for an ethical product, its chocolate fudge taste appeals to children and that is half the battle. The samples are well worth tasting and the product worth a clinical trial.

Booth 32—Petrolagar Laboratories, Chicago, Illinois. At the Petrolagar booth there is always an active demand for the set of drawings by Tom Jones, of the University of Illinois, illustrating various types of constipation and bowel conditions. Sets are given free and mailed. They are helpful in consultations with patients and for comparison with roentgenograms. These pictures are distinctive and somewhat different from the usual anatomical drawing of the bowel in that they show perspective. They are not flat.

Table Space-The Photor Corporation, New York, will show the Gastro-Photor, an instrument for photographing the interior of the stomach. It is composed of a camera portion and a transformer for illumination. The camera portion is an integral part of a flexible rubber tube easily introduced into the stomach. It has two cartridges with a lamp for illumination interposed between them. Sixteen pictures are made with one exposure, stereoscopic in a vertical direction, and taking in the entire circumference at any level. About three-fourths of the entire mucosa are obtained at one exposure. Orientation within the stomach is made by fluoroscopic observation, and the relationship of the films to the various portions of the stomach by identification marks on the films themselves. Illumination of 12,000 candle power, a blue light, permitting the exposure in a fraction of a second, is provided by a special transformer. Ulcer, carcinoma, polypi and various surgical procedures in the stomach are easily visualized. Lesions on the lesser curvature and posterior wall of the stomach, sometimes missed by the X-ray, are brought to light on the Gastro-Photograms.

Booth 15—The Sanborn Company, Cambbridge, Mass., will exhibit its outfit for metabolism tests, and its electrocardiograph.

The Sanborn Grafic, for metabolism tests, is suitable for physicians and small hospitals. It gives accurate and entirely satisfactory results for routine clinical diagnosis.

The Sanborn Benedict is recommended for specialists, hospitals and clinics who want a larger metabolism tester adapted for the needs of specialized testing as well as for routine work.

The Sanborn Electrocardiograf has many new features; fixed lighting system, four-knob control box, safety string carrier, and a new (1930) camera with exclusive features. Sanborn Electrocardiografs are supplied either on a movable table for hospital use, or with carrying cases for outside use.

Booth 28—The Schering Corporation, New York, will show several imported preparations, among the newer ones being the following:

Progynon, a female sex hermone for oral use. Normacol, for chronic constipation.

Neutralon, an aluminum soda silicate for hyperacidity.

Chlorylen, an analgesic for the relief of neuralgic pain.

Vasano, for the relief of seasickness.

The Schering Corporation is well known to physicians and will welcome those who call at its booth.

Booth 33—C. M. Sorenson Company, Inc., Long Island City, N. Y., will exhibit equipment for the needs of the ear, nose and throat specialists, and of hospitals, especially those forms of apparatus requiring either suction or compression.

Approximately 30,000 Sorenson Tankless Air Compressors are now in the service of the medical profession. Type samples of all forms of

our apparatus will be shown.

Booth 29—E. R. Squibb & Sons, New York, Physicians will find at the Squibb booth a number of new products which should prove to be of unusual interest: Among these will be included the female sex hormone, Amniotin; the new genito-urinary antiseptic and bacteriostatic, Serenium; two wheat germ sugar products, Vitavose and Dextro-Vitavose; new preparations for the treatment of secondary anemia, Elixir Cupriferrum and Syrup Cupriferrum (for children); and a new product for the preparation of acid milk for infant feeding, Citabs. Well-qualified representatives will be present at the Squibb booth to answer inquiries concerning these new products. There also will be featured Cod-Liver Oil, Viosterol, Cod-Liver Oil with Viosterol—5D, Insulin, and Arsenicals.

Booth 9—Tailby-Nason Company, Boston, Mass. In connection with the exhibit of Nason's Palatable Cod Liver Oil, Tailby-Nason Company will show a giant cod taken from the Lofoten Waters of Norway for Nason & Co. a/s, the Norwegian subsidiary of Tailby-Nason Company. This splendid fish, 4 ft. 11 in. long and weighing 30 kilos, will form an interesting part of the exhibit of Nason's Palatable Cod Liver Oil, "The Better Tasting Kind," produced at Nason's plants in Norway, at booth No. 9.

Other important features of the exhibit will be the white rats used in testing the oil for its vitamin activity, and roentgenographs of the leg bones of rachitic rats showing the progress of the healing induced by Nason's Cod Liver Oil.

Booth 5—Taylor Instrument Companies, Rochester, N. Y. Tycos products manufactured by Taylor Instrument Companies for the medical profession will be demonstrated and displayed at space No. 5.

Outstanding among these products will be the following:

Tycos Recording blood pressure apparatus. Demonstrations given with Sphygmotonograms of your own blood pressure, if desired.

The Venostat Apparatus, as designed by Dr. C. S. Danzer, Professor of Medicine, Columbia

University, New York City A very interest

ing and valuable apparatus
Tycos Surgical Unit for Hospitals, also the
beautiful and practical lycos office-type
Sphygnomanometer

Tycos Lag Thermometer, designed especially for use in sterilizers. All hospitals will be interested in this invaluable protection

You are invited to visit our exhibit and receive such serviceable bulletins as "Blood Pressure—Selected Abstracts' and others, for which there will be no charge and no obligation will be involved

A movie showing the action of a fever ther-

mometer will also be shown

Booth 20—George Tiemann & Co., New York, will again exhibit a representative line of surgical instruments at the Annual Meeting in June One hundred and three years of successful business enterprise has enabled this firm to more or less predict new surgical instruments destined to success

This year it is featuring its Velvet Eye Catheters made of the famous Tiemann soft rubber compound and turned out under expert

supervision in their own factory

Another item on display is the Barton Rongeur embodying a mechanical principle which multiplies the power applied to the handles sevenfold. The instrument cuts its way through bones with remarkable case.

A new headlight which requires neither rheo stat or transformer but which may be plugged into any 110V lighting circuit and uses flishlight bulbs that may be purchased in any hardware store is another interesting feature

The Hibbs Spinal Fusion Set is another item

well worth consideration and study.

All these and many other surgical instruments, both new and tried, will repay a visit to booth No 20

Room 218-Transkutan, Inc., New York, will exhibit its new product Transkutan, for the treatment of rheumatic diseases This therapentic agent consists of a mixture of natural salts with menthol, camphor, and oils of turpentime and wintergreen, which is to be added to the water of a hot bath The combination of the drugs with the heat of the water induces an artificial rise in temperature which persists for some hours The non specific fever exerts a favorable influence on chronic rheumatic conditions, which is free from the danger of the rise in temperature induced by the injections of specihe bretern or proteins

Clinical data obtained from the treatment of over 100 cases in Shannon Lodge, Bernardsville, New Jersey, will be shown

Booth 4—The Wappler Electric Company, Long Island City, George Wm Finegan Rochester, N Y, distributor, will show a representative selection of Wappler equipment in space four The Wappler Money, silent valve tube rectifier x-ray generator will be shown The new Wappler Portable Diathermy apparatus, Model E, should be seen by every physician, whether general practitioner or specialist

Wappler cautery appliances, electrically lighted diagnostic instruments, cystoscopes, etc. will also be included in this exhibit

Booth 34—Winthrop Chemical Company, Inc., New York, N. Y. and H. A. Metz Labora tories, Inc., New York, N. Y. Since the Winthrop Chemical Company and the H. A. Metz Laboratories have been associated for some time, they will have a combined display in booth No. 34. One of the notable recent contributions to the world of medicine—Avertin Fluid the new anesthetic given rectally, is on exhibit. There you will also find the well-known Luminal and its various preparations Salyrgan, Spinocain, Protargol, Vigantol, Phanodorn, Veronal, Compral, Novocain, Pyramidon and The Salvarsans, the Dependable Originals that have stood the test of time

Room 217—Yawman & Erbe Mfg. Company, Rochester, N Y, has been designing systems and equipment for the past fifty years to meet the demands of record keeping of the medical profession. The work of a physician or hospital requires the making of a great number of records. Every thing will be covered by this exhibit from the registering of a patient to the final payment of the account.

Of special interest will be the Physician's Diagnosis Index, which is the mechanical memory of the modern, up-to date physician All diseases in the index are filed alphabetically by part of body affected. This practical system for recording your own experiences, and those of other doctors, provides an easy method of recalling all you have clinically accomplished and read.

The physician operating an X-Ray machine should be interested in the "B Label' X-Ray Safe designed by "Y and E" for the safe protection of X-Ray films

## 熞

## NEWS NOTES

#### SECOND DISTRICT BRANCH

The twenty-third annual meeting of the Second District Branch of the Medical Society of the State of New York was held on the evening of April first in the new building of the Medical Society of the County of Queens, at 112-25 Queens Boulevard, Forest Hills. This site is on the north side of Queens Boulevard, the broad, main highway from Jamaica to the Queensboro Bridge about two miles west of Jamaica. Dr. Charles H. Goodrich of Brooklyn, President of the Branch, presided. The lateness of the date of the meeting was in response to the request of the officers of the Queens County Society that the Second District Branch should have the honor of being the first outside medical organization to hold a meeting in the new building.

Officers of the State Society were present as follows: Dr W. H. Ross, President-elect, Dr. Charles Gordon Heyd, Treasurer, Dr. John A. Card, Speaker, Dr. James E Sadlier, Chairman of the Committee on Public Relations, and Dr. O. S. Wightman, Editor-in-Chief.

The program began at six o'clock with an inspection of the new building under the guidance of members of the local society. A supper in the basement was held at seven o'clock, and was attended by over sixty members. The business and scientific session of the Branch was held at 8.30 P.M. in the main auditorium, and was attended by one hundred and twenty members.

Following the usual custom, a representative from each of the four county medical societies on Long Island, the area included in the Second District Branch, made a report of the activity and progress of his society, as follows:

Kings County, by Dr. Luther F. Warren, Brooklyn, President.

Queens County, by Dr. Louis A. Voltz, Richmond Hill, President.

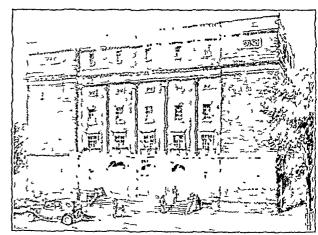

Nassau County, Dr. L. A. Newman, Port Washington, Vice-President.

Suffolk County, Dr. Frank Overton, Patchogue, Chairman of the Public Health Committee.

The report by Dr. Voltz contained the following history of the construction of the building of the Medical Society of the County of Overns

of Queens:—
"The membership of the Medical Society of the County of Queens had grown rapidly since the society's reorganization in 1921, and on account of the lack of accommodation suitable

for its meetings, the officers long cherished the idea of a home for the society. In 1923 the movement was initiated by the purchase of a suitable site, consisting of lots aggregating 200 x 100 feet on Queens Boulevard Many schemes were proposed and discussed in the Board of Trustees for financing a building project. In 1928 the society authorized the Board of Trustees to provide, plans for a building which with equipment was to cost not more than \$250,000. The board secured pledges from members and their friends by the close of the year of 1928, and at the beginning of the year of 1929 were in a position to

Building of the Medical Society of the County of Queens

go before the society for its first call on the building loan fund. Plans were approved and adopted April 16, 1929. The contract for erecting the building was signed May 28, 1929. Ground was broken June 10, 1929 with a public ceremony. Construction began June 17, 1929. The cornerstone was laid October 3, 1929 before a public gathering. From December 7th to 14th, 1929, a bazaar and public health exhibit were held in the uncompleted building which netted a profit of about \$14,000 to the society.

"We are now meeting in this home, built without a mortgage It provides a large auditorium seating about 450, 100ms for a large medical library, three other section rooms, and a number of business offices for the society's use. The building is not officially completed or opened, but it is expected to be dedicated about the second week in May We have held our first and subsequent 1930 meet-

ings here since the beginning of the new year, and the roll shows nearly one hundred

percent increase in attendance."

A message from Dr. J. N. Vander Veer, President of the Medical Society of the State of New York, was delivered by Dr. D. S. Dougherty, Secretary of the State Society, regretting his enforced absence on account of sickness, and expressing his expectation of returning to active duty soon.

Dr. W. H. Ross of Brentwood, Suffolk County, President-elect of the State Society, read an address in which he outlined the principal problem which he forsees will occupy the attention of the Medical Society of the State of New York during the year of his coming presidency. This problem will be the relation of the Medical Societies of the counties and state to the other organizations engaged in public health work, especially health departments and voluntary health organizations. Dr. Ross expressed the ideal of a unified health service beginning with health education of the people by teachers and editors, extending through preventive work by public health nurses along such lines as tuberculosis and diphtheria prevention, and culminating in effective treatment of the sick by family physicians,—all led and directed by the practicing physicians of the counties and state.

The scientific address of the evening was given by Dr. John O. Polak, who fills the chairs of obstetrics and gynecology of the Long Island College Hospital Medical School and who gave an informal talk illustrated with lantern slides on the subject of "Maternal Mortality in Obstetrical Practice." Dr. Polak reviewed the causes of maternal deaths, and dwelled particularly on the personal condition of the attending obstetrician. He enumerated eleven principal sources of puerperal sepsis,the ten fingers of the accoucher and his throat. As an illustration of the importance of the throat as a source of infection he described a series of infections occurring in the wards of an obstetrician, which ceased at once when the doctor started on a trip abroad, but recurred abruptly after he returned to duty, when it was found that his nose was a chronic carrier of streptococci.

The meeting was one of the largest and most interesting ever held by the Second District Branch. The papers of the program will be published in the Long Island Medical Journal.

#### THIRD GRADUATE FORTNIGHT OF THE NEW YORK ACADEMY OF MEDICINE

The third annual Graduate Fortnight of The New York Academy of Medicine, 2 East 103rd Street, New York, will be held from October 20 to 31, 1930 The general subject which has been chosen for this year is "Medical and Surgical Aspects of Acute Bacterial Infections."

The program as arranged is in two parts,—coordinated afternoon clinics to be held in ten important hospitals of the city, and evening meetings to be held at the Academy. An added feature of this year's Fortnight will be an exhibit of anatomical and pathological specimens and material bearing upon the various aspects of the subject.

Each of the hospitals cooperating in the Fortnical programs dealing with different phases of the general subject.

The program for the evening meetings to be held at the Academy includes discussions of:

Focal infections as a cause of disease. Osteomyelitis and acute joint infections.

Acute infections of the genito-urinary tract. Infections arising from tonsils and sinuses,

Infections of the middle ear.

Acute infections of the face and oral cavity.

Operative risks from infection

Operative risks from infection. Appendicitis. Bacteriemia.

Suppuration of lung and pleura,

Acute infections of the gall-bladder and biliary tract.

Infections of the skin and subcutaneous tissue. Acute infections of the upper respiratory tract including influenza.

The pneumonia and other pneumococcus infections.

Bacteriophage as a treatment in medical and surgical acute bacterial infections.

Puerperal sepsis.

Immunity-general and local.

Serum therapy.

Vaccine and non-specific protein therapy.

Rheumatic fever.

Acute and sub-acute bacterial endocarditis.

Meningococcus infections including meningitis. The list of speakers who have been invited to take part in the Fortnight includes prominent clinicians from many parts of the country who are recognized authorities in their special lines of work.

The profession generally is invited to attend. No fees will be charged for attendance at any

of the clinics or meetings on the program.

A complete program and registration blank for special clinics and demonstrations will be mailed on request to the Academy.

#### LEGISLATION

Refore this is read the legislature may have adjourned and all that will now be written will have passed into history.

Ten days before the close of the session the Assembly conference committees are all discharged and the bills remaining in their hands are turned over to the Committee on Rules, which continues to function to the end of the session. It is difficult after this period to introduce new bills in the Assembly and such as are introduced are referred to the Rules Committee. Several bills in which we are very vitally interested have been passed on to this committee. Among them are the three chiropractic bills and the medical advisory council bill.

The hospital licensure bill in which we are so deeply interested, after undergoing three amendments and being printed three times, finally passed the Assembly. It is still not in the form that we should like to have it, and will be amended a fourth time before it is acted upon in the Senate. The feature that has given us the most concern is to vest the Department of Social Welfare with every power that it should have for adequately licensing all hospitals, and yet free it of responsibility for conduct and management of hospitals, except where gross neglect or violations of the law occur. The ideal condition striven for in the enactment of law is to direct initiative in a more or less uniform way without hampering it, and to make certain that the public is amply protected against neglect or imposition. It is expected that a year or two after the law has been in operation, amendments will be necessary, but the bill has been considered by so many people, and their suggestions incorporated, that such amendments as may be offered are likely to be of minor character.

The Department of Labor investigated the industrial dressing stations in New York City a few months ago and reported finding many of them unfit for caring for injured workers. As a result, it has had introduced a bill which requires that "The places where such medical, surgical or other attendance or treatment is provided, shall be maintained and operated in a sanitary manner in accordance with regula-

tions of the industrial board." There has been some discussion as to whether these stations, when they are outside of a doctor's private office, should not be considered dispensaries. It is true that they cater to a special class of patients, but these need not all come from one industry, and it can be imagined that if a man sought treatment at one of these places, he would be cared for, if he guaranteed payment of the services, regardless of whether he were employed or not at any industry. As dispensaries they should be visited and inspected by the Department of Social Welfare, which has this authority for all dispensaries. It seems, therefore, unwise that the industrial board should be asked to promulgate another set of rules and regulations. This brings forcibly to mind the need the Department of Labor has for medical advice and it is one of the best arguments that can be advanced for enacting the bill which is now before the legislature, authorizing the creation of a medical advisory council in the Department of Labor.

Technicians working in dental laboratories last year sought and received from the legislature authorization for the creation of a special type of technician to be called "Master Dental Technician," and who should be registered and titled by the Department of Education. This year the dentists convinced the legislature that it was an unwise move and the law was repealed. Within the last week a bill was introduced in the Assembly which would authorize the Department of Education to prepare a method of examining and registering technicians in medical laboratories. It provides that after its passage only those persons who can pass an examination laid down by the Department of Education shall be entitled to be considered technicians, and all shall be registered with the Department of Education. It imposes a penalty upon any person who would employ for technical work anyone who is not a registered technician. The bill fails to recognize that technical ability is not always based upon educational qualifications, but many times may depend upon muscular skill. On the whole, the bill seems to be drawn for the benefit of certain technicians rather than for the public good

### LONDON LETTER

March 1, 1930

Bethlem Royal Hospital:

The amazing growth of London which has added 70,000 to its population during the last three years, and now includes nearly 9,000,000 within the Metropolitan Police District, has led to the erection of many new buildings and to much reconstruction, and we old Londoners see with real regret the disappearance of familiar landmarks. One of the best known is now marked for destruction, for it has been decided to remove the Bethlem Royal Hospital (known to generations as Bedlam, the first of the lunatic asylums) from its present site in Lambeth Road to Croydon. The Hospital dates from the year 1547 when Henry VIII granted the monastery of "St. Mary of Bethlehem" to the citizens of London for the treatment of the insane. One regret at the removal of this building, known the world over, is qualified by the knowledge that in its new home its beneficent work will be facilitated by every device known to modern Hospital Architecture, but, as is the Londoner's curious custom, grave concern was expressed as to the fate of an obelisk in the ground of the Institute. This monument, a featureless mass of stone, was originally erected by the Common Council in 1770 at the centre of St. George's Circus to act as a milestone and lamp standard when the new Blackfriars Bridge was built, but it soon became the recognized memorial of Brass Crosby, a Lord Mayor of London who suffered imprisonment in a great struggle for the freedom of the Press. Until the accession of the Georges, the proceedings in Parliament were not known to the Public, but early in the 18th century reports appeared under the title of "the Senate of Lilliput" and its very name may give some idea of the character of the reports. In 1771, the Commons issued a proclamation forbidding the publication of debates, which had been fostered by John Wilkes, the Member of Parliament for Middlesex, who had already been prosecuted for his attacks on Lord Bute and the Cabinet in the "North Briton" newspaper. Warrants were issued for the arrest of six printers, but the Lord Mayor Crosby declared the warrants illegal, and was in his turn arrested and committed to the Tower of London. He remained in the Tower for six weeks when he was released on the prorogation of Parliament. He was met at the Gates of the Tower by the Common Council in their robes and the Hon-

orable Artillery Company welcomed him with a salute of 21 guns. So obviously was Public Opinion on the side of the Press that the attempt to hinder its publication of Parliamentary proceedings was quickly dropped, and from this time began the rise of the great newspapers of which the "Times" and the "Morning Post" still remain. We are glad to have the assurance that the obelisk, on which is engraved the name of Crosby, is to be preserved and re-erected in a public garden formed from part of the property.

Medical Aspect of Gas Warfare.

Those of us who have a lively recollection of the Air Raids over London in the Great War are not unmindful of the possibility that the progress of Aviation since the War may make attacks from the air on the civil population still more devastating should another European war occur, and this risk is enhanced by what is euphemistically called the use of "chemical warfare." The medical aspect of gas warfare is thus a matter of concern to our Profession; and at a recent meeting of a Dinner Club to which I belong, Major-General Barrow, an Army Medical Officer, who is in charge of the Antigas organization, gave us his unofficial views on the subject. He divided attacks from the air into two divisions: (1) material, that is attacks on ports and harbors by high explosive, and (2) moral, attacks on the civilian population by poison gas, such as phosgene, chlorine, arsene, or the more persistent gases. His department was concerned with the purely defensive methods to be adopted to protect the population in the event of attack; and while he did not consider the risk so great as is visualized by some authorities, he urged that the general public should be instructed in the methods of countering the effects of gas, and referred to a manual on the subject issued by the Red Cross and Order of St. John of Jerusalem. An interesting point arose in the subsequent discussion as to the influence poison gas had had on the later development of pulmonary tuberculosis. a matter of real importance in considering postwar invalidism. Everyone agreed that there was no evidence that poison gas had any influence in the subsequent development of tuberculosis, but it appeared quite obvious that the precautions taken to protect armies in the battlefield are much too elaborate to be used by the civilian population of great towns.

II. W. CARSON, F.R C.S.

## MEDICAL WARES

#### GRAPE JUICE

The grape is the oldest cultivated fruit of which there is a record, and its juice has always been prized as a food and drink which nourishes the body and cheers the mind. It shares with milk the unique distinction of remaining wholesome and even improved after it has been kept for some time and has undergone changes which would spoil most other foods. Wandering tribes of nomad shepherds whose riches were in flocks and herds have always found their principal sustenance in milk whose natural fermentation produces a preservative, lactic acid, which maintains the curds and whey and butter unimpaired as foods. When the ancient nomads settled down in one place and became farmers, they exchanged their herds for vineyards, and their milk and honey for corn, wine and oil,-an excellent combination of protein, carbohydrate and fat. corn and oil were stable products, but the grape juice readily underwent changes with the formation of alcohol,—a natural preservative.

The grape from early days has always been the most universal and the most popular of all fruits. The ancients valued it as a necessity as well as a luxury for both the king and the peasant, for it was a stimulating food to the strong and medicine to the weak. Modern research has not dimmed the reputation of the grape, but it has enhanced it. Vitamines, mineral salts, and antacids are in the grape and its juice as well as in the orange and the tomato. Although pediatricians may deify the orange, yet the grape could supply the valuable qualities which are inherent in the other juicy fruits, as it did before the others were discovered. Moreover, the different kinds of grapes have a wide range of usefulness, varying from those whose pulp is firm and solid, as the raisin, to those which are delicate sacs of juice.

The grape is unique among fruits in the adaptability of its juice to the needs and desires of human beings. Only the apple, the blackberry and possibly the orange produce juices which could be considered as competitors of that of the grape. The universal popularity and satisfaction of the fruit is indicated by the fact that the name of its juice in practically all European languages, both ancient and modern, is wine or vin, whose root also appears as the word vine, or the plant on which grapes grow.

Therapeutically, grape juice would still have a large place in the thought and opinion of physicians if it were used only before it undergoes alcoholic fermentation. While alcohol adds some

qualities which are desirable, yet most of those which make the juice attractive and satisfactory are in the juice while it is still fresh and unchanged. The excellent forms of grape juice and wine which are on the market form a series beginning with that which is entirely fresh, or free from alcohol, to that which has undergone a maximum amount of fermentation and contains from twelve to fourteen per cent of alcohol. In a general way it may be truthfully said that the juice with very little or no wine is suitable for young people, while that containing alcohol agrees well with adults and the aged.

The brands of fresh grape juice which are on the market may be divided into two general classes, those made by the cold process, and those in which the pulp is heated before it is pressed. The principal reason for heating the pulp is to soften it so as to obtain a greater percentage of juice; but when the heated pulp is pressed, much solid matter also exudes from it and gives a turbid appearance to the finished product. Preheating the pulp also promotes the solution and extraction of tannic acid and other undesirable substances from the skins and seeds of the fruit. If a grape juice is turbid and has a sour astringent taste, one is justified in assuming that it has been made by the hot process.

Grape juice carefully made by the cold process is transparently clear in appearance, and has the smooth taste which is natural to the pulp of the fruit; while that made by the hot process has a taste like that which one get by chewing a whole grape including the skin.

Grape juice has a peculiar value to the physician because of its quality of blending with other therapeutic substances and imparting to them its own dominating taste and its ease of assimilation by the stomach. A prominent characteristic of modern therapeutic agents is their attractiveness, which is often secured by blending them with grape juice, or wines of various alcoholic strengths. Cod liver oil, olive oil and mineral oil, for example, may be blended with grape juice in an almost perfect emulsion which has the taste of the juice or wine. The process consists in forcing the mixture of juice and oil through the tiny openings of a homogenizer, thereby breaking the oil in particles so small that their surface tension holds them suspended in the liquid.

Grape juice and wine also blend well with minerals, especially iron and calcium, and make them pleasant to the taste and easy of assimilation.

## THE DAILY PRESS

#### CENSUS TAKING

The National census is of special interest to public health workers for it is the principal basis for the estimation of vital statistics. It would seem that taking the census would be a simple process; but the newspapers have printed columns of storics about the difficulties encountered by the enumerators. The New York Times says that the newspaper publicity has allayed the fears of many of the citizens. The issue of April eleventh says:—

"Census-takers in this city are finding examples of ignorance and fear which, when learned of by the hinterland, will put New York on the receiving end of the vaudeville jokes. A Chinese laundryman refused to hold talk with the census man until he produced a laundry ticket. An octogenarian musted upon giving his age as 21. A woman assaulted her husband for replying that he was the head of the house. Many citizens refused to open their doors. Others angrily declined to give their ages Thousands had never heard of the census and considered their affairs none of Uncle Sam's business any-

"This picture of urban ignorance is dismal. It may upset the fine balance in American geographical feeling."

The Times also printed the following experi-

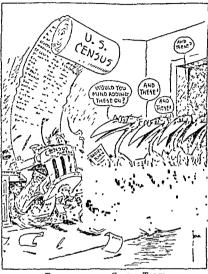

ences of census takers :-

"A woman in East Seventy-third Street gave the occupation of her husband as "drunkard"

and insisted upon it.

"A psychopathic patient at Ward's Island insisted that she was Queen Victoria, and the enumerator was forced to get the information from the Department of Hospitals' records.

"At Fifth Avenue near 114th Street, a Negro

TROUBLES OF THE CENSUS TAKER From the New York Herald Tribune, April 3, 1930

who had given all the necessary information to the enumerator, suddenly seized the census sheet and copied down the number at the top. The enumerator was puzzled. 'Wish me luck, big boy,' said the Negro. 'I'm playin' that number in the policy game tomorrow.'"

#### INSURANCE AGAINST SICKNESS

The National Committee on the Cost of Sickness is collecting statistics on the prevalence of sickness and the cost of the care of the patients. Figures on the prevalence and cost of sickness among the families of working men have been collected by the Metropolitan Life Insurance Company, and are used by the New York Times of March 21 as the basis of an editorial which says:

"Data collected by the Metropolitan Life Insurance Company indicate that "sickness is a hazard of life comparable with death and accident." Of the total number of workingmen's families (3,281, consisting of 17,129 persons) from which schedules of expenditure for six months were received, only 6 per cent spent nothing for medical care. Most of that small remnant probably had some minor ailment within the period. As the time covered extended from January to June, it may be assumed that the cost of medical care was greater than it would normally be in the second half year.

"On the basis of the figures, the average total expenditure for each family for the year would

be \$140. But 40 per cent of all the families spent less than \$25 each, another 20 per cent between \$25 and \$50 and another 20 per cent between \$50 and \$100, this expenditure including not only medical and hospital care but medicine and dental services, eye examinations and glasses. The average expenditure per person for the year was \$13.48, which is probably under the amount actually spent.

476

"It can hardly be the fact that such costs of medical care represent what should be spent if families had adequate medical attention in the broadest sense—both preventive and curative. But this study is a beginning that will help to put medical care on an economic basis—to be estimated and to be provided for, as one now provides against death by life insurance, or against disability by accident insurance. Sickness is a hazard which every one has to encounter, soon or late, and the economic cost of it can be determined in advance when enough persons are taken into the reckoning, over a period of years. It is to be hoped that the committee which has begun this study will itself have a life long enough to make the computations for future generations."

#### PART-TIME MOTHERS

How a wife may combine a "career" with housekeeping is the subject of an editorial in the New York *Times* of March 21, based on a statement of Miss Frances Perkins, State Commissioner of Labor, that part-time mothers are failures unless they earn at least \$3500 annually. The editorial says:

"Few mothers nowadays find motherhood a full-time job, as Miss Perkins said, because housekeeping no longer includes the labors which have been either taken over by canning factories, knitting mills and other industries, or which remain in the home but are greatly simplified by modern equipment. Keeping house is a job in itself. It is complicated by the presence of children, but it does not depend on them for its existence. The two jobs—keeping house and bringing up children—have gone together for such a long time that now it is

hard to dissociate them. But many mothers are doing just that, and taking on a third job outside the home.

"If they are failures, it is not from their own point of view. Their earnings, even though less than \$1,000 a year, yield to the family necessities or luxuries not otherwise obtainable. Often the housekeeping becomes a family affair, with the children taking small responsibilities not harmful to their budding characters. They cannot be with their mother nor have her on call as constantly as if she were at home all day, but many child psychologists consider this really a helpful factor in their education. Attempting three jobs calls for courage, and succeeding in all three presupposes remarkable traits in the part-time mother. The effort may aid in developing necessary qualities."

#### HAZARDS TO HEALTH IN THE HOUSEHOLD

One is subject to accident everywhere he goes and even while he lies in bed. The Sun of April 4 commenting editorially on household hazards to health says:

"A workman in a hazardous trade quits work and goes home—to face fresh hazards. Last year there were four million accidents in the home. 24,000 of them fatal. Falls are responsible for nearly half of all domestic accidents—falls on floors, over objects, off ladders, against tables, in bathtubs. The secretary of the Pennsylvania Department of Health has drawn up a list of precautions to be taken at home:

"'Do not start a fire with gasoline or coal

"'Do not attempt gymnasium stunts in the home—such as standing on ladders, chairs and

window sills—unless you have a firm foundation or are otherwise protected from falling.

"'Keep your medicine chest inaccessible to children and never take any medicine yourself from a bottle in the dark.

"'Do not start your automobile in a closed garage.

"'Do not point a gun at any one, even though you are sure "it isn't loaded."

"'Use reasonable care and caution in per-

forming your daily chores or duties.'

"Every housekeeper or householder should be able to add at least one specific 'don't' to this list. Rugs, can openers, windows, pictures, doors in the dark—these and a hundred other potential sources of danger surround everybody who is housed."

#### BOOK REVIEWS

THE DOCTOR IN COURT. By EDWARD HUNTINGTON WILLIAMS, M.D. 12mo of 289 pages Baltimore, The Williams & Wilkins Company, 1929. Cloth, \$3.00.

This is a book of the experiences of the Expert Medical Witness, presenting sidelights upon legal and judicial practice.

The book is divided into eighteen chapters referring particularly to many of the methods employed in our Courts as to the Direct and Cross-Examination of the Medical Expert.

The author quotes many clever quips and quick repartee on the part of the medical expert during crossexamination in criminal cases, and also discloses the art of cross-examination in which the medical expert is placed in an unenviable situation.

The book is entertaining and readable, particularly for the physician who frequents the courts as a witness, and the lawyer whose major practice is that of the trial counsel in negligence and criminal cases.

EDWARD E. HICKS.

DR. COLWELL'S DAILY LOG FOR PHYSICIANS: A Brief, Simple, Accurate Financial Record for the Physician's Desk. Octavo. Champaign, Illinois, Colwell Publishing Company, 1929.

The general practitioner, desirous of obtaining an account diary for simple recording of his daily services to patients, will find this "Log" very practical for that purpose. It provides a daily sheet for noting the transactions in connection with each patient seen. Provision is made for carrying the daily totals to the monthly summary.

It is a well arranged, compact volume, giving a complete record of the business of each day. For a quick ready reference book, requiring little writing in connection with each entry, indicating the financial status of daily practice, we recommend it.

It is attractively bound and of convenient size. A copy is issued annually conforming to the calendar year.

OUTLINE OF BACTERIOLOGY. By HENRY A. BARTPLS, B.S., D.D.S. Octavo of 128 pages, illustrated. New York, William Albert Broder, 1929. Cloth, \$2.00.

A handbook of value in setting forth fundamentals and essentials of bacteriology for the student. The sequence of facts presented in such a comprehensive manner that the beginner cannot mistake the elements of this interesting study. The questions at the end of each chapter are valuable for review. A useful book that can safely be recommended to all students.

LEONARD KOHN.

FUNDAMENTALS OF PATHOLOGY. By JOSEPH SCHROFF, B.S., M.D., D.D.S. Octavo of 109 pages, illustrated. New York, William Albert Broder, 1929. Cloth, \$2.50.

Pathology in review—a book that sets forth tersely everything that its title implies. The author follows out concisely and with dispatch the purpose for which the work has been written. The text, illustrations and questions all go to make up a compendium of real worth. A valuable addition not only to the oral hygienist's library, but to the dental student's, medical student's and dentist's library also.

LEONARD KOHN.

PRACTICAL MATERIA MEDICA: An Introductory Text to the Study of Pharmacology and Therapeutics Designed for Students of Medicine. By CLAYTON S SMITH, PhD., M.D., and HELEN L. WIKOFF, Ph.D. 12mo of 300 pages 1929. Cloth, \$3.25.

This excellent book of 300 pages, especially written to meet the needs of the medical student, gives a brief and well arranged exposition of the subject.

The introduction treats of the Classification of Drugs, the Pharmacopoeia and its Preparations, the Administration of Drugs and Dosage.

Following this, the Inorganic and Organic Materia Medica is concisely presented giving the necessary essentials recarding cach drug without burdening the student with details he will have no use for. The chapter on Toxicology adds much to the value of the book. Likewise, there are some practical points regarding prescription writing and fundamental pharmaceutical operations that will be of great help to any student.

PRINCIPLES AND PRACTICE OF MINOR SURGERY. A Textbook for Students and Practitioners. By EDWARD MILTON FOOTE, A.M., M.D., and EDWARD MEARIN LUTINGSTON, B.Sc., M.D. Sixth Edition. Octavo of 787 pages, illustrated New York and London, D. Appleton & Company, 1929. Cloth, \$10.00.

This book is most interesting and is the product of much thought and experience. The illustrations are clear and instructive. In this latest edition the text book consists of three parts devoted respectively to surgical technic, surgical processes and localized surgical treatment.

The chapters devoted to the surgical affections of the various parts of the body have been thoroughly revised and considerable new material added. This volume should prove of great value to students of medicine, ceneral prartitioners and general surgeons, especially those practising industrial surgery. The descriptive part of the text is supplemented by very excellent illustrations made from actual photographs.

R. F. H.

OSTEOMYELITIS AND COMPOUND FRACTURES AND OTHER INFECTED WOUNDS: Treatment by the Method of Drainage and Rest. By H. WINNETT ORR, M.D. F.A C.S. Octavo of 208 pages; illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$5.00.

This edition is a small compact volume which deals with a subject of vital interest to the general surgeon and the Orthopedic surgeon. It takes up the subject of antisepsis from the time of Sir Joseph Lister and explains in detail the various points of interest. It gives is a most difficult one to treat properly and, brings out us food for thought in the treatment of a disease which many points which are fundamentally sound and which produce the most satisfactory results. Dr. Orr in this volume discusses Osteomyelitis resulting from infection within and also Osteomyelitis resulting from compound fracture. The last chapter in the volume deals with clinical results and judging from the report of these results the Orr method of treatment should be carefully studied by all surgeons dealing with bone pathology.

HERBERT C. FITT.

#### PRESIDENT'S LETTER IN MINNESOTA

A feature of Minnesota Medicine is a page devoted to a monthly letter of the President of the State Medical Association. That in the April issue by Dr. S. H. Boyer, is on the personal contacts of physicians, leading up to a plea to attend the annual meeting on July 14-16 in Duluth. The President says:

"Probably the greatest need today of the rank and file of the medical profession is contact with each other, because contact brings an exchange of experiences and ideas.

"Wherever men with common interests and purposes gather together to learn from each other, they soon discover that petty differences which had once kept them apart lose their magnitude in a new perspective or completely vanish amid the bigger and better things born of the collective search for knowledge. Surely it is permissible in this connection to quote from the Presidential Address by William Osler before the Medical and Chirurgical Faculty of Maryland: 'No class of men needs friction so much as physicians; no class gets less. The daily round of the busy practitioner tends to develop an egotism of a most intense kind, to which there is no antidote. The few setbacks are forgotten, the mistakes are often buried, and ten years of successful

work tend to make a man touchy, dogmatic, intolerant of correction, and abominably self centered. To this mental attitude the medical society is the best corrective, and a man misses a good part of his education who does not get knocked about a bit by his colleagues in discussions and criticisms.

"A masterly expression is it not? But it applies to a considerable number of us, in the cities as well as in the country. Where it applies in the cities it is of greater reproach, for there contact is easily had with one's fellows. Whereas in the rural districts the doctors serving an extensive territory may be so widely scattered that, despite good roads and autos, a real sacrifice may be suffered in getting together. Yet the sacrifice is more than compensated by the resulting mutual understanding of each others problems, both social and scientific. It has been said that every doctor is known to be a thoroughly good iellow by everybody else except another doctor. If that be so, then we doctors are allowing some very small personal envies and jealousies to cheat us out of the greatest of kindly sympathies, companionships and friendships that our poor human society has to offer to individuals."

#### WORK OF THE MINNESOTA STATE ASSOCIATION

The April issue of Minnesota Medicine has the following editorial on what the Minnesota State Medical Association has accomplished in the last few years:

"The committee which has accomplished the most and naturally has spent the most, has been the Legislative Committee. Not one man in a thousand could or would have done the work that Dr. Herman Johnson has done with the legislature the past few years. And what has this committee accomplished? The prevention of undesirable legislation is usually the major part of legislative accomplishment and when it comes to legislation affecting medical affairs there has been no exception. Almost yearly the wild reformers calling themselves anti-vaccinationists and anti-vivisectionists have to be combated; the establishments of new cults prevented; and the extension of the rights of medical cults already licensed has to be curtailed.

"In 1925 this committee obtained a reduction in the statute of limitations from six to two years to conform to the statutes in force in most of the other states of the union. The long period of six years has been responsible for the high incidence of malpractice suits in Minnesota which had reached such a point that one insurance company operating in the state was about to materially increase its rates. The yearly saving to physicians in this state has undoubtedly amounted to more than the full amount of our present state dues

amount of our present state dues.

"The Basic Science Law went into effect May 1, 1927. Since that time but two chiropractors and only twenty-one osteopaths have passed the Basic Science examinations, while during the five preceding years an average of forty-three chiropractors were yearly licensed in Minnesota. Fifty-one osteopaths were licensed during the six year period prior to this Act.

(Continued on page 480-adv. xiv)

You Know There's a Club for Every Stroke

LMOST any player can swing around the course with a single club, dubbing drives, lifting fairway sods and bringing home a century mark or more for the final score But the finished golfer needs a club for every shot—a studied judgment of approach or putt before the club is selected.

Similarly in artificial infant feeding. For the normal infant, you prefer cow's milk dilutions. For the athreptic or vomiting baby, you choose lactic acid milk. When there is diarrhea or marasmus, you decide upon protein milk. In certain other situations, your judgment is evaporated milk.

Dextri-Maltose is the carbohydrate of your choice for balancing all of the above "strokes" or formulae and aptly may be compared with the nice balance offered the experienced player, by matched clubs.

To each type of formula (be it fresh cow's milk, lactic acid milk, protein milk, evaporated or powdered milk), Dextri-Maltose figuratively and literally supplies

the nicely matched balance that gets results.

Violet C. Smith Superintendent

No. 1 Broadway Dobbs Ferry N. Y. Telephone Dobbs Ferry 2274

Inspection invited Information upon Request (Continued from page 478)

The law has apparently had the desired effect of barring the unqualified from becoming licensed in this state in the future.

"The revision of the Medical Practice Act in 1927 effected certain needed changes in the old law. The yearly fee for registration of physicians has furnished the means of enforcement and that this means has been utilized is shown by the report of the investigating attorney that in less than two years ninety-eight cases have been investigated and twenty-seven cases brought into court with twenty-three convictions.

"If it had not been for the legislative committee tax, supported hospitals would have been opened to the medical cults; the laboratory of the Venereal Division of the State Board of Health would probably have been discontinued; and a limit would have been placed by law on medical fees coming under the Industrial Commission.

"The next most expensive committee of the Association has been the one on Public Health Education. The activities of this committee have been so diversified and its influence has been exerted in so many directions that the results are less tangible. They undoubtedly are nevertheless far reaching. The efforts of this committee have been to foster medical influence in the direction of the various health organizations in the state. This has been accomplished in part through county society committees on Public Health, by assisting health organizations in putting on approved programs and by assisting the Minnesota Public Health Association in the preparation of its publications and otherwise. Weekly newspaper service has been conducted throughout the state and radio talks have been furnished.

"One of the worthwhile undertakings of the Association which should be mentioned is the Consultation Bureau conducted by Dr. W. A. O'Brien in *Minnesota Medicine*. The county secretaries' conference has been made possible by the increase in dues and the annual meeting is no small item of expense.

"While we do not approve of extravagant expenditures by the State Association, the above recital seems to substantiate the view that there has been value received. The whole question is whether we are to continue to be an organization which through its various agencies is going to make its influence felt, or whether the State Association is to revert back to its former condition of innocuous desuctude."

## NON-SPECIFIC FEVER

## Easily—Safely—Controllably Produced

IT is now possible to offer to the medical profession a safe, easily controlled and administered method for the production of non-specific fever. The method is not promoted as something in the experimental stage. It has been thoroughly tested by qualified physicians for nearly eight years.

Unlike injection therapy employing stock vaccines, autogenous vaccines, and non-specific proteins, this is a pleasant external treatment based on skin stimulation. It may be employed more frequently than injections without danger of shock or undesirable reactions.

Because it acts by way of the skin, it is aptly called transcutaneous therapy, and the activating substance, is called Transkutan. Transkutan is supplied in three dosages, in convenient 5-ounce bottles, each sufficient for one treatment. It is a scientific combination of a highly concentrated solution of natural mineral salts with turpentine, oil of wintergreen, menthol and camphor.

Transkutan is used in a hot bath followed by a sweat pack and six to eight hours rest. As may be easily de-

termined by observation, a substantial increase in body temperature is produced which slowly and regularly abates. There is concomitantly a marked diaphoresis and generally a leucocytosis.

Transkutan baths have been proven to be of the greatest value as adjuncts in the treatment of diseases of the rheumatic group. Arthritis, especially, of various categories, has yielded to the beneficial results of Transkutan baths. Records are available of many long-established cases successfully treated. Every physician has such cases. Every physician should, therefore, investigate Transkutan. All inquiries should be directed to the address below on your office stationery as Transkutan is sold only to the profession directly.

TRANSKUTAN, Inc., 8 West 10th Street, New York, N. Y.

Gentlemen:

Kindly send me, without obligation, full information on the use of Transkutan for the casy, pleasant, safe and controlled production of non-specific fever.

#### COUNTY HEALTH DEPARTMENTS IN IOWA

The March issue of the Journal of the Iowa State Medical Society has the following account of the establishment of the first County Health Department in Iowa under the new law:

"To Washington County goes the distinction of organizing the first County Health Unit under Iowa's new and progressive law. This same county was the first to have a county hospital This success is largely due to a united and constructive County Medical Society.

"The meeting of the Washington County Medical Society for November 5, 1929, was set aside for the consideration of the County Health Unit.

"The president of the county society, Dr. John L. Fry, was authorized to appoint a representative committee from over the county to present the matter to the County Board of Supervisors. This was so well done that at the meeting of the Board on December 21, 1929, a County Health Board was named. This Board is made up of three physicians.

"This Board soon met and organized and

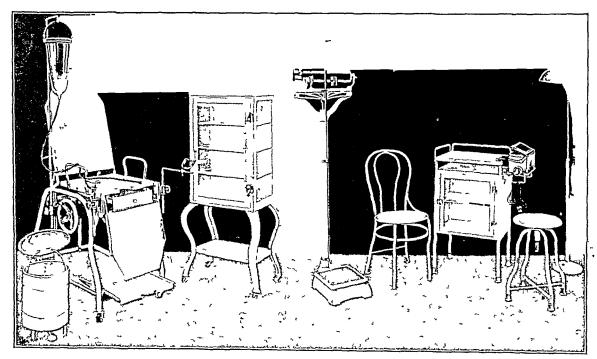

after thorough consideration, recommended that the County Unit Plan be adopted, and as soon as this should be done that Dr C. W. Stewart of Washington be selected as County Health Physician. The County Board of Supervisors in regular meeting February 26, 1930, accepted the plan as recommended and made the necessary appropriation.

"To show exactly how this unit is to be financed and operated, the resolution passed by the County Board of Supervisors is given in full.

"'Whereas, smallpox and other communicable diseases have been quite prevalent in this county in recent months, causing considerable expense to the county as well as to private citizens, also causing much loss in time, schooling and interference with trade. And,

"'Whereas, a unified health service promises increased efficiency in health protection and disease prevention at a minimum financial outlay. And,

"'Whereas, the Board of Supervisors of Washington County, Iowa, acting under the (Continued on page 483—adv. 2vn)

COUNTY SOCIETY OFFICIAL PLANS IN IOWA

The March number of the *lowa State Medical Journal* has a list of standard activities

to be adopted by every county society. The

"In response to numerous requests from county society officers for advice as to how their society could be made more active, the managing director with the counsel of various officers of the state society prepared the following outline of such activities. The outline is printed here so that it may not only come to the attention of county society officers but that all the members may at a glance secure a general idea of interesting and fruitful projects which the active county society may undertake.

The plan continues:

I. Unity and Harmony: One hundred percent membership of qualified physicians in each county is the first step towards unity.

II. Scientific Work and Programs: (A) Regular monthly meetings should be held except possibly during the summer months. A dinner preceding the session, a simultaneous meeting of the wives (or Woman's Auxiliary).

or special features on the program, and attractive announcements mailed a few days before the meeting, will help create interest in the programs and increase attendance.

III. Legislation, Politics: (A) Each county society should have a Legislative Committee, the members being selected for their interest

and activity in local politics.

- (B) A careful check should be kept on all pending medical and health legislation, and the attitude of the society should be communicated to the Legislative Committee of the state society, or, through the delegate, to the House of Delegates, where general legislative policies are determined.
- (C) Maintain a constant contact with candidates before primaries and elections: Know their attitudes toward health and medicine. Have the various candidates appear before the society prior to the election and discuss these matters with them, urging that they go to the state society Legislative Committee for professional advice in public health matters just as they go to a private physician in personal medical matters.
- (D) Work for votes for the right man: Every member of the society should take an active part. The county medical society can be the strongest single political power within the county, if its members will exert the tremendous influence they have.
- (E) During the General Assembly, let your legislators know by letter, telegram, telephone and personal words, that you are following their activities regarding health and medical legislation.

IV. Public Health: (A) Each county society should have a committee on public health activities or public relations, whose duties would include:

include.

- 1. Advising with all lay organizations engaging in any kind of health work, regarding their programs and activities.
- 2. Making recommendations to the society regarding approval (or not) of such lay health undertakings.
- 3. Investigating the possibility of a County Health unit as permitted by the new law on that subject.
- 4. If no other special committee exists for the purpose, the conduct of such lay educational measures (lectures, motion pictures, newspapers, etc), as are feasible within the county.
  - (B) Care of the Indigent Sick:
- 1. Sociological Aspects: This problem often estranges county officials and many citizens from the medical profession because of differ-

(Continued on page 485-adv. xix)

(Continued from page 484-adv. xviii)

ences over procedure in the treatment of sick paupers and payment therefor.

- 2. Official Responsibility: The county society should seek first to establish the legal fact that the Iowa Statutes contemplate payment in full for all properly authorized medical services. (See Sections 5320 to 5334 of the Iowa Code).
- 3. The County Contract: Some mutually acceptable arrangement should be made between the county supervisors and the county medical society. There are several varieties of contracts covering such services which are now operating satisfactorily here in Iowa. (Detailed information may be obtained from the State Society office). (See the New York STATE JOURNAL OF MEDICINE, March 15, 1930, page 368).

#### CIGARETTE ADVERTISING

Advertisements of cigarettes and cigarette holders have invaded medical journals as well as the daily newspapers and have aroused a considerable amount of indignation in many quarters. The Ohio State Medical Journal of April contains the following editorial on a bill proposed in the United States Senate:

"Tobacco and tobacco products will be included within the scope of the pure food laws if a bill presented by Senator Smoot of Utah and pending in Congress becomes a law.

"Senator Smoot's measure is an outgrowth of the advertising campaign cigarette manufacturers have been carrying on and which has been criticized by various organizations.

"The campaign of the tobacco interests was denounced by Senator Smoot as 'unconscionable, heartless and destructive attempts to exploit the women and youth of our country.'

"Ten years ago when in certain quarters of our metropolitan cities a saloon flourished on every corner, no tobacco manufacturer had the temerity to cry to our women: 'Smoke cigarettes—they are good for you,' Senator Smoot declared. When newspapers were filled with cure-all and patent medicine advertising, no manufacturer of a tobacco product dared to offer nicotine as a substitute for wholesome food; no cigarette manufacturer was so bold as to fly in the face of established medical and health opinion by urging adolescent boys or girls to adopt the cigarette habit.

"Not since the days when public opinion rose up in its might and smote the dangerous drug traffic, not since the days when the vendor of harmful nostrums was swept from the streets, has this country witnessed such an orgy of

ences over procedure in the treatment of sick paupers and payment therefor

2. Official Responsibility: The county society should seek first to establish the legal fact that the Iowa Statutes contemplate payment in full for all properly authorized medical services. (See Sections 5320 to 5334 of the Iowa Code).

3. The County Contract: Some mutually acceptable arrangement should be made between the county supervisors and the county medical society. There are several varieties of contracts covering such services which are now operating satisfactorily here in Iowa. (Detailed information may be obtained from the State Society office). (See the New York STATE JOURNAL OF MEDICINE, March 15, 1930, page 368).

#### CIGARETTE ADVERTISING

Advertisements of cigarettes and cigarette holders have invaded medical journals as well as the daily newspapers and have aroused a considerable amount of indignation in many quarters. The Ohio State Medical Journal of April contains the following editorial on a bill proposed in the United States Senate:

"Tobacco and tobacco products will be included within the scope of the pure food laws if a bill presented by Senator Smoot of Utah and pending in Congress becomes a law.

"Senator Smoot's measure is an outgrowth of the advertising campaign cigarette manufacturers have been carrying on and which has been criticized by various organizations.

The campaign of the tobacco interests was denounced by Senator Smoot as 'unconscionable, heartless and destructive attempts to exploit the women and youth of our country.'

"Ten years ago when in certain quarters of our metropolitan cities a saloon flourished on every corner, no tobacco manufacturer had the temerity to cry to our women: 'Smoke cigar-ettes—they are good for you,' Senator Smoot declared. When newspapers were filled with cure-all and patent medicine advertising, no manufacturer of a tobacco product dared to offer nicotine as a substitute for wholesome food; no cigarette manufacturer was so bold as to fly in the face of established medical and health opinion by urging adolescent boys or girls to adopt the cigarette habit.

Not since the days when public opinion rose up in its might and smote the dangerous drug traffic, not since the days when the vendor of harmful nostrums was swept from the streets, has this country witnessed such an orgy of

or special features on the program, and attractive announcements mailed a few days before the meeting, will help create interest in the programs and increase attendance.

III. Legislation, Politics: (A) Each county society should have a Legislative Committee, the members being selected for their interest

and activity in local politics.

- (B) A careful check should be kept on all pending medical and health legislation, and the attitude of the society should be communicated to the Legislative Committee of the state society, or, through the delegate, to the House of Delegates, where general legislative policies are determined.
- (C) Maintain a constant contact with candidates before primaries and elections: Know their attitudes toward health and medicine. Have the various candidates appear before the society prior to the election and discuss these matters with them, urging that they go to the state society Legislative Committee for professional advice in public health matters just as they go to a private physician in personal medical matters.
- (D) Work for votes for the right man: Every member of the society should take an active part. The county medical society can be the strongest single political power within the county, if its members will exert the tremendous influence they have.
- (E) During the General Assembly, let your legislators know by letter, telegram, telephone and personal words, that you are following their activities regarding health and medical legislation.

IV. Public Health: (A) Each county society should have a committee on public health activities or public relations, whose duties would

include:

1. Advising with all lay organizations engaging in any kind of health work, regarding their programs and activities.

- 2. Making recommendations to the society regarding approval (or not) of such lay health undertakings.
- 3. Investigating the possibility of a County Health unit as permitted by the new law on that subject.
- 4. If no other special committee exists for the purpose, the conduct of such lay educational measures (lectures, motion pictures, newspapers, etc), as are feasible within the county.
  - (B) Care of the Indigent Sick:
- 1. Sociological Aspects: This problem often estranges county officials and many citizens from the medical profession because of differ-

(Continued on page 485-adv xix)

#### RURAL PHYSICIANS

A new reason for the unwillingness of physicrans to go to rural districts is given editorially in the April issue of the Ohio State Medical Journal. After giving figures on the migration of physicians from the farms to cities the editorial says:

"Migration of the population is among the fundamental factors affecting the distribution of all lines of endeavor, including medical service

"A community's responsibility in the matter of supporting local enterprise was expounded some time ago in the editorial columns of Forbes:

"'During a discussion on the large number of small banks that had failed in the United States during recent years, one champion of mdependents as against chain or group banking remarked that in many cases it was the community rather than the bank that ceased to flourish,' the editorial declared.

"That was a pointed observation. The parcel

post, the automobile, the motor bus, the mailorder business, mass production, etc., have brought about an economic revolution, an evolution not always beneficial to small communities and local businesses. The decline in our rural population has naturally meant a decline in the number of rural business establishments. including banks.

"In other words, it is true that in many instances it was the community that failed,

"The point emphasized by Forbes applies also to medical services. As long as a rural community is financially able and willing to give physicians a financial return adequate to meet their needs and a fair return on their professional investment, the community need not worry about a shortage of medical services. In other words, medical services, like all other necessities of life, depend to a very large extent on the readjustment of economic conditions and on the basic principle of supply and demand."

## When convalescence drags along

Alka-Zane is a granular, effervescent salt of calcium, magnesium, sodium and potassium carbonates, citrates and phosphates. Dose, one teaspoonful

T is probable that acidosis is standing in the way. If there is anemia, poor oxidation of the blood is causing acidosis, and that in turn retards recovery.

Alkalization with Alka-Zane is worth trying. The results will be surprising.

Final decision on the true worth of Alka-Zane rests with the physician. We will gladly send a

twin package, with literature, for trial.

WILLIAM R. WARNER & COMPANY, Inc. 113 WEST 18th STREET NEW YORK CITY

## BASIC SCIENCE LAW IN MINNESOTA

The operation of the Basic Science examination required of candidates in all schools of healing in Minnesota is illustrated by the following item appearing in the April issue of Minnesota Medicine:

"Mrs. Kathryn Albers, 2527 Hennepin Avenue, Minneapolis, went on trial February 10, 1930, before a jury in the Court of the Honorable Gunnar Nordbye on a charge of practicing healing without a basic science certificate. The testimony disclosed that Mrs. Albers was using electrical appliances in giving treatments. Her defense was that she was exempted from the basic science law because she gave 'mental and spiritual treatments.'

"The Court ruled, however, that the kind of treatments given by the defendant was a question of fact for the jury, and after deliberating only twenty minutes, the jury returned a verdict of guilty.

"On February 13 Judge Nordbye sentenced the defendant to six months in the workhouse, and placed her on probation for one year. The defendant was given thirty days from that date in which to dispose of her equipment and get out of the business.

"In event she does not comply with the order of the Court, the defendant will have to serve her workhouse sentence.

"Judge Nordbye gave the jury a very splendid charge, and instructed them that the case was a very important one from the standpoint of the people in this State, and deserved the most serious consideration on the part of the jury."

## DUPLICATION OF OFFICERS IN NEBRASKA

The April issue of the Nebraska State Medical Journal has the following editorial on the duplication of officers in one person:

"With malice toward none and charity for all' the writer aims to point out a dangerous feature of the Nebraska State Medical Association, in vogue at the present time.

"It relates to the duplication and triplication of officers in one person. Scan the Roster of Officers on the last reading page and you will at once see that at least four members hold several offices and committee appointments. They are thoroughly capable and will do full justice to each and every position occupied by them. The point sought to be made, however, it that there should be a wider distribution of official duties among the membership to compel greater interest in organization work to forestall the inevitable charge of bossism,

(Continued on page 489-adv. xxiii)

(Continued from page 488-adv vxu)

centralization and czarism, if long continued "The Nebraska State Medical Association has never functioned better than at present and the general feeling toward the association has never been better—and every member wants this feeling to continue

"Many organizations have found it desirable to distribute official duties among as many of the membership as possible to gain wider interest and influence and our organization will do well to heed the policy of others and apply the principle to our own work. The more members put to work, the greater the association's influence and cohesion.

"The writer objects to nothing; he is pointing out a possible danger."

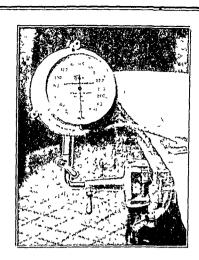

On turning to the page of officers we find listed 57 offices and committee positions, which are held by 45 individuals. One man, the Secretary-Treasurer, fills five positions; two men each fill three positions; and four men each fill two positions. This would seem to be a pretty good distribution of offices and committee assignments.

## DIAGNOSTIC SERVICE OF MENINGITIS IN MASSACHUSETTS

The New England Journal of Medicine for March 13 contains the following editorial on the detection of meningitis by means of a diagnostic service modelled after that of the City and State of New York:

"A consulting diagnostic service for epidemic meningitis under the auspices of the Department of Public Health and comparable with that now offered for polionyelitis by the Harvard Infantile Paralysis Commission marks a forward step in communicable disease control. Upon request of the attending physician, a representative of the Department will see a case of suspected meningitis with him, and if so desired will be ready to confirm the diagnosis by laboratory methods at the bedside.

"Every communicable disease presents special problems which must be met in attempting control. For diphtheria the State now offers free diagnostic laboratory service; this same service for meningitis must be available at the bedside. Attempts to check the spread of the disease have been notoriously discouraging but early diagnosis and treatment have materially contributed to a lowered fatality. It is hoped that through the proposed service diagnosic facilities comparable to those found in large hospitals."

## Tycos Surgical Unit

#### For Blood Pressure Determination in the Operating Room

For the convenience of anaesthetists and surgeons, who are finding that accurate blood pressure readings are invaluable during anaesthesia and surgery, we have designed this Tycos Surgical Umt.

It consists of a large easy reading type and a universal consist of a large easy reading type of a universal consistency of a universal consistency of any position of the way of the surgeons and assistants. The adjustments can be made instantly, but once made the instrument is firm as the table itself. If it is inconvenient to have the instrument attached to the table, the clamp will accommodate it to the anaesthesia equipment or instrument stand.

Modern trends make it extremely important for hospitals to include the Tycos Surgical Unit in their operating room equipment.

Your dealer can supply you with this equipment. Complete unit \$52.50. Clamp only \$15.00. Write today for additional information.

## PSITTACOSIS CONTROL IN MASSACHUSETTS

The relation of the Massachusetts Department of Health to psittacosis is well set forth in the following abstract of an article in the February 27 issue of the New England Journal of Medicine and labelled "From the confidential report of the Psittacosis Bureau of the Board of Health on the Psittacosis situation":

"The word psittacosis with superfluous consonants is serving to frighten many good people. It has jeopardized the lives of various harmless birds and has added unduly to the activities of the Board of Health in the midst of its busy season?

"The office telephones have been ringing with panicky calls for us to come and remove to places of safety parrots, parrakeets, macaws and even canary birds which have been suspected of being sick or accused of acting queerly. In fact, we have been somewhat panicky ourselves. We have been unable to think of ways to avoid making personal investigations when somebody has telephoned that he thought that he or a neighbor might have a sick bird dangerous to the public health. We did not know what excuse to make when reminded that there were parrots in barber shops and it was pointed out that the Board's Regulations governing sanitation and conduct of barber shops prescribed no rules or precautions whatever for the protection of barbers or their patrons against psittacosis.

"Other places were advertising their cases of psittacosis and our silence about psittacosis was threatening to undermine public confidence in our ability to secure free advertising. There was danger, too, that someone might begin to suspect that an unpleasant situation had developed for which the Board of Health did not stand ready with effective relief.

"A vociferous apparently healthy Colombian parrot secured some weeks before in New York by a local dealer was inspected at the dealer's place here on several occasions before the purchaser finally decided to pay the dealer's price. Upon purchase, the bird was shipped by express to the purchaser's family on a certain date. Four days later, the bird died. Two days afterward, one member of the family and seven days later, another member of the family had become definitely sick with what was reported to be psittacosis.

"We do not question the diagnosis. The dead parrot was returned to the dealer here, who acceded to the demand of the purchaser for the return of the money and consigned the parrot's remains to an ash can, the contents of which had disappeared before either the dealer or we had heard of sickness in the purchaser's family. The dealer had about fifteen other parrots, none of

which have shown signs of sickness before or since.

"The Psittacosis Bureau has acquired a great deal of information regarding parrots. Every place where birds are known to be or suspected of being offered for sale has been inspected and the proprietor questioned and then cross-examined. Ornithologists and pathologists have been quizzed. Bird attendants in our Parks have been consulted. We have learned to recognize the different varieties of parrots. We can now tell from whatever locality anywhere in the world any particular bird comes by examining his plumage. We know how parrots are caught, brought here and marketed. We are being buoyed up by the hope that some day all this information may prove valuable.

"Thus far, however, we have failed to discover a case of sickness here among birds or human beings which could judiciously be advertised even

as a suspected case of psittacosis.

"We feel, however, that the public may be safely told that a parrot which contracts psittacosis quickly shows plain, unmistakable evidence of being a very sick bird. Among the symptoms, it probably has a green diarrhoea, but we suspect that a parrot may have a green diarrhoea from other causes.

"A human being which becomes infected with psittacosis likewise develops very rapidly symptoms which make the serious character of the illness so obvious that a call for a physician is not likely to be long delayed.

"Psittacosis does not come on insidiously. A person is not justified in entertaining murderous feelings toward the family parrot, which has not associated with other birds for thirty years,—or even for thirty days,—just because the parrot seems to be less noisy than usual or appears to be losing its appetite.

"Psittacosis is not an imaginary disease as some of our citizens believe rabies to be. Psittacosis is a serious disease for any human being who may happen to get infected, but from the point of view of danger to the public even a recently imported parrot is not in the same class as the family dog, with rabies increasing in prevalence as it is in this vicinity. The mortality from rabies is 100 per cent. Moreover, the control of rabies is a difficult problem, while the prevention of psittacosis is easy. Among other ways of practically eliminating human danger from psittacosis is that of subjecting consignments of birds to a brief period of quarantine, either at our ports of arrival or under consular supervision at tropical ports of departure."

## **CROOKES COLLOSOLS**

The original colloidal and non-ionic preparations for medicinal use

A wide range of these important additions to therapeutic resources is now available. As upwards of 250 published references to the clinical efficiency of the products have appeared in authoritative British medical journals and text books, they merit close investigation by every practitioner.

The Collosols available include

COLLOSOL ARGENTUM COLLOSOL MANGANESE

COLLOSOL IODINE
COLLOSOL SULPHUR

COLLOSOL KAOLIN
COLLOSOL TRIMINE

Full particulars and clinical samples will be sent on application to

## ROUND-UP OF SCHOOL CHILDREN IN MICHIGAN

The April issue of the Journal of the Michigan State Medical Society has an article on the State Health Department in which the Commissioner describes the summer round-up of school children as follows:

"Many communities, and physicians, know from experience the aims and plan of conduct of the Summer Round-Up of the Children. It is an activity of the Congress of Parents and Teachers, begun in 1925 and now one of the most important projects of that organization. Its general purpose is to have an examination made, during the summer, of all children who are to enter school for the first time in the fall, and to have remediable defects corrected.

"The Michigan Department of Health works closely with the Michigan Congress of Parents and Teachers in coordinating the activities of the local associations. Every effort is made to see that they are carried on in accordance with recognized public health procedure.

"The summer program has already been launched in Michigan, by a letter from the State President of the Michigan Congress of Parents and Teachers to the Presidents of all County Medical Societies."

#### MEDICAL NEWS GATHER-ING IN TEXAS

The collection of medical news by State Medical Journals is a universal problem throughout the nation. The February issue of the Texas State Journal of Medicine says editorially:—

"Since the beginning of its publication, the Journal has maintained a department in which to publish the current news of special interest to the medical profession. We deem this an important matter for two reasons: first, we desire to

A well known Urological Journal says:

"If you must use a diuretic, try the best —water"

This recommendation is well worthy of adoption especially

# Itoland Water

is used. ¶ Physicians have commented favorably on its bland diuretic properties for over 60 years.

## POLAND SPRING COMPANY

Dept. C 680 Fifth Avenue New York City make sure that our readers be informed; second, we desire to make a permanent record of current affairs of interest to the future student of medical history. So far our principal source of news has been clippings from the newspapers, through a clipping bureau. We are not any too successful in our quest through this channel, and we have not been able to induce our readers to co-operate to any considerable extent.

"It is not possible for the Journal to establish a complete, effective, news-gathering organization, for obvious reasons. We have had to depend upon our readers for help by way of cooperation, and must for some time, at least, continue to do so. We are asking now, quite earnestly, that such co-operation be vouchsafed."

#### DRUG STORE BUSINESS

Doctors often wonder what drug stores sell. The question is answered in the April issue of the Ohio State Medical Journal which says:

"As evidence of the size and importance of the merchandising problem which retail drug stores are now facing Drug Topics cites the following percentages to show how the two billion dollar drug store business of the country is distributed among the various commodities:

"It would seem after a glance at these figures that almost no drug store today can hope to meet real competition unless it is prepared to make a department store and a restaurant out of itself, as well as a place where healing medicines can be purchased."

## Dr. Barnes Sanitarium STAMFORD, CONN.

A private Sanitarium for Mental and Nervous Diseases. Also Cases of General Invalidism. Cases of Alcoholism Accepted.

A modern institution of detached buildings situated in a beautiful park of fifty acres, commanding superb views of Long Island Sound and surrounding hill country. Completely equipped for scientific treatment and special attention needed in each individual case. Fifty minutes from New York City. Frequent train service.

## Cholecystography

This photograph shows the correct positioning and accessory apparatus for cholecystography. Below are details of the proper technic used with Wappler Valve Tube Rectifier Apparatus.

For cholecystography, the Wappler Monex, the Wappler Diex or the Wappler Quadrex, are especially efficient. All are characterized by ample power, silent and rapid operation and the ease with which results may be duplicated.

The Monex is widely used for radiography and fluoroscopy, also by dermatologists for superficial skin therapy. The Diex, of greater power, is used for radiography, fluoroscopy and intermediate therapy. For ultra-rapid radiography and fluoroscopy, the Quadrex is remarkably efficient. For massive dose deep therapy, the Quadrocondex is unequalled.

¶ Write for Booklet VT-G, fully describing and illustrating Wappler Valve Tube X-Ray apparatus.

## Pregnancy: Prenatal Care

As a prophylactic from date of declaration to term, the use of Kalak Water affords the patient a dependable defense against abnormal conditions that may be manifested as a result of mineral depletion.

Presenting a fully saturated solution of calcium as the bicarbonate, Kalak Water helps to supply the need of the patient for this essential base.

Kalak Water Company
6 Church Street New York City

## DIET OUESTIONS have GELATINE ANSWERS

## VARYING THE MONOTONY OF THE LIQUID AND SOFT DIET!

Most physicians-and patients-will agree that for cheerless monotony nothing quite equals the liquid and soft diet. But medical science now knows that it is no longer necessary to confine the patient strictly to a tiresome broth, milk and egg-nog regime.

Pure, granulated unflavored gelatine-for example, Knox Sparkling Gelatine-has been found of inestimable value in varying the liquid and soft diet while at the same time supplying the essential elements of nutrition.

Pure gelatine prevents precipitation in the presence of acids or salts - as in the digestive juices -and is itself digested and absorbed with minimum effort. Knox Sparkling Gelatine has a food value of approximately 120 calories per ounce or 4.3 calories per gram. Care should be taken, however, to insure that the gelatine used is the real, unflavored, unsweetened, unbleached gelatine-in other words, Knox Sparkling Gelatine.

Please notice the attached coupon. If you will mail it we shall be glad to send you data prepared by one of the country's leading dictitians on how to prepare attractive, palate-tempting dishes with Knox Gelatine in correct caloric proportions.

## When Your Diagnosis of Malignancy Has Been Confirmed We Can Help You

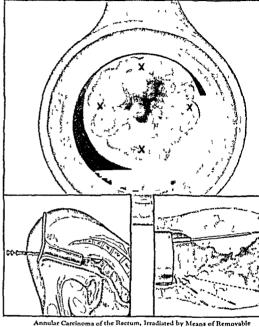

UIETLY, but effectively, The Radium Emanation Corporation has been administering the radium needs of America's most prominent physicians since 1922.

We offer you the same technical counsel, the same extraordinary radium laboratory facilities that have made it possible for surgeons, gynecologists and urologists throughout the United

States and Canada to reinforce their own efforts in behalf of the patient afflicted with cancer.

Very definite changes have taken place in the art of radium therapy. The "hazard and hope" methods of earlier days have been abandoned in favor of a new, more scientific technique, which has completely changed the attitude of the entire medical fraternity towards the surgical use of radium, and radium therapy is rapidly becoming an indispensable element in the armamentarium of every surgeon, gynecologist and urologist.

The Radium Emanation Corporation has contributed in large measure to this modern trend in radium therapy. It gave the medical profession the Removable Platinum-Radon Seed which has made possible so many of the unparalleled results reported recently in the medical press. Through its radium therapy consultants, The Radium Emanation Corporation sponsors the most advanced methods in radium therapy and makes radium available to the individual physician according to the requirements of his particular case.

Carcinoma of the Rectum, Irradiated by Means of Removable Platinum-Radon Seeds, Without Radical Surgery

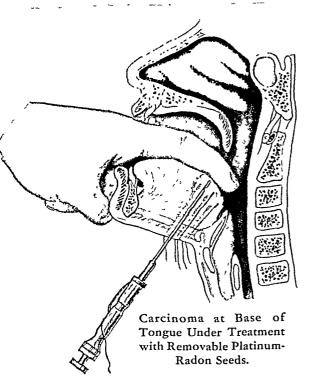

We have only one ideal-to help you obtain better results in the treatment of your malignant cases.

If you have malignant cases, for which you are considering treatment, investigate this unique service. Let our radium therapy consultants collaborate with you in the solution of your problems They will gladly give you the benefit of their own broad experience and you may have their opinion and recommendations without incurring the slightest obligation.

> Send us a history of the case and you will receive immediately a carefully considered plan covering the application of radium

The type of service we are giving the medical profession will amaze you, unless you are one of the hundreds of physicians whose radium needs we are already administering

> CORPORATION THE RADIUM EMANATION NEW YORK CITY Graybar Building at Grand Central Terminal

## Now Every Hospital Can Have Radium

Without Capital Investment or Administrative Expense

made adequate provision for supplying the regular or emergency radium needs of hospitals, both large and small, wherever located, at moderate cost. All departmental requirements are quickly and efficiently met and the radium is prepared according to the requirements of each individual case. Instruments and other surgical equipment necessary to properly apply the radium are always provided. If it is desired our radium therapy consultants will collaborate with department chiefs until such time as radium therapy becomes well established as a part of your equipment.

Such a service insures the immediate availability of adequate quantities of radium for every need, without the investment of capital or expense of administration.

We invite correspondence with hospital executives concerning this unique service.

## We Prepare Radon for Use at Distant Points Without Loss to the Customer

Physicians familiar with the physical characteristics of radon sometimes ask us how we effect deliveries to distant points without loss to the customer. Every applicator which leaves our laboratory has been prepared so that it will contain the precise amount of radon required at the time of use, even though delivery must be effected at a point three thousand miles from New York City. Physicians and hospitals along the Pacific Coast use our service regularly and enjoy the same economies as those located at intermediate points.

## Special Service Features

With a large active staff in addition to the medical personnel, we offer the medical profession the facilities of the following divisions of our organization:

Post Graduate Courses in Radium Therapy.

Radium Emanation Equipment—Design, Erection and Maintenance.

Library Research. Abstracting. Editing of material for text-books or special papers on medical subjects.

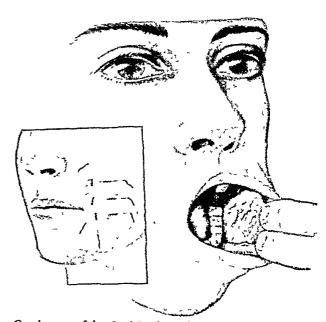

Research. We are prepared to undertake any problem requiring the services of consulting physicists or chemists.

Translations. All languages.

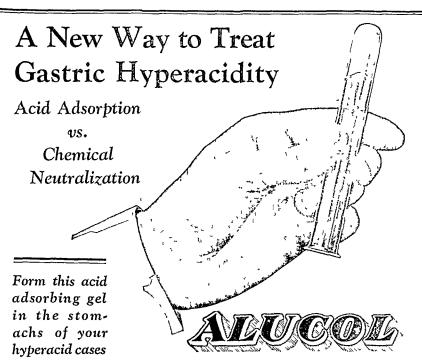

Medical Illustrators. Our medical artists are available for the preparation of anatomical drawings, in full color or in black and white.

Ask for a copy of THERADON, the Monthly Bulletin of our Medical Department, a publication devoted exclusively to methods and technique in the art of radium therapy.

(COLLOIDAL HYDROXIDE OF ALUMINUM)

THE introduction of ALUCOL—a true colloidal type of hydroxide of aluminum—by the Wander Research and Chemical Laboratories marks a new advance in the treatment of gastric hyper-acidity.

ALUCOL acts by colloido-chemical adsorption, not by chemical neutralization. It combines colloidally with the excess of gastric HCL to form a colloidal gel in the stomach. This gel acts as a carrier of the excess of acid and removes it from the system.

As ALUCOL does not neutralize the acid, it does not hinder or prevent proteolytic activity.

Clinical reports show ALUCOL to be remarkably effective in gastric and duodenal ulcer and other conditions characterized by high gastric acidity.

# Diathermy for generating heat within the tissues

Anything short of major calibre in a diathermy machine will prove disappointing. The Victor Vario-Frequency Diathermy Apparatus is designed and built to meet every requirement. It has, first, the necessary capacity to create the desired physiological effects within the heaviest part of the body; secondly, a refinement of control and selectivity unprecedented in high frequency apparatus.

ABUNDANT evidence of an increasing use of diathermy in therapeutics is offered though a perusal of the outstanding periodicals in the medical library.

The widely varying applications of this form of heat, indicates also that almost every physician, whether in general or specialized practice, will find this energy of inestimable value in some conditions met with almost daily. Many of these clinical reports cite unsually stubborn conditions, of long standing, which have yielded to intelligent use of diathermy, with results gratifying to physician and patient alike.

# Quick Relief

Not only does the balanced

antacid, BiSoDoL, afford quick relief to the well known symptoms of gastric hyperacidity, but it introduces a control factor against the setting up of a dangerous alkalosis—a chief objection to single alkali medication.

In BiSoDoL the sodium bicarbonate, being soluble, is immediately neutralized. However, as soon as neutralization has been established, magnesium carbonate serves as a control. It remains incrt until a rise in the acid content of the stomach activates this neutralizing property. The two salts maintain the balance of normal reaction in the stomach, and correct abnormal deviations.

BiSoDoL has been found effective in controlling cyclic vomiting, the morning sickness of pregnancy, and alkalinizing against colds and respiratory affections.

In the formula are included bismuth subnitrate, antiflatulents and flavorings which enhance its value and render it acceptable to the patient.

> Advertised solely to the medical and allied professions.

# Iction of NEUTRA

A synthetic aluminum silicate with about twelve per cent sodium silicate

DOSAGE: The usual dosage of Neutralon is a teaspoonful stirred in half a glass of water three times daily, before meals when the protective and astringent action is required, and after meals as an antacid.

#### ORIGINAL PACKAGES:

NEUTRALON

Boxes containing 50 and 100 grams.

Belladonna-Neutralon

Boxes containing 100 grams.

### Belladonna-Neutralon

is Neutralon with the addition of 0.6% extract of belladonna.

Neutralon has a twofold antacid effect, a siight immediate effect through the action of the soluble sodium silicate component and a slow prolonged effect through the decomposition of the insoluble aluminum silicate which converts free into combined acidity.

### Astringent\_

The aluminum chloride formed by the reaction of Neutralon with the acids of the stomach acts as a mild astringent, thus tending to limit gastric secretion.

## Adsorptive

Neutralon and the silicic acid adsorb albumen and pepsin so that the harmful digestive action of pepsin on the ulcerated wall of the stomach is hindered.

## Protective and Analgesic

Unchanged Neutralon and the silicic acid formed during the course of the reaction tend to form a coating on the ulcerated wall of the stomach, thereby affording protection against mechanical and chemical irritation.

Sample and literature upon request

## Bi-Terminal Technique in Tonsil Electro-Coagulation

ANEW and greatly improved method of electro-coagulation of tonsils, introduced by Dr L. L. Doane, Butler, Pa Hitherto the mono terminal method where the active electrode or needle, is embedded in the tonsil and the indifferent electrode held in the hand of the patient, or applied to some other point has been found to produce more or less frequently edema of the pillars and adjacent tissues, due to the passage of the heavy current necessary for coagulation from the active to the indifferent point.

With Dr Doane's Bi terminal technique a mild, low voltage current suffices due to less tissue resistance rapidity of effect and shorter operating time The current is practically confined to the operating field hence more easily controlled

## THYROID DISEASES, THEIR CLASSIFICATION AND TREATMENT\* By J. WILLIAM HINTON, M.D., F.A.C.S., NEW YORK, N. Y.

TO ARRIVE at a definite diagnosis of thyroid diseases one must first consider the different types of goiter which are generally found. First, Adolescent Goiter; second, Colloid Goiter; third, Adenomatous Goiter, with or without hyperthyroidism; fourth, Exophthalmic Goiter or Grave's disease; fifth, malignant tumors of the thyroid. The rarer conditions of the thyroid including tuberculosis, gumma, acute pyogenic infection and hypothyroidism, or myxedema, will be excluded.

Normal Thyroid Histology.—One is lead to believe that the histological findings for normal individuals of relative ages are more or less constant, the gland being made up of acini which may vary in size but the lumen being filled with colloid. The epithelial cells are either cuboidal or flattened. Although the acini may vary the cells lining same are constant for the same individual. In reviewing sections from people whose deaths were accidental, one is led to question what constitutes a normal histological picture, but it seems certain that histological findings vary considerably with age.

Adolescent Goiter .- This is taken to represent the goiter which occurs during puberty, or be-tween the ages of 10 and 16. This is usually seen in females and the physical examination is negative, except for a definite enlargement of the thyroid gland which involves the entire gland with the absence of nodules, or irregular masses. The basal metabolism is normal and the other laboratory tests are of no diagnostic aid. Goetsch or adrenalin test may be of some aid in ruling out hyperthyroidism in an adolescent goiter. The acini are enlarged and dilated and full of colloid, with the lining epithelial cells somewhat flattened and compressed. The interstitial tissue is considerably diminished, all of which indicates a state of inactivity of the gland, and this is one type of goiter which is supposed to be due to iodin deficiency.

Treatment.—This type of goiter in the early

\*Read before the Richmond County Medical Society, St. George,
Staten Island, New York, June 12, 1929.

stages is a medical problem and attention should be given to the general hygienic condition of the patient, correcting any foci of infection which may exist, and administering iodin and thyroid medication. I personally have seen better results from thyroid medication than from iodin, regardless of the form in which it is given. One-half grain of thyroid extract, T. I. D., is usually prescribed, and this is discontinued for one week in each month, the dosage being increased if necessary, until the patient receives 1 to 1½ grains, T. I. D. It is generally stated that iodin and thyroid extract do not produce injurious effects in this type of goiter but I wish to take exception to this teaching and report the following case.

A female 16 years of age was examined in June, 1928, on being discharged from an orphanage and was found to have an adolescent goiter. She did not know this existed until informed by the examining physician who advised her to take two drops of tincture of iodin in water daily. This she did for two months after which time she became quite nervous and had tremor of her hands. The iodin was discontinued but the patient showed no improvement and was first seen by me on November 20, 1928, in the goiter clinic at St. Mark's Hospital. Examination revealed a definite enlargement over the thyroid, with a thrill and marked tremor of hands, and the patient was extremely nervous and restless. Basal metabolism done November 24 was normal. She was advised to remain out of school and put on a high coloric diet and forced fluids, with clixir luminol drams 1, T. I. D. Next seen on January 22, 1929. During this time the patient lost six pounds in weight and her condition instead of improving became worse. Hospitalization was advised and her basal metabolism done on January 24, 1929, was a plus 3. After being put on Lugol's solution, minims 20, luminol grains, 11/2, ovarian substance grains, 5, and pancreatic substance grains, 2, T. I. D., the patient showed marked improvement. Thyroidectomy was done January 30, 1929, and the patient made an uneventful recovery. Pathological diagnosis, exophthalmic goiter.

Colloid Goiter.—This is supposed to represent a more advanced stage of adolescent goiter which occurs in adults between the 18 and 30 year. In a colloid goiter the acini are much more dilated and the epithelial cells flattened from compression with very little interstitial tissue between the acini. Colloid and adolescent goiter really represent one and the same condition, and there should not be a separate classification for the two conditions.

Treatment.—In this type of goiter iodin or thyroid medication is indicated. The prognosis depends on the duration of the disease. If the condition has existed for one or two years the prognosis should be very guarded, as the response is practically in proportion to the duration of the disease. A colloid goiter is supposed never to become toxic, and it is stated that injurious effects are not seen from prolonged iodin br thyroid medication. I wish to take exception to this statement also and report the following case.

Female 33 years of age stated that in September, 1927, she consulted her family physician for a swelling of her left ankle and a goiter. At that time she was found to have a phlebitis of the left ankle. On communicating with Dr. Felder, her family physician, I found the patient had had a colloid enlargement of her thyroid, without symptoms. She was not given any thyroid or iodin medication but five months later, as her mother had died from an exophthalmic goiter, she consulted a thyroid specialist in New York, for she was rather conscious of the slight fullness in her neck. There were no symptoms referable to the thyroid at that time. Basal metabolism done on February 4, 1928, revealed a minus one. She was informed that she had no thyroid disturbance but was given Lugol's solution, minims 3, T. I. D. Three months later she had lost 8 or 10 pounds in weight, her eyes were enlarged and she was nervous and quite irritable, and bothered with palpitation. She consulted another physician who told her she had Grave's disease. The patient was given iodide of mercury, grains 1, O. D., and advised to have x-ray She received several treatments and showed improvement but four months later, not feeling entirely well, she consulted Dr. Carter, at which time her weight was 118 pounds, as against her best weight of 136 pounds. Basal metabolism done on October 27, 1928, was 3 below the average normal. I saw this patient in consultation with Dr. Carter on October 28, 1928, at which time there was definite evidence of a thyroid enlargement with a thrill over same and it was quite apparent that the patient was suffering from an exophthalmis goiter. Thyroidectomy was performed on November 5, 1928, at Post-

Graduate Hospital, by Dr. Carter. Pathological diagnosis, exophthalmic goiter in resting stage.

The above findings are not unusual in the adolescent and colloid types of goiter and Hertzler\* who has been greatly responsible for clarifying the state of confusion in thyroid diseases states: "It was only after an accumulation of hundreds of specimens which presented unmistakable microscopic evidence that the goiters were of long standing that it occurred to me that something could be gained by securing a careful history covering the period antedating the time of the alleged origin of the goiter. Since going further back than the suggested date in the history, it is uncommon to find patients with an alleged sudden onset of the condition who do not give evidence of disturbances antedating the time given." And Hellwig<sup>3</sup> also states: "I am forced to the belief that exophthalmic goiter develops usually in a diffuse colloid goiter." . . . "Likewise the distinction usually made clinically between innocent colloid and exophthalmic goiter does not seem to be justified, since the diffuse colloid goiter, at least the proliferating form, is often associated with slight symptoms of hyperthyroidism."

Adenomatous Goiter.—This is the nodular, or asymmetrical type of goiter which is first seen during the child-bearing period, between the ages of 20 and 30, and which may increase in size if there are several children born in rapid succession, although it may not enlarge or produce any symptoms which are referable to a goiter for 15 or 20 years, or approximately until the menopause. On the other hand it may make its first appearance during the menopause, at about the age of 45, in which case the symptoms are not produced until 60 or 65 years of age. Much confusion has arisen as to the diagnosis of this type of goiter and it is the one which is generally poorly treated, and the patient misinformed as to facts. In a high percentage of goiters diagnosed as adenomatous, the goites are really col-There is only one origin for an adenomatous goiter and that is from a fetal adenoma which has remained dormant in the thyroid since intra-uterine life, and which supposedly develops due to thyroid deficiency in the pregnant mother. This is a tumor of the thyroid, with the acini small and closely placed in one section and a fibrous capsule separating normal thyroid tissue. If we are to follow the teachings of some clinics, this type of goiter is always the same and is never interchangeable. The following cases will illustrate how difficult it is at times to differentiate between an adenomatous goiter, exophthalmic goiter and colloid goiter.

First case, a female 38 years of age, a nurse, was first seen by me on August 4, 1927, stating that 12 years previously she had been operated upon for an adenoma of the isthmus of the thyroid. About one year after this operation she

noticed a lump in the right side of her neck. This had increased slightly in size and about seven weeks before consulting me she had a gastrointestinal upset from eating sea food. Since that time she had lost 20 pounds in weight and had palpitation of her heart and shortness of breath on going up stairs. Otherwise she felt well. Her menstrual periods had been scanty during the last few months. Examination revealed no evidence of exophthalmos in the right eye, the left having been enucleated following an accident at the age of two years. At the time of examination there was a nodular mass involving the right lobe without a thrill and her pulse was 108. A diagnosis of adenoma of the thyroid with hyperthyroidism was made. Basal metabolism done on August 5 was a plus 45. Patient entered Post-Graduate Hospital and was operated upon on August 22, 1927. She made an uneventful recovery, being discharged from the hospital on August 30. 1927. Pathological report: hyperplastic goiter of Grave's type, in a stage of slight remission at the time.

Second case, female 26 years of age, first seen by me on November 30, 1927, complaining of a swelling in her neck which she had had for one year. Friends first noticed a lump in the right side of her neck but at that time she had no symptoms referable to her goiter. Occasionally a sensation of pressure and choking was noticed but otherwise she felt perfectly well. General physical examination was negative with the exception of a definite mass involving the right lobe The left lobe was negative. of the thyroid. Weight 13334 pounds, pulse 100. Diagnosis of adenoma of the thyroid was made and basal metabolism done on December 2, 1927, was a plus 3. Patient was informed she had the type of goiter that could not be treated by medication, but as I had treated her sister for a colloid goiter with a satisfactory result, she demanded medication before submitting to an operation; hence she was put on thyroid extract, grain 1, T. I. D. The patient was next seen on January 18, 1928, at which time her weight was 13734 pounds and pulse 90. She had no complaints but her neck remained unchanged and she was given thyroid extract, grains ½, T. I. D. On March 21, 1928, she returned stating she had had nausea and vomiting and had been bothered with diarrhea for two weeks and was beginning to feel ill. complained of nervousness and palpitation and was losing weight. Examination revealed an enlargement over the thyroid region with a definite thrill over same, and a beginning exophthalmos. Patient entered Post-Graduate Hospital on March 22, 1928, for observation and operation. Basal metabolism done on March 26, 1928, revealed a plus 60. Weight 105 pounds and pulse 160. Patient was operated upon on April 2, 1928, and made an uneventful recovery. Pathological report: exophthalmic goiter in the stage of remission.

Third case, female 26 years of age, admitted to Post-Graduate Hospital on August 30, 1926, stating that she had been bothered for two years by swelling of her neck. Her neck had always been full but two years previously she noticed it was getting larger and with the increase in size came added difficulty in swallowing. There was no sweating, tremor of hands, diarrhea or palpitation. Examination revealed a well developed and nourished woman not appearing all. The neck revealed an enlargement of both lobes of the thyroid, the right lobe being larger than the left. There was a definite encapsulated mass in the right lobe. No thrill or exophthalmos was found, and the pulse was 90. Basal metabolism done August 31, 1926, was a plus 4. Diagnosis: diffuse adenomatous goiter. Thyroidectomy was done September 4, 1926. Pathological report: exophthalmic goiter in stage of remission.

It is difficult to make a definite diagnosis of adenomatous goiter, and the teachings have been that any nodular or asymmetrical growth represents the adenomatous type, but the above cases tend to disprove these teachings and Rienhoff<sup>8</sup> explains the error in diagnosis in this type of case. He states "From the evidences at present, it would seem that most of these tumors palpable in nodular goiters are nothing more than involutional bodies of the same type as have been described above, and that a great many, in fact, nearly all of the cases of nodular goiter with or without hyperthyroidism which have been described as colloid adenomas, mixed fetal and colloid adenomas, colloid cysts, cystic adenomas and miliary adenomas, are in no sense of the word adenomatous but the result of an attempt on the part of the thyroid gland, following an hypertrophy, to reapproximate its normal histologic structure, namely, involutional bodies or areas of hyperinvolution and hypo-involution."

The treatment of adenomatous goiter can be briefly summed up. Thyroid and iodin medication is never indicated, if a correct diagnosis is made, because you are dealing with a tumor which involves the thyroid gland, and it is useless to expect any improvement from any form of medication under such conditions, as medicine can only invite trouble. It is well to bear in mind that this is the type of goiter that develops into malignancy of the thyroid and it is estimated that from 2% to 5% of adenomas will take on malignant degeneration, which is the one reason for an early removal of same.

Exophthalmic Goiter, or Grave's Disease.—In this type of goiter with its classical signs and symptoms of tachycardia, tremor, exophthalmos and swelling of the neck, the diagnosis is not difficult. But with the use of iodin, thyroid extract and x-ray therapy, one faces an entirely

different problem, and here the secondary rather than the primary signs and symptoms are really of most importance. I refer to the loss of weight, ravenous appetite, menstrual irregularities and amenorrhea, also the ability of the patients to stand cold weather more comfortably than formerly, and their inability to stand hot weather. This, of course, is due to excessive heat production. Other symptoms are perspiration of hands and feet, flushing of skin, and giving away of the knees. In this type of goiter the acini vary in size with infolding of the epithelium which is of high columnar type, and the acini contain very little colloid in the lumen which indicates marked activity of the thyroid gland. This type of goiter is supposed to represent a distinct clinical entity. with constant histological findings. The following cases will serve to illustrate that the histological and clinical findings are not always constant.

First case, female aged 26, first seen on January 17, 1928. She had been very nervous and irritable for the past year. In February, 1927, she began to have trouble swallowing, and at that time consulted a physician who gave her iodin to take, but after six weeks of non-improvement she consulted another physician who gave her nine x-ray treatment. After this still another physician gave her violet ray treatment and did a tonsillectomy, and also gave her medicine for her nervousness. She continued on this treatment until November, 1927, when being still unimproved the patient discontinued all treatment. Examination revealed a definite tremor of hands with slight exophthalmos, slight enlargement over thyroid with a thrill, weight 118½ pounds, as against her best weight of 148 pounds, and pulse 140. Basal metabolism done on January 25, 1928, revealed a plus 14. Diagnosis: exophthalmic goiter. Patient entered Post-Graduate Hospital for observation and operation on January 24, 1928, and was operated upon on January 30. Pathological report: colloid goiter of unusually homogenous structure.

Second case, female 19 years of age, first seen April 26, 1927, complaining of palpitation of her heart, swelling of neck, enlargement of her eyes, extreme nervousness and loss of weight for a period of four months. She had been taking medicine including iodin which seemed to make her feel worse. Examination revealed a slight exophthalmos with a definite fullness over the thyroid and a thrill, with tremor of fingers and Best weight 130 pounds, present moist skin. weight 1173/4 pounds, and pulse 140. Diagnosis: exophthalmic goiter. On April 26, 1927, the patient entered Post-Graduate Hospital for treatment and operation. Basal metabolism April 28 a minus 4. Operated upon on May 4, 1927. Pathological report: colloid goiter.

Third case, female 44 years of age, entered Post-Graduate Hospital June 2, 1927, complaining of nervousness, tremor of fingers, swelling

of neck and protruding eyes, from which she had suffered for a period of five years. Her symptoms came on following the death of her daughter from pneumonia. The patient had had a cholecystectomy and appendectomy 10 years previous to the time she consulted me; otherwise her history was negative. Examination revealed bilateral exophthalmos with symmetrical swelling of thyroid and thrill over same. Heart was fibrillating and pulse could not be counted accurately. Basal metabolism done on May 28, 1927, was a plus 69. Weight 157 pounds with pulse 150. Patient was operated upon on June 11, 1927. Pathological report: exophthalmic goiter in a resting stage, with two small adenomata.

The work of Marine and Williams<sup>5</sup> proved that this type of goiter could be changed into the colloid type by iodin administration. In 1908 they reported four cases clinically regarded as exophthalmic goiter of the mild type which had, however, been treated with iodin, and were all anatomically pure colloid goiter, and they state there is a return to the colloid type on the administration of continued minute doses of iodin, even in exophthalmic hyperplasia. But Plummer in 1922 introduced iodin in the form of Lugol's solution for pre-operative use in patients suffering from exophthalmic goiter. He differentiated between adenomatous goiter with hyperthyroidism and exophthalmic goiter, with the understanding that Lugol's solution was specific for the exophthalmic type but not in the adenomatous goiter. His views were generally accepted until Graham<sup>1</sup> in 1926 published the results of his work which revealed that Lugol's solution was effectual in reducing the thyrotoxicosis and metabolic rate in both the adenomatous and exophthalmic types and stated: "It is a matter of considerable importance to recognize that the quantity of iodin necessary to bring about the same or comparable clinical response and decrease of basal metabolic rate is much less in cases of toxic adenoma than in cases of exophthalmic goiter. This we attribute to the difference in degree of hypertrophy and hyperplasia of the thyroid in the two conditions." offers a very satisfactory explanation for the temporary improvement following iodin administration in cases of hyperthyroidism. He states: "When iodin is first given the cells are stimulated to secrete an excessive amount of colloid. colloid fills the acini and mechanically compresses the lining cells, thus reducing their secretory power. Less thyroxin is produced, and the patient shows clinical improvement. Gradually the cells adjust themselves to the changed condition and resume their secretory power. The amount of thyroxin is thus again increased and the toxic symptoms increase proportionately. iodin medication fails to alter the production of thyroxin, but does continue to stimulate colloid production. After prolonged iodin administration the cells become exhausted, can no longer produce colloid, and on continual iodin stimulation they degenerate. However, even in the stage of exhaustion, they are still quite capable of carrying out their pathological function, i.e., production of excessive amounts of thyroxin. microscopic picture, which is usually interpreted as a specific effect of iodin on the thyrotoxic producing properties of the cells, is in reality the effect of prolonged and excessive colloid production."

Treatment,-Since the introduction of Lugol's solution as a pre-operative medication, it is generally conceded that a thyroidectomy will restore these patients to a normal state of health with the shortest period of disability and the greatest chance of a permanent cure.

Malignant Tumors of the Thyroid,-Malignant tumors of the thyroid are from 90 to 95 per cent carcinoma so my remarks will be confined to carcinoma. Graham2 has given us a clear clinical and microscopic description of carcinoma of the thyroid and my remarks will follow his teaching. There are three types of carcinoma of the thyroid: First, Scirrhous; second, Papillary adenocarcinoma; third, Malignant adenomatous goiter.

Scirrhous carcinoma is rarely seen and usually arises in a thyroid without any pre-existing goiter, and the history is of short duration. Microscopically it resembles a scirrhous carcinoma of the breast. This type of malignancy does not invade the blood vessels and does not metastasize to distant organs, but spreads by direct extension, and is usually found invading the trachea, larynx and esophagus. Due to its invasion of the adjacent structures there is no clinical cure in this type of carcinoma.

Papillary adeno-carcinoma is the type of carcinoma which usually is associated with a pre-existing adenomata and usually metastasizes to the adjacent lymph nodes through the lymphatics, and does not invade the blood vessels or metastasize to the distant parts of the body.

The following case, a female 38 years of age, married and with three children, 13, 11 and 8 years of age, was first seen February 4, 1928. She stated that after the birth of her last child eight years ago she noticed an enlargement of her neck, being 30 years of age at the time. Three years later she went to a hospital where a basal metabolism test was done and she was given medicine to take. She did not show any improvement and discontinued treatment. About one year ago she noticed difficulty in breathing and sale indicated in oreatining and inability to sleep lying prone, and was forced to sleep propped up. Patient was operated upon thalmic Goiter. Archives of Surgery, September, 1926

agreed .

on February 17, 1928, at Post-Graduate Hospital. Low collar incision was made, skin flaps dissected back, muscles divided in midline and found adherent to a firm mass which involved the isthmus and entire left lobe of the thyroid. Clinically the mass was a definite carcinomatous growth involving the entire left lobe. The left lobe was dissected off the carotid sheath and the trachea. A complete lobectomy with the removal of the isthmus was done. The right lobe was normal. Pathological report revealed a papillary adeno-carcinoma of the thyroid. The patient is receiving radium therapy and is alive 18 months following operation,

Malignant Adenomatous Goiters,-Graham<sup>2</sup> states malignant adenomata constitute 85% of carcinoma of the thyroid. Chief mode of metastasis is through the blood stream with or without the capsules being in tact. When the diagnosis of malignant adenomatous goiter can be made clinically the condition is hopeless. In the early stages, when the adenomatous mass is removed, it is not possible to state whether it is or is not malignant, Microscopically there is very little difference between the section of a malignant adenomatous goiter and a benign adenomatous goiter. The one point of difference is the invasion of the blood vessels in the malignant type of growth, and not the character or arrangement When the microscopic diagnosis between a malignant and benign growth is so difficult it would seem all the more reasonable to remove an adenomatous goiter in the early stages of the disease.

# KOILONYCHIA REPORT OF A CASE AND A REVIEW OF THE LITERATURE\* By ANTHONY C. CIPOLLARO, M.D., NEW YORK, N. Y.

From the Department of Dermatology and Syphilology, New York Post-Graduate Medical School and Hospital.

TTENTION was first called to koilonychia by Ball who presented a patient afflicted with this condition before the Society of Biology of Paris in 1879. He failed to give the disease a name. Crocker, in 1896, reported the second recorded example of the affection, to which he applied the term spoon nails. Heller, in 1900, suggested the name koilonychia. A search of the literature reveals twenty-six recorded cases of probable koilonychia. Some of the reports contain insufficient information for an unequivocal diagnosis of bona-fide koilonychia. Also, it is probable that some recorded cases were not found because of misleading titles. MacKee21 said that koilonychia was considered a rare disease. He had seen numerous examples of flat and even concave nails associated with diseases such as onychomycosis, psoriasis, eczema, etc., but he had encountered very few cases of true koilonychia during an experience of twenty-five years. He thought it possible that the condition might be fairly common but that patients failed to seek medical advice unless it was important for them to have cosmetically perfect nails.

### Case Report

E.R., female, thirty-one years of age, born in the United States, a nurse in St. Luke's Hospital, New York City, was referred to Dr. MacKee, by Dr. Francis Carter Wood, on February 19, 1926 and was transferred to the writer for investigation and treatment.

Family History. The mother and one sister had always had spoon nails. The father and three other sisters had normal nails. The patient thought that none of her relatives, other than those mentioned, had abnormal nails. The mother died of pneumonia at the age of fifty, and the father of cancer at the age of fifty-six.

Past History. With the exception of the usual diseases of childhood, the patient had always enjoyed perfect héalth. She had had one operation, tonsillectomy, during adolescence. There had been no serious accidents. The patient had never suffered from rheumatism, and there had never been any skin disease.

The nail condition had been present since birth, but while being annoying cosmetically, it never caused pain until a few weeks before she consulted Dr. MacKee. The affected nails had always been flat, concave, curved upward at the terminal extremities and loose at the lateral margins. A few weeks before the consultation, she was assigned to the operating room where it was necessary to frequently immerse the hands in

strong antiseptic solutions. The nails soon became markedly concave and very painful. Improvement occurred soon after she was transferred from the operating room to duty in the private wards; in other words, as soon as she discontinued the frequent use of strong chemical solutions. For a time, the pain was so severe that it was necessary to wear thimbles. The thimble pressed on the elevated edges and hence raised the depressed portion of the nail thereby relieving the pain. It was necessary to wear the thimbles at night in order to obtain sleep.

With the exception of the operating room work, the fingers had never been subjected to traumatism or to strong chemicals. She always gently manicured the nails herself. She had not been in the habit of biting or irritating the nails in any way.

Physical Examination. The patient is a well-developed, well-nourished, healthy adult female, whose height is proportional to her weight. The head is negative. Vision is normal. The pupils react properly to light and accommodation. There is no pathology in the mouth except an unerrupted tooth revealed by roentgenographic examination. The heart, lungs, abdominal and pelvic viscera, the nervous system and all physiological functions are normal. Blood pressure, 110/70. In fact a thorough physical examination reveals nothing of interest.

Clinical Laboratory Examination. specific gravity, 1022; reaction, acid; sugar, negative; albumin, negative; acetone and diacetic acid, negative; microscopic examination, few squamous epithelial cells. The blood Wassermann reaction is negative. Blood count—hemoglobin, 95%; erythrocytes, 4,940,000; leucocytes, 7,200. Differential count — polymorphonuclear leucocytes, 68%; large and small lymphocytes, 28%; transitional leucocytes, 3%; eosinophiles, 1%. Blood chemistry-sugar, 0.094; urea, 9.5; uric acid, 2.1; calcium, 11.8. Scrapings from the nails and from the subungual hyperkeratosis were examined microscopically and cultured for fungi with negative results. From the foregoing it is seen that the clinical laboratory findings are normal.

With the exception of the nails, the ectodermal structures are normal. The skin over the entire body is of fine texture and normally pigmented. Lanugo hair is normal in amount. The sebaceous glands and the sweat glands appear to function properly. The scalp hair is brown, abundant, of fine texture, soft and glistening. There is no eruption on any part of the body. The teeth are normal except, as previously stated, for an unerupted tooth above the superior central incisors.

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 5, 1929.

The Nails. All the finger nails are involved. The toe nails are normal. The affection is most marked on the nails of the thumb and become progressively less conspicuous from the thumb to the little finger of each hand. The condition is symmetrical. When first seen, the thumb, index, middle and ring fingers of each hand were painful at the point where the nail was depressed. There was no visible evidence of inflammation. The nails that were markedly deformed were concave. That is, the nail as a whole was depressed with the lateral and terminal extremities everted or turned upward, producing a spoon or cup appearance. There was a pronounced backward or upward bend at the terminal extremity while the lateral margins were either flat or slightly everted. The nails of the little fingers were flat rather than concave. Those of the ring fingers were slightly concave. The greatest depression was noted on the right thumb nail which had a capacity of 0.25 cc of water. This nail showed a double depression, the anterior one being about thrice the size of the posterior one. The two depressions were separated by a transverse ridge. Dr. MacKee21 said that this interesting detail might be due to intermittent normal and abnormal growth, somewhat as occurred in monilithrix. The left thumb nail held 02 cc of water. Pressure on the nails produced pain.

The normal color of the nails was absent. The color and luster suggested mother-of-pearl or abalone. Here and there were red and gray spots which probably represented variations in thickness and pressure. Except at the ends, where the nail was somewhat thinned, it appeared to be of normal thickness while translucency seemed to be slightly increased. There were no fissures, cracks, ridges (other than the one mentioned) brittleness, striations, pits, or leuconychia. The rate of growth was normal. There was slight but definite subungual hyperkeratosis at the distal

ends of the nails.

Treatment and Subsequent Condition. patient was seen occasionally until October, 1928. The principal treatment was prophylactic. has refrained from frequently immersing her hands in strong chemical solutions such as used by physicians and nurses-mercury, oxalic acid, lime, etc. She washes the hands with castile soap when necessary and disinfects with alcohol or a weak solution of carbolic acid or lysol. Physical therapy was not employed. Each night she rubbed into and under the nails a mixture of equal parts of lanoline and vaseline. Within a few weeks after leaving the surgical room pain and tenderness disappeared, and in a few months the nails had assumed their original condition. At the present writing, almost three years after the first visit, koilonychia is still present but less conspicuous. The depression and eversion are less marked. The color is more that of a normal nail. The subungual keratosis has disappeared. There is no pain or tenderness. The nails are now as they always were before working in the surgical room.

#### Review of the Literature

In 1879, Ball<sup>1</sup> presented the first case of koilonychia before the Society of Biology of Paris. The patient worked in a drug store and washed bottles almost daily with a solution of one of the potassium salts. Ball believed that the nail changes were due to the action of the chemical. No definite name was given to the disease at the time by the author.

The second case on record was described by Crocker2. His patient had lichen planus and a peculiar nail condition to which he gave the name "spoon nails." Whereas the patient presented by Ball was a man whose hands had been exposed to a strong irritant, the case described by Crocker had no such history of exposure to chemicals. The patient was a woman fifty years of age, who had patches of lichen planus which appeared at about the same time as the nail changes. She was a thin, worn looking woman, with no organic disease. Her son had had a severe attack of lichen planus. Crocker did not believe that spoon nails and lichen planus were etiologically related; but he thought that there was some probability that a relationship between spoon nails and rheumatism existed and that some cases were hereditary.

In all, there are twenty-six cases of koilonychia (including the present one) recorded in the literature. Some were associated with organic diseases; some with congenital skin defects, and others with no disease of any kind. Therefore it is important to analyze all these cases to ascertain if etiological deductions may be made.

Crocker\* in his text book cites seven authors whose patients presented afflictions associated with spoon nails. A brief description of these cases, taken from the original reports, follows:

Eddowe's patient was a woman whose brothers and sisters and her father's brothers and sisters had keil only of the ton all such a field were slightly affected. Eddowe and Mackenzie are the only investigators who found the condition present on the toes. The important etiological factor here is heredity.

Mackenzie presented a patient who had koilonychia on only those toes that were affected with rheumatism. Baker's case had no assignable cause. Collan reported a case of spoon nails that had also acanthosis nigricans. Weber and Krieg's' patient had both koilonychia and leuconychia. The patient had valvular heart disease. James stated that there was no discoverable cause for the ungual alterations in his patient. Coleman and Taylor could find no cause

for the nail condition in their patient. There was one brother who had Raynaud's disease.

Now we turn our attention to perhaps the greatest contributor to disease of the nails, namely, Heller. In his first book, in 1900, he suggested that the disease be called koilonychia, certainly a more scientific name than spoon nails. For the sake of uniformity and simplicity koilonychia should be the only term used. To have English speaking dermatologists use the expressive term spoon nails, the Germans aushohlung der nagel and the Italians, French, Spanish and other nationalities still other terms, makes a more complicated literature.

Heller's patient was a woman twenty-five years of age who had had the condition for two and one-half years. The nails lacked the normal translucency. The terminal extremities were notched. Two of the nails were so markedly concave that they could hold eight or ten drops of water. She was completely cured with tar plaster bandages.

Heller cites six additional examples. In order they are:

Rille's patient was thirty-five years old, female, with a negative family history. The condition was present since childhood. Wilson reports that seven members of a family had koilonychia in three generations, definite evidence of a familial tendency for the disease. Riecke also encountered a familial group. His patient was a woman, who had had the disease since childhood. There was no other skin disease. In her family there were four children afflicted with koilonychia. Heller's case in a chimney sweep showed very marked deformity. Some of his nails would hold seventeen drops of water. Heller contends that occupation was not the causative fact—or because all the nails were not involved. Another of Heller's patients had both Basedow's disease and koilonychia. Both conditions disappeared as a result of injections of "Basedow's serum." He does not believe, however, that the spooning of the nails was caused by the overactivity of the thyroid gland.

Forcheimer<sup>6</sup> is the next contributor and we learn that his case was in a girl seventeen years of age, who had had the condition since her sixth year. Besides koilonychia the patient had leuconychia and was anemic. There also was another ectodermal defect, in the shape and color of her teeth. The upper incisors showed a grayish black discoloration and lateral arching. Treatment with mercury plaster produced no improvement in the deformity of the nails.

In 1914, Balban presented before the Vienna Dermatological Society, three cases of koilonychia. All were in males, doing the same kind of work in the same establishment. The first patient was a male adult who had had flattening

and slight concavity of the nails for one year. On the nails were longitudinal striations and the edges of the nails were friable and easily broken. No eczema or hyperkeratosis was present. This is contrary to Heller's opinion. In both his books, that of 1900 and that of 1927, Heller maintains that with koilonychia, there is an associated eczema.

The second patient had had his disease since the beginning of his present occupation which is five years. At first, the disease was most marked on the thumb nails. Here, too was an absence of eczema. Subungual hyperkeratosis was present however, lifting the distal portions of the nails and giving them a plate-shaped appearance. The nail substance itself was unaffected.

The third patient also had had the condition for five years. Absence of eczema was a feature as in the two previous cases. Treatment did not relieve the koilonychia, but with change of occupation, improvement followed.

A summary of the important points in these three cases is instructive: 1. The disease occurred in three men doing the same work in the same printing shop. They were exposed to copper vitriol and sulphuric acid. 2. Therapy with salicylic acid plasters produced no improvement and as soon as the occupation was changed the nails began to improve. 3. There was no eczema in any of the cases. 4. The condition was due, as far as could be ascertained, solely to the chemicals to which the patients were exposed.

Forcheimer's patient presented multiple anomalies and similar examples are in the literature. Ormsby<sup>8</sup> in 1917 presented a case of koilonychia in a boy of fourteen years of age before the Chicago Dermatological Society. The patient was in good health with a negative family history. The teeth were pegged and serrated. There was alopecia and the hair resembled monilethrix. The nails were markedly concave. Some of them had a capacity of ten drops of water. This case was discussed two years later at which time Varney<sup>19</sup> said that it was necessary to exclude syphilis as an etiological factor.

About nine years later, Ormsby<sup>11</sup> presented another case before the same society. The patient was a man of sixty-one years of age who had had the disorder for twelve years. The physical examination was negative. There was thinning and concavity of the nails in addition to the separation of the nails from their beds.

A sailor thirty years of age with a negative Wassermann reaction was presented at the Section on Dermatology and Syphilology of the New York Academy of Medicine by Wise. The finger nails had a well-defined central depression giving them a distinct basin or cup-like appearance, with raising of the distal ends of the nails. In addition the nails were crumbly, pitted, rough

and moderately discolored Scrapings for tinea were negative. The toe nails were not involved. Pollitzer suggested that koilonychia has a smooth surface and that in this case a complication was present, possibly onychomycosis.

Fox's¹o case of koilony chia had syphilis, he indulged freely in alcohol, and he had the habit of biting the nails. There was a definite sub-ungual hyperkeratosis. The lesions were symmetrical involving the thumb, index and middle fingers of each hand. There was no marked change in color but there was a lessening of the luster. Paronychia was absent. Ochs¹o presented a patient with koilonychia before the Manhattan Dermatological Society. The patient later developed psoriasis.

.No assignable cause.

About 35% of the cases have no assignable cause.

About 35% of the cases have heredity and occupation as assignable causes

About 30% have associated diseases with koilonychia,

Heller was of the opinion that koilonychia was caused by the same factors that were operative in eczema. This opinion can now be disregarded as only one in a total of twenty-five patients had eczema. One of Crocker's patients had lichen planus and the patient's son also had lichen planus but Crocker did not believe that the koilonychia was etiologically related to the lichen planus Mackenzie's patient had rheumatism and Crocker thought that rheumatism might be one

Figure 1

Koilonychia Note concavity and eversion of free margins of nails

of the causative factors. He concludes that spoon nails represents a trophic change which occurs with various associated conditions, the common cause of which is unknown. He thought that heredity might be an important factor. Och's patient subsequently developed psoriasis, Coleman and Taylor's patient gave a family history of Raynaud's disease, one of Heller's patients had hyperthyroidism and Collan's patient had acanthosis nigricans. All of the associated conditions thus far mentioned are probably concurrents and have no etiological hearing on koilonychia, otherwise they should be encountered more frequently. One of Heller's patients had Basedow's disease and it is stated that both diseases were cured by the administration of a

for the nail condition in their patient. There was one brother who had Raynaud's disease.

Now we turn our attention to perhaps the greatest contributor to disease of the nails, namely, Heller. In his first book, in 1900, he suggested that the disease be called koilonychia, certainly a more scientific name than spoon nails. For the sake of uniformity and simplicity koilonychia should be the only term used. To have English speaking dermatologists use the expressive term spoon nails, the Germans aushohlung der nagel and the Italians, French, Spanish and other nationalities still other terms, makes a more complicated literature.

Ileller's patient was a woman twenty-five years of age who had had the condition for two and one-half years. The nails lacked the normal translucency. The terminal extremities were notched. Two of the nails were so markedly concave that they could hold eight or ten drops of water. She was completely cured with tar plaster bandages.

Heller cites six additional examples. In order they are:

Rille's patient was thirty-five years old, fe-male, with a negative family history. The condition was present since childhood. Wilson reports that seven members of a family had koilonychia in three generations, definite evidence of a familial tendency for the disease. Riecke also encountered a familial group. His patient was a woman, who had had the disease since childhood. There was no other skin disease. In her family there were four children afflicted with koilonychia. Heller's case in a chimney sweep showed very marked deformity. Some of his nails would hold seventeen drops of water. Heller contends that occupation was not the causative fact—or because all the nails were not involved. Another of Heller's patients had both Basedow's disease and koilonychia. Both conditions disappeared as a result of injections of "Basedow's serum." He does not believe, however, that the spooning of the nails was caused by the overactivity of the thyroid gland.

Forcheimer<sup>6</sup> is the next contributor and we learn that his case was in a girl seventeen years of age, who had had the condition since her sixth year. Besides koilonychia the patient had leuconychia and was anemic. There also was another ectodermal defect, in the shape and color of her teeth. The upper incisors showed a grayish black discoloration and lateral arching. Treatment with mercury plaster produced no improvement in the deformity of the nails.

In 1914, Balban' presented before the Vienna Dermatological Society, three cases of koilonychia. requently moistened with an incompatient with a patient with a substance. This possibility is mentioned patient with a nails of the writer's patient were in a most frequently with strong solutions of

and slight concavity of the nails for one year. On the nails were longitudinal striations and the edges of the nails were friable and easily broken. No eczema or hyperkeratosis was present. This is contrary to Heller's opinion. In both his books, that of 1900 and that of 1927, Heller maintains that with koilonychia, there is an associated eczema.

The second patient had had his disease since the beginning of his present occupation which is five years. At first, the disease was most marked on the thumb nails. Here, too was an absence of eczema. Subungual hyperkeratosis was present however, lifting the distal portions of the nails and giving them a plate-shaped appearance. The nail substance itself was unaffected.

The third patient also had had the condition for five years. Absence of eczema was a feature as in the two previous cases. Treatment did not relieve the koilonychia, but with change of occupation, improvement followed.

A summary of the important points in these three cases is instructive: 1. The disease occurred in three men doing the same work in the same printing shop. They were exposed to copper vitriol and sulphuric acid. 2. Therapy with salicylic acid plasters produced no improvement and as soon as the occupation was changed the nails began to improve. 3. There was no eczema in any of the cases. 4. The condition was due, as far as could be ascertained, solely to the chemicals to which the patients were exposed.

Forcheimer's patient presented multiple anomalies and similar examples are in the literature. Ormsby<sup>8</sup> in 1917 presented a case of koilonychia in a boy of fourteen years of age before the Chicago Dermatological Society. The patient was in good health with a negative family history. The teeth were pegged and serrated. There was alopecia and the hair resembled monilethrix. The nails were markedly concave. Some of them had a capacity of ten drops of water. This case was discussed two years later at which time Varney<sup>19</sup> said that it was necessary to exclude syphilis as an etiological factor.

About nine years later, Ormsby<sup>11</sup> presented another case before the same society. The patient was a man of sixty-one years of age who had had the disorder for twelve years. The physical examination was negative. There was thinning and concavity of the nails in addition to the separation of the nails from their beds.

A sailor thirty years of age with a negative Wassermann reaction was presented at the Section on Dermatology and Syphilology of the New York Academy of Medicine by Wise. The finger nails had a well-defined central depression them a distinct basin or constitution of the presented by

flat or slightly concave nails and not particularly noticed until aggravated by alkalis.

#### PATHOLOGY

No record of histological study has been found. The writer's patient refused to permit the removal of a nail for this purpose, or for experimental therapy. The gross pathology appears to consist of a thinning of the entire nail. There is no softening nor friability. Paronychia is absent. The color changes may be due to a variation in the refractive index. In only one instance was pitting of the nails present. A slight subungual hyperkeratosis was present in several cases. Heller states that the mechanism by which spooning of the nail is produced depends on two factors: 1, the subungual hyperkeratosis at the distal end of the nail raises it; 2, the production of atrophy in the center of the nail completes the Another possible explanation is that the nail is attached to the center and unattached at the distal and lateral extremities, permitting warping and eversion at these points, a defect of nail growth (MacKee).

#### DIAGNOSIS

Typical examples of koilonychia are readily recognized. The affection is usually symmetrical as pointed out by Howe15, and Fox. There are but two recorded instances of koilonychia on the toe nails. The constant features are everted distal ends and flat or everted lateral extremities. Usually there is at least a slight concavity of the central portion of the nail: this is often very There is usually some color change. The nails are likely to be less red. They may be very pale or pink. The luster may be reduced or increased. A mother-of-pearl appearance may be Subungual hyperkeratosis is sometimes present. Usually, the nail is smooth, but at times there may be pits, roughness, fissures; or notches at the distal extremities. As a rule there is no pain nor tenderness.

MacKee21 has emphasized the advisability of differentiating between koilonychia, a congenital defect, and pseudokoilonychia due to other causes such as traumatism, onychomycosis, psoriasis, paronychia, constitutional affections, etc. suggests that there may be two types of koilonychia-congenital and acquired, but until a larger number of carefully studied cases have been reported, he prefers to employ the terms koilonychia and pseudokoilonychia.

#### Prognosis

The prognosis is bad regarding the deformity. Heller is the only one to report a complete cure. The deformity (if marked) can be greatly reduced, and pain or tenderness (if present) made to disappear by avoiding strong alkalis and by the use of circular bandages. As a rule the affection is only of cosmetic importance, but it may seriously interfere with occupation and vocation.

#### TREATMENT

Heller cured a case of koilonychia with tar plaster bandages. Forcheimer failed to obtain improvement with mercury plasters and Balban had the same experience with salicylic acid plaster. In fact most of the authors were unable to materially influence the affection with topical remedies. By using ten parts of stannic oxide and one part of carmine, Forcheimer was able to improve the color of the nails. Ormsby reports improvement following the administration of arsenic. One of Heller's patients had exophthalmic goitre. When the symptoms of hyperthyroidism disappeared (following the use of "Basedow's serum") the koilonychia also disappeared. When koilonychia is accompanied by other local or general diseases such diseases should be attacked in the hope of curing or improving the koilonychia. However, the best treatment appears to be prophylactic. Patients should not allow their nails to come in contact with strong chemicals.

# ALFRED FOURNIER, THE MASTER SYPHILOLOGIST\* By PAUL E. BECHET, M.D., NEW YORK, N. Y.

N this mechanistic age when to many the term syphilis suggests merely a disease in which various chemicals are used intravenously and intramuscularly, it is difficult to realize the deep impression made on sypilology in both its social and clinical aspects by the mind of a master who devoted to the study of that disease fifty-four years of a full and superlatively useful life. When his brain and hand ceased to function forever on the 25th day of December, 1914, the soil of his beloved country was resounding to the tramp of the heavy boots of the invader; it was at its lowest ebb of suffering. He himself must have felt deeply grieved over the physical inability to do his part in this early stage of the war which, even at his death, thwarted the desire of his friends and co-workers to testify to their great love by their presence on his last journey. Most of them were with the Tricolor, many had died beneath its folds, others were doing double duty at the hospitals; hence this great man went to his grave accompanied by only a modest company of mourners.

### THE MAN

Jean Alfred Fournier was born in Paris on May 12, 1832, of humble parentage. He apparently chose medicine of his own accord. for there is no record of any physician as a member of his family. He early showed marked aptitude as a scholar at the Institution Jauffret, soon becoming proficient in Greek and Latin. In 1855, after a rigid examination, he obtained fifth place for an interneship in a Paris hospital, and was assigned to Ricord's service at the Hôpital du Midi, which is now an integral part of the Hôpital Cochin. This assignment must have done much to determine his subsequent career as a syphilologist. He soon became Ricord's favorite pupil, and joined a famous coterie of students, among which were his fellow-internes Mauriac and Panas, both of whom became well known. He alsò served as an interne under Chassaignac, Germain de See, Bergeron, and Boucher de Ville Jouy. In 1860 he received his degree in medicine from the University of Paris. The thesis for his doctor's degree was entitled, "On the Contagiousness of Syphilis."

Fournier was tall, erect, and broad-shouldered. His eyes were blue, his forehead broad, and his bearing military. He wore the usual moustache and goatee, so characteristic of his time. He had a very pleasing, sonorous voice, and spoke clearly and incisively. His didactic lectures were usually given on Fridays at the Hôpital St. Louis. Seated at a long table, surrounded by his chiefs of clinic,

internes, students, and visitors, he delivered his lectures in almost an extemporaneous manner, now and then glancing at a small note book for verification. His notes were written by himself, with many sentences underscored with red and blue lines, thereby serving to emphasize the more important points he had in mind. He liked to use synonyms, gradation, and superposition of analogous terms. His lectures were frequently interspersed with humorous anecdotes. He was very fond of telling stories, his favorite being that of the demimondaine whom he examined in order to protect her clients. "Doctor," said she, "I cannot become accustomed to paying a louis to have you look at me, for in such cases it is always I who am paid." The material for his lectures was in large part derived from his constant custom of taking voluminous notes in both hospital and private practice. He said of himself, "I made myself a collector of syphilitic data, just as a fad or special interest invites others to become collectors of paintings, books, Japanese articles, autographs, etc. Thanks to these notes I was able first, to convince myself, and later to convince my colleagues of the pathogenetic relationship which attaches tabes, general paralysis, leukoplakia, and the specific hereditary dystrophies to syphilis,"

Fournier was an indefatigable worker, his world renown brought him an enormous practice, yet he found time to write more than one hundred and sixty-five articles on syphilis, and fifteen books. Such work is a monument to his industry. His private offices were filled with patients from all parts of the world. All strata of society was represented. He however, kept separate waiting rooms for physicians, men, women, and prostitutes of high and low degree. No matter how stressed with work he was always kind What a fund of sociological and considerate. data must have been furnished him in the secrecy of this consulting room! As his fame spread, he was overwhelmed with honorary degrees, titles, and other honors. His family life was especially happy. A touching devotion existed between him and his wife; she delighted to serve as hostess to his many friends and favorite pupils, to whom their home in Neuilly was always open. His son Edmond was a great satisfaction to him; not only did he help to edit many of his father's works, but contributed on his own account many splendid original articles to the medical literature of his time.

Happiness long reigned over his home, but unfortunately it was not permanent; his last years were full of sorrow and grief over the long and serious illness of his wife. Infirmities inevitably appeared; as the date of his retirement drew near

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

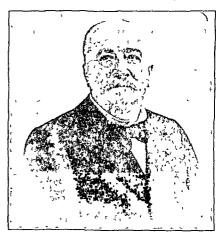

he appeared less often at the hospital. He would often pause in the midst of his rounds complaining of cardiac pain and difficulty in carrying on His last official act was to contribute to the election of Gaucher as his successor at the hospital. He soon thereafter gradually gave up his practice, little by little, and eventually retired to his beautiful home and garden in Neuilly, of which he was passionately fond. His former robust health was a thing of the past, and what was left gradually faded away; his mind and faculties were weakened. Little by little, the vital spark glowed lower and lower, until on December 25th, 1914, it was extinguished forever. Four days later his remains were placed in their last resting place, while the guns of the world, bent on human destruction, belched forth the requiem of a man who had devoted a lifetime to saving life.

#### HIS WORK

Fournier was an exhaustive writer. An examination of his bibliography reveals about one hundred and sixty-five articles, and fifteen books. The wide and varied range of the articles is amazing. His very first work was written two years before receiving his degree in medicine; it was entitled "Leçons sur le Chancre. Par le Docteur Ricord, redigees et publices par A. Fourmer (1 edition, 1858: 2 edition, 1860)." This was followed by "Cephalic Chancre" (1860) and his graduation thesis "On the Contagiousness of Syphilis" It would be too time-consuming to enumerate all the titles of his articles books, the best known are "Syphilis and Marriage," (1880), which was translated into six different languages, and "The Treatment and Prophylaxis of Syphilis" (1893), which went through many editions. His communication to the Academy on the influence of syphilis in infantile mortality in 1885, not only demonstrated to what extent syphilis contributed to infantile mortality, but proposed new methods in preventing it. New and important views were expressed in his "Syphilis Hereditaire tardive" (1886). His "Syphilis Vaccinale" (1889) contributed greatly to the substitution of animal vaccine in place of human vaccine. The first part of his "Treatise on Syphilis" in collaboration with his son Edmond appeared in 1898. To my mind, however, Fournier's most amazing contributions to the literature of syphilis were his "Locomotor Ataxia of Syphilitic Origin" (1876), in which he described thirty cases of tabes in which syphilitic antecedents were proved in twenty-four, and his "Pre-Ataxic Stage of Tabes of Syphilitic Origin" (1885). No doubt exists that these two books were pioneers in establishing the relationship between tabes and syphilis; an astonishing fact when one considers that his conclusions were reached by means of clinical observation alone, long before the cause of syphilis was

known. While the credit for definitely establishing the relationship between tabes and syphilis belongs to Fournier, however, it cannot be gainsaid that as early as 1863 Eisenmann and Topinard both expressed the opinion that syphilis was probably the cause of tabes

Fournier, with an energy almost superhuman, gave of his best to syplulitic prophylaxis. He founded in March, 1901, the "Société Française de Prophylaxie Sanıtaire et Morale," a veritable league against syphilis. His eloquent and urgent appeals drew a membership in this society comprising some of the leading men in France. He wrote many pamphlets on the subject, and one book, "The Prophylaxis of Syphilis" (1903). As a diversion this human dynamo took up the translation of ancient works of syphilis, principally

Alfred Fournier 1832-1914

those of Fracastor, Jean de Vigo, and Jacques de Bethencourt. His hospital work and teaching were equally arduous; the following chronological table best exemplifies it.

1863. Physician of the Central Bureau of Hospitals.

Professeur agrégé de la Faculté de Mèdecine.

1866-67. Instructor in Medical Clinic at Hotel

Diett. 1868-70. Physician and Instructor in Syphilis

at the Lourcine Hospital 1876 Physician to the Hôpital St. Louis.

1880. Professor of Dermatology and Syphilis at the Faculty of Medicine.

Fourmer was made a Commander in the Legion of Honor and became an honorary member of

practically every foreign dermatological Society. He was elected to Honorary Membership in the New York Dermatological Society in 1870, one year after its inception.

Fournier was a great clinician, an acute observer, and a lucid writer. His enduring work based upon the study of a single disease for fifty-four years will forevermore hold the admiration of thinking men.

May we, in closing, reverently salute this medi-

cal pioneer of a past generation—Alfred Fournier, the Master Syphilologist.

In conclusion, I wish to acknowledge my indebtedness to Milian, Jean Darier's splendid biographical sketch in the Annales de Dermatologie et de Syphilographie, Vol. V, p. 515, John E. Lane's admirable translation of Darier's article, and B. Barker Beeson's "Alfred Fournier, his Life and Works." Archives of Dermatology and Syphilis, Vol. X, No. 3, September, 1924, which have aided me in this brief sketch.

# CONGENITAL ABSENCE OF FALLOPIAN TUBE, TUBAL INSUFFLATION By HELEN W. SPENCER, M.D., NEW YORK, N. Y.

From the service of the New York Infirmary

Congenital abnormalities of the Fallopian tube are by no means uncommon. Accessory ostia are frequently seen by gynecologic surgeons. Absence of one or both tubes is less common but has been frequently reported in medical literature. Doubtless many other cases are seen and not reported.

Since the possibility of testing the patency of the Fallopian tube by per-uterine insufflation with various gases was pointed out by Dr. Rubin, the condition of the tubes has been of increased interest. The degree of patency of the tubes is now easily determined in a patient without recourse to operation. When the gas passes through at a higher than normal pressure the question often arises whether both tubes are partially involved or whether one tube is wholly occluded and the other patent.

This case is reported as being of interest because insufflation showed a normal pressure although one tube was congenitally absent:

Age, 26. Married one year. Chief complaint, backache. Two months previously had a spontaneous miscarriage at three months. Pelvic examination showed the uterus retroverted to the third degree, but otherwise negative. Although the uterus was movable, postural exercises failed to bring it into normal position, and so a laparotomy was done. On

opening the abdominal cavity the uterus was found to be normal in size, in third degree retroversion, but easily brought up into position. The left tube and ovary appeared normal; the right tube consisted only of a stump one centimeter long, smoothly rounded on the end, with no evidence of an opening. There was no ovary to be found on that side. The round and broad ligaments were normal.

Both round ligaments were shortened by Simpson's method, the appendix removed, and the abdomen closed by the usual tech-

uque.

Thinking it would be of interest to determine the patency of the one normal Fallopian tube when it was definitely known that the other was entirely without an opening, I did a per-uterine insufflation two months later by Dr. Rubin's method. Using carbon dioxide gas under a pressure of ten pounds in a continuous flow of a rate sufficient to create 100 mm pressure in 20 seconds, the pressure in the tubes rose to a maximum of 100 mm and dropped to a minimum of 80 mm. With this rate of flow this is a normal pressure when both tubes are considered normally patent. Typical shoulder pain was present when the patient sat up.

For a year measures were taken to avoid pregnancy. When contraceptive measures were discontinued, the patient promptly became pregnant, and after due term was

normally delivered of a normal child.

#### THE MANAGEMENT OF BREECH PRESENTATIONS\*

By KARL M. WILSON, M.D., ROCHESTER, N. Y.

(From the Department of Obstetrics and Gynecology, University of Rochester School of Medicine and Dentistry.)

tations are associated with a high foetal mortality, and this foetal mortality is generally recorded as averaging 10 per cent. This would seem to be a high figure for what, after all, is a fairly frequent type of presentation, and is higher than the general foetal and neo-natal mortality.

A number of questions naturally arise in this connection:-What are the reasons for the high foetal mortality? What can be done to decrease it? Are we sufficiently impressed with the dangers to the foetus associated with breech presentation, and are our methods of handling these presentations adequate, or are they in need of revision? I shall attempt to formulate at least partial answers to these questions.

Among the common causes of foetal death are injuries to the tentorium, as pointed out by Eardley Holland. These may result from too active efforts at extraction, but are also sometimes observed in babies born spontaneously. Again, the child may perish from intra-uterine asphyxia as a result of delay in the delivery of the after-coming head. Sometimes the cervical vertebrae are dislocated or again, abdominal viscera may be ruptured as a result of forcible efforts at extraction. Occasionally foetal death is caused by premature separation of the placenta. These possible causes of death do not tell the whole story, so far as the child is concerned, and numerous children are born alive who, on examination, reveal fractures, dislocations, Erb's palsies or cerebral injuries.

The first difficulty in connection with a breech presentation may come with the diag-Usually this is easy and the first manoeuver of palpation will reveal the hard, round, ballottable head occupying the fundus of the uterus. On the other hand, the head may be overlooked or palpation may be quite unsatisfactory, and I can recall my own vivid embarrassment on more than one occasion when the supposed vertex presentation proved, at the end of the second stage of labor, to be a frank breech. In doubtful cases an x-ray picture, when this is available, at the end of the pregnancy will clear up the diagnosis and give the attending physician the necessary forewarning, in order that proper steps may be taken.

In connection with the question of errors

LL authorities agree that breech presen- in diagnosis, I would like to present two examples of another type of error which came under my observation. Several years ago I was called to see a patient in consultation, the doctor informing me that he was attempting to dilate the cervix manually and that, after half an hour's effort, he was able to introduce only one finger in the external os. Urging him to desist in his efforts, I hastened to the spot and was amazed to find on my arrival, a half hour later, that the patient was obviously in the latter part of the second stage of labor, with the perineum bulging, and before any preparations could be made she was delivered spontaneously of a normal sized baby presenting by the frank breech. The child was alive but inspection of its anus and perineum revealed a deplorable state of affairs, the sphincter and perineal body being completely torn through. The child was a male, so obviously one mistake made was that of supposing the anus of the child to be the external os, while the second mistake, assuming the external os to be correctly recognized and found closed, was in attempting a forcible dilatation of it.

Last year I operated on a thirteen year old school-girl who came to my clinic complaining of rectal bleeding. Examination revealed an old complete perineal tear. Further history obtained from her mother revealed the fact that this had been present from birth. It was also learned that at birth this child had presented by the breech and that interference had been resorted to before dilatation of the cervix had been attained. Presumably the same mistake was made in this instance as occurred in the first patient mentioned. A colleague recently informed me that he has a similar patient under observation.

I do not present these patients in a tone of facetious criticism of those who made these mistakes, but rather to emphasize the fact that there are sometimes very real difficulties in the way of making an accurate diagnosis, particularly for the inexperienced person. After all, those of us who are responsible for the teaching of obstetrics must share a fair proportion of the blame when such mistakes are made.

Having made a diagnosis of breech presentation, what should be our procedure? In this connection I would like to say a word in regard to external, or cephalic version which I fear is on the verge of becoming a lost art. I

<sup>&</sup>quot;Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

recognize the fact that this procedure has very distinct limitations and will very often be unsuccessful. Furthermore, that it is not unassociated with danger when improperly employed. On the other hand, the results are so very satisfactory when it is successful that it seems to me to be always worthy of the attempt. The procedure is limited to those patients seen at the end of pregnancy or at the very beginning of labor. After labor is well established the procedure will be futile and likely to do more harm than good. All manipulations must be most carefully carried out and no undue force used. The Trendelenberg position is sometimes of great help in facilitating the manoeuver. If under these conditions, the position of the child cannot be changed by gentle manipulation, the attempt must be abandoned, as the exercise of undue force might well bring about a premature separation of the placenta or a still more undesirable presentation than the original one.

The occurrence of a breech presentation in a primiparous woman deserves attention from the standpoint of possible pelvic contraction. True, the pelvis may be normal and if that be true, so much the better, but on the other hand, a contraction of the pelvic inlet may be a factor in the causation of the breech presentation, the inlet being too small to permit proper engagement of the head. When a breech presentation is discovered in a primiparous woman at the end of pregnancy, very particular attention should be paid to the pelvic measurements. If an inlet contraction is found to be present, it becomes a matter of extreme nicety of judgment to decide, in cases of moderate contraction, whether the degree of contraction present is sufficient to prevent the passage of the head-a much more difficult matter to decide than in vertex presentation when the disproportion, if any, may be estimated by the method of impression. As a rule, in these circumstances, I feel safe in asserting that delivery should usually be by Cæsarean section when the child is at term and the diagonal conjugate measures 11 cm. or less.

The most serious danger to the child arises, of course, during the second stage of labor and particularly during the latter part of the second stage, if there be delay in the delivery of the after-coming head. It is at this time that the obstetrician must be constantly on the alert.

It is not my practice to subject all breech presentations to a manual extraction, but at the same time, one should always have the necessary preparations made so that interference may be resorted to at a moment's notice should the indication arise. Time will not permit of a detailed discussion of all the

possible complications which may arise or the conditions that may go wrong during a breech delivery. I shall content myself with presenting what I believe to be the most satisfactory methods of procedure in a typical case of frank breech presentation in a primiparous woman in the second stage of labor.

Care should be taken to avoid any manipulation which might result in rupture of the membrane before complete dilatation of the cervix has been attained or even longer, in order that the upper portion of the birth canal may become properly dilated. During the second stage, nitrous oxide and oxygen is administered with each uterine contraction to the point of analgesia. When the breech reaches the pelvic floor, the patient is brought to the edge of the delivery bed or operating table, placed in the lithotomy position and every preparation made ready for interference should it become necessary.

As the breech distends the outlet, a midline episiotomy is done; this being carried out while the patient is still in an analgesic state. If progress continues, the anesthesia is gradually deepened until the body of the child is almost completely born, no attempt being made to free the arms until the scapulae are well in view. When freeing the arms becomes necessary, free first the easier one, usually the anterior arm. Moderately firm pressure is now made over the fundus and, with the head in the pelvis, complete anesthesia is inthe head either being allowed deliver spontaneously or extracted by the Mauriceau manoeuver. I would emphasize the value of episiotomy, lateral or median, according to the operator's preference, in this type of delivery. The resistance of the pelvic floor is overcome, this resistance, even after expulsion of the body of the child, so often causing undue delay to the after-coming head, and furthermore, if interference does become indicated, the manipulations incident to it are facilitated to a great degree.

Other procedures have been suggested to overcome the resistance of the perineum. Couvelaire, Caldwell and others for example, recommend the use of the hydrostatic bag, while others recommend the "ironing out" of the perineal muscles manually. Both, no doubt, are procedures of value, but my personal preference is for episiotomy as being quicker and offering less likelihood of introducing infection. It must be remembered that the episiotomy should be deep enough to permit passage, not only of the breech, but also of the head, which will require more room than the breech.

For the delivery of the after-coming head, Piper recommends the application of forceps as a routine procedure, and has devised a special instrument for this purpose. Piper himself reports excellent results from this procedure. While in his capable hands this is no doubt true, I hesitate to recommend it as a routine procedure, as usually being unnecessary, and for the occasional operator, often quite difficult of execution. At the same time, it has an undoubted place in effecting delivery of the head in the difficult cases and particularly when the head has been arrested at a high level.

From my own experience, as well as from observation of numerous young men undergoing their hospital training, I cannot escape the conviction that very often the obstetrician creates his own difficulties in treating breech presentations, and that very often he unconsciously converts what would have been a comparatively simple procedure into an extremely difficult one. As I see the situation, these difficulties often arise from the following causes:

- Beginning the extraction too soon and allowing the head to become extended.
  - 2. Trying to free the arms too soon.
- 3. Failure to follow the normal mechanism of labor when an extraction is performed—rotating the body too soon and bringing the head into such a position that it can only enter the superior strait with difficulty, or not at all.
- 4. Beginning an extraction through a cervix which is dilated sufficiently to permit the passage of the breech but which will not permit the passage of the head—a not infrequent stumbling block.
- 5. The exercise of too great force, or the application of that force in a jerky manner with resultant injury to the head or neck.

May I present a few results which have followed this conservative line of treatment. In the past year and a half, there have been thirtytwo full term breech presentations delivered in my service. In this small series, there were no foetal deaths. I hesitate to present such a small group of cases, and while uniformly excellent results were obtained, I fully realize that such a small series does not justify any sweeping conclusions. On the other hand, perhaps some significance may be attached thereto, if I remind you that with two exceptions, these women were all delivered by the resident staff-young men undergoing their hospital training, in whom I have tried to instill the principles of conservatism. In addition to these full term deliveries, there were four premature babies delivered, one macerated, two non-viable, weighing 1200 grams or less, and two premature living children. In these three foetal deaths the breech delivery obviously played no part in the causation of the death.

The outline of treatment offered will not, of course, be applicable to all cases, and we all know that urgent maternal or foetal indications may arise which call for interference. and this possibly at a time in labor when conditions are far from suitable for immediate delivery. We may then be face to face with an extremely difficult problem. These less frequent, and the unusual complications, however, I shall not touch upon at this time, as I believe if greater deliberation and care be exercised by the physician, that it is the other group of patients that offers the best opportunity for improvement in our results. As I said before, I cannot escape the conviction that the attending obstetrician often creates his own difficulties.

To sum up, I feel that the following are the points to emphasize in the care of the ordinary type of breech presentation:-Careful diagnosis of the presentation and accurate pelvimetry. Gentle attempts at external version, which may fail. Avoid unnecessary examinations for fear of rupturing the membranes prematurely. During labor, an attitude of watchful waiting, with an anesthetic, preferably nitrous oxide, administered to the point of analgesia only, preparations being made in the meantime for immediate interference if necessary, and careful watch kept on the patient's general condition and the rate and rhythm of the foetal heart. Episiotomy as the breech distends the vulva—complete anesthesia for the delivery of the head, either spontaneously or manually-assisted by steady but moderate pressure from above. These presentations should not be subjected to manual extraction as a routine. If extraction becomes necessary, simulate the normal mechanism of labor as closely as possible. Do not attempt to free the arms too soon and be sure the cervix is fully dilated.

I have presented no new procedures to overcome the difficulties incident to this type of presentation, but on the other hand, I believe it possible to materially improve our results by careful and deliberate attention to the wellknown methods already available—another obstetrical situation in which conservatism is distinctly preferable to more radical measures.

### THE ANNUAL MEETING

Preparations are well under way for the Annual Meeting of the Medical Society of the State of New York on June 2-4, 1930, in Rochester. The next issue of this Journal, that of April 15th, will contain the scientific programs, and descriptions of the commercial exhibits. The issue of May 1st will contain the annual reports of the programs and the reports.

officers and committees. Both issues will therefore be of great importance to all the members of the State Society,—and that includes every member of every county society whether or not he expects to attend the annual meeting. Watch for next two issues of your Journal and read the

### THE CHANGING ORDER OF MEDICAL PRACTICE

A change in the practice of medicine has occurred not only among physicians who bring knowledge and skill to their patients, but also among the people in their acceptance and appreciation of medical services. Changes and extensions of medical knowledge have always found the physicians adaptable; and a group of modern doctors would feel entirely at home among the medical men of half a century ago. Physicians have been complacent as they have seen the diseases on which they were principally dependent for a living disappear under the increased skill of their ministrations; while at the same time the extension of medical discoveries has developed new forms of practice. The loss of malaria cases, for example, has been balanced by the increased practice in the field of metabolism, especially diabetic and cheumatic affections.

Doctors have not been greatly disturbed by the change in the forms of sickness which they treat, unless one excepts the older men who think in terms of quinine instead of insulin; but physicians have been deeply affected by the changed attitude of the people toward the acceptance of medical services, and they are now in the process of adjustment to the new

temper of the community.

The modern developments of society along economic and social lines have resulted in a multitude of organizations being formed to uplift men and women morally, mentally, and Since bodily ailments are more physically. tangible and are more readily corrected than those of mind and soul, non-medical workers have invaded the peculiar field of the practicing physicians and have developed new methods of contact between the patients and the The argument of the non-medical doctors. workers was that medical problems of the community should be settled by community action, including giving medical service impersonally as one would deal out money to the The crude proposition of State medicine which they first proposed has been discarded: but in its place have come "demonstrations" in order to induce governments, local, state and national, to take over and carry on the work which the organizations originate and promote. Reform organizations have also entered the fields of morals and culture, but the minister of the Gospel and the school teacher have always made their contacts through groups of persons rather than individuals. On the other hand the physician has given his ministrations as an individual doctor to an individual person; and he has not adjusted hmself to the newer idea of his responsibility as a member of a group called the medical profession to persons as a group called the community. Neither

have the health organizations, either voluntary or official, provided for the remuneration of the individual physicians who give their services to the community. It is still customary for communities and organizations to expect individual physicians to give their services to them and their wards without expectation of pay. They seem to think that their advertising of the physicians who serve under them will bring the doctors enough new practice to reward them for their free services.

However, physicians recognize the justness of the intentions of the health organizations to make medical service available to all classes of people. Approximately one-third of all persons needing medical attention are unable to pay for the service which they need; and yet many families of such persons are on the visiting lists of their physicians in private practice. Doctors practice philanthropy beyond the members of any other profession, but they are dissatisfied when reform workers create a further demand for an increased amount of service without also providing the means for paying the doctor for that work. The organizations pay administrators, clerks, social workers, and visiting nurses, and yet expect doctors to work for nothing. Current medical literature is full of complaints of physicians that they are unfairly treated by health organizations and governmental bodies.

The situation today is that there is an incompleteness in the adjustment of family doctors to other groups engaged in health work, yet great progress has already been made in the readjustment. Health organizations have created the demand for remunerative medical service beyond all expectations of a quarter of a century ago; and the doctors have responded to a greater degree than is accredited to them. The readjustment has received the serious consideration of every State medical society and of a constantly increasing number of the county medical societies. Out of the most active standing committees of the Medical Society of the State of New York is that on Public Relations, whose principal object is to bring about active cooperation of physicians with other health groups. Also, nearly every county medical society in New York State has a committee on Public Relations which is assuming the leadership in the practice of civic medicine in its own county. If it is true that "A work well begun is always half done," then the medical profession of New York State is well advanced in its readjustment to the modern conditions of the practice of medicine. But diagnosis is always far in advance of treatment, and the recognition of defects is far easier than their

with syphilitic bubo. The fact that several quite dissimilar conditions can simulate one another is held by the author to be the result of peculiar allergic conditions, the reaction of the lymphnodes to certain irritants giving rise to a common picture. Thus a differentiation based purely on pathological histology seems impossible, for the pictures are sometimes identical.—Klinische Wochenschrift, February 22, 1930.

Treatment of Pernicious Anemia with Desiccated Hog's Stomach.-Arnold Renshaw reports a case of pernicious anemia in a man aged 52 years, in whom blood transfusions, liver diet. and liver extracts did not appear to bring about the improvement so frequently seen in other cases. The patient's condition became desperate; he was extremely anemic, the lips were blanched, the conjunctive pale. The spleen was enlarged two fingerbreadths below the costal margin, and the liver was firm and enlarged. The pulse rate was 120, with the patient at rest in bed, and there was a fair amount of edema in the feet. It was then decided to try desiccated hog's stomach. At first 7.5 grams were given daily. After a few days the dose was increased to 15 grams, and at the end of two months it was further increased to 20 grams. Under this treatment there was marked improvement in the patient's general condition; the pulse rate returned to normal and the symptoms above enumerated practically disappeared, though albuminuria was still present. The blood count at the time desiccated hog's stomach was first administered showed red blood cells 830,000, white blood cells 2,000, hemoglobin 20 per cent.; at the end of a little over two months' treatment the red blood cells had increased to 3,600,000, the white blood cells to 6,200, and the hemoglobin to 64 per cent. (Haldane). There was a corresponding improvement in the other blood elements.—British Medical Journal, February 22, 1930, i, 3607.

Pre-existence of Antitoxin in the Blood.-The prevalent idea of antitoxins is that they are reactionary bodies produced in response to the entrance into the blood of an antigen. The fact that some children are naturally immune to diphtheria has never militated against this view. Drs. F. K. Kleine and H. Kroo of the Robert Koch Institute, however, while on a journey in East Africa tested 101 natives, nearly all children from 6 to 15 years old, for the Schick reaction with practically negative results although the test on the African skin is difficult to execute. The blood of 11 of the subjects was then tested for the actual presence of diphtheria antitoxin, using the Römer method. Not only was antitoxin found but the amount was large. The same subjects tested with the Schultz-Carlton method for scarlatina antitoxin also gave positive results. These finds are astounding for there is no evidence that these aborigines had ever undergone any sort of visitation of either disease and the entire subject of natural and acquired immunity may have to be revised to meet these facts. It can only be conjectural whether these natives are immune to actual epidemics of these diseases. Scarlet fever is rare all through the tropics and diphtheria is not regarded as a serious menace.

—Deutsche medizinische Wochenschrift, January 10, 1930.

Joint Affections of Endocrine Origin-H. J. Lauber and Ch. Ramm contribute a study of arthropathy from defect of ovarian secretion, and G. Riebold publishes in the same issue of the Münchener medizinische Wochenschrift, (Jan. 17, 1930) an article of broader scope on the endocrine arthropathies in general. Climacteric joint troubles have long been recognized and find their counterpart in analogous affections due to suppression of other endocrine functions. The joints involved in the ovarian type are those of the fingers, wrist, and knee and exposure to cold, especially cold water, seems to be a contributory The mechanism is obscure and the authors accuse a vascular spasm. Objectively the small joints of the fingers and wrists are seen to be thickened, while active and passive motion is restricted and painful. The radiographic finds are not characteristic. The nature of the disare not characteristic. order is shown in the beneficial action of ovarian extracts, combined or not with potassium iodide and hydrotherapy. Riebold also gives space to the ovarian type, which may be due to underfunction or dysfunction. In the artificial röntgen climacteric the knee is often involved and less frequently the shoulder and fingers. The women are often unduly corpulent and thyroid feeding seems indicated, although some have seen only negative results from both ovarian and thyroid feeding. Patients who show marked hypofunction of the thyroid may benefit from the latter, and evidently the success or failure of the gland treatment depends on the accuracy of the diag-Mere corpulence at the menopause is not evidence of thyroid underfunction, but if the thyroid has been removed for goiter or if the picture of mild myxedema is recognizable, extracts from this gland may give remarkable results. Riebold sums up by isolating two types of joint disease. One of these tends to attack large joints and to appear at the menopause, but the other occurs when the ovary is in full activity and may be associated with anomalies of ovulation and menstruation, the small joints being prone to suffer.

Present Status of the Chemistry of Vitamins and Hormones.—F. Laquer says there are six separate vitamins of which three are fat soluble and three water soluble. The former comprise A, a growth factor; D, antirachitic, and E, antagonistic to sterility in rats and mice. The water soluble are B<sub>1</sub>, which is antineuritic, B<sub>2</sub>, a growth factor which prevents pellagra, and C, antiscor-

butic. Vitamin A is chemically closely allied to the coloring matter carotin while D is a transformation product of ergosterin. Vitamin B, has been isolated in crystalline form. Less is known of vitamins E, B2, and C so far as their chemical status is concerned. In like manner the hormones are tabulated. The following have a chemical status: The hormone of the medulla of the suprarenal gland, which has been isolated in crystalline form and made synthetically. The same is true of the hormone of the thyroidnatural and synthetic thyroxin. Insulin has been isolated from the pancreas as a crystalline body but is complex and its status chemically is still in abevance. The same may be said of the crystalline body isolated from the ovary. In regard to the two hormones from the anterior and posterior lobes of the hypophysis the author, despite the pioneer work of the Americans, Abel and Kamm, does not regard the chemical status as settled. Each of these hormones is composite, made up of two or more bodies with separate physiological action. As for the hormone of the parathyroid, the author holds, we know of it only through the behavior of extracts of the gland, while hormones of the male gonad, thymus, and pineal body simply do not exist. The author's paper was evidently written before the publication of the reports of the new vascular hormone extracted from the pancreas and distinct throughout from insulin .- Klinische Wochenschrift, Jan. 18, 1930.

Psittacosis.-G. Grunwald and Fr. Meyer trace the history of our knowledge of this subject as far back as 1876 (Jürgensen) and since that time cases have continued to accumulate. Now and then small epidemics develop, as in 1892 in Paris when 49 cases were recorded by Nocard, who also isolated a microorganism, although this is not commonly regarded today as the true cause of the disease. In 1898 there was a newspaper scare in Berlin over parrot disease and the medical men gave the opinion that the latter was closely allied to typhoid fever, while 10 years later paratyphoid bacilli were found in at least one bird. In 1900, however, the cause of the pneumonic complication so constantly present was given as a streptococcus. Since that period many reports of cases and epidemics have been without bacteriological finds of any kind. The authors were possibly the first to take röntgen pictures of the chests but the alterations were extremely slight considering the severe grippe-like early symptoms and subsequent pneumonia. The bacteriologists are very pessimistic at present and give no aid or encouragement but the authors tried some sera, including a polyvalent influenza serum, and later, when streptococci were found in the blood, streptoserum. Aside from this they also treated some of the patients for grippe-pneumonia, giving quinine derivatives. One patient had virulent hemolytic streptococci cultured from

his blood. Both ordinary streptococcus serum and scarlatina serum were given to this patient who seemed to respond to it. Nine histories in all are given with two deaths. Not all of the patients had pulmonary lesions and in some cases the involvement of the lungs was not marked. The authors sought especially to ward off pneumonic complication in the early stages where the picture is that of simple influenza. Study of the authors' cases shows nothing suggestive of clinical typhoid or paratyphoid.—Deutsche medizinische Wochenschrift, January 31, 1930.

The Bacteriology of Parrot Disease.—G. Elkeles gives a much needed summary of this subject. All of the secretions of several sick human beings and birds were carefully examined. There are some adherents of the original Nocard bacillus (Salmonella psittacosis), while others incline to the streptococcus first isolated by Selter. The Nocard microorganism is regarded as closely related to the Breslau type of the paratyphoid bacillus, but not identical with it. This group has members which are highly pathogenic to birds and small animals and different varieties or species have been made responsible for a variety of diseases. Now and then a modern observer finds an organism of the Nocard type which agrees quite with the earlier finds. Among these is the author himself who cultivated one from the intestine of a Brazilian parrot. The bird was apparently healthy at the time but became ill later. Others found the organism in the heart's blood. But such positive funds are highly exceptional, nor is there any evidence that cultures of this organism can be made to cause a general infection. The streptococcus of Selter may be brought into relationship with the pneumonia of parrot disease and this bacteriologist once succeeded in aspirating it in pure culture from the lung of a living patient. He assumed for the time being that the organism was the specific cause of parrot disease but gave way in this view as no one has succeeded in reproducing the disease with cul-An experimental psittacosis is in fact quite unknown. The author is skeptical as to our knowledge of the causes of the affection and states that we must begin our research anew. In the meantime we can advance no rational treatment and no prevention save ordinary quarantine.—Münchener medizinische Wochenschrift. January 24, 1930.

Endarteritis Obliterans of the Extremities.—A. P. Cawadias discusses the etiology and physiopathology of endarteritis of the extremities and shows that it is not a special disease differing from thrombo-angiitis obliterans, or Buerger's disease. He emphasizes the importance of early diagnosis through the application of the oscillometric method of exploring the circulation. Treatment should be directed to the basic meta-

bolic disturbances. The most important measure consists in the use of pancreatic preparations directed against the pancreatic element. A number of authorities have shown remarkable results from insulin treatment. After insulin has been tried, various shock preparation should be used. During the past four years the author has employed yatren-casein, which acts probably through the same mechanism of shock, though there is a special action of the iodine on the metabolic disturbances of the arteries. Spa treatment and adrenalectomy are also helpful. The second objective in the clinical management of endarteritis obliterans consists in the diminution of the vascular spasm and the fostering of dilatation of the vessels. The various methods advocated should be used alternately, and followed with the oscillometer. The nitrites, aspirin, and acetylcholin will yield good results. Nitrites may be given by mouth or in the form of injections of sodium nitrite, twenty 1 c.c. injections of a solution containing 0.01 gm. of sodium nitrite per cubic centimeter. Acetylcholin is given in a series of daily injections of 0.05 to 0.10 gm. Of the physiotherapeutical methods diathermy is best. Balneotherapy is very important. Massage is strictly contraindicated, as is also any undue strain (exercise). Leriche's operation enhances vasodilatation, but must be applied only as a last resort. -British Medical Journal, Feb. 8, 1930, i, 3605.

Danger from Intravenous Injections of Glucose in the Ketonuria and Coma of Diabetes.— I. St. Lorant and E. Froehlich refer first to the common custom of injecting glucose in diabetic coma, the reasons alleged varying with the medical man. It is true that these injections tend to antagonize the danger of hypoglycemia, but the antiketonic action is open to some question. one continue to inject glucose there is also the obligation to inject more and more insulin. it be admitted that glucose possesses an antiketonic action there is no reason to conclude that it can ward off coma. The authors have tested a number of patients with ordinary diabetes and diabetic coma with reference to the full action of glucose. A comatose patient after venesection received 8 grams of glucose dissolved in 20 cc. of water and the blood was then tested for ketone bodies with Van Slyke's method. One hour after the injection the blood ketone bodies had notably increased, and the same result was obtained in precomatose patients. Moreover injection of insulin did not antagonize or ward off this result. The finds are given in a number of cases and it was seen that the blood concentration did not return to the pre-injection level until 2 or 3 hours had elapsed. Others have ascertained that adrenalin injections given subcutaneously can increase the concentration of blood ketone bodies. authors do not mention that the patients were damaged critically by the glucose injections-in fact there is complete silence as to the fate of the parients. But they are opposed, perhaps on theo-

retical grounds, to injecting glucose in coma or precoma. They are non-committal as to the injection of glucose in simple diabetes. One of the possible sources of danger is that collateral injection of large doses of insulin in these cases will expose the patient to an alarming degree of hypoglycemia.—Klinische Wochenschrift, February 1, 1930.

Indications for the Use of Insulin.—Walter R. Campbell arranges diabetics who need insulin temporarily or permanently into five groups: (1) acidosis cases; (2) coma cases; (3) infection cases; (4) pre-operative cases; (5) low carbohydrate cases. With adequate treatment no patient with acidosis need go into coma. patient should be put to bed, kept warm, urged to take all kinds of warm drinks liberally, and, most important, he should receive 20 to 40 units of insulin, accompanied by orange juice, grape juice, or diluted corn syrup, this treatment being repeated every three or four hours until the symptoms disappear. Forty units of insulin a day will keep most patients out of danger until the diet and insulin can be more suitably adjusted. In coma the loss of an hour is an inexcusable delay; 100 units of insulin, with 1,000 c.c. of 10 per cent. glucose, should be given intravenously as soon as possible. Ketone production should be inhibited by adequate provision of the required calories in food other than fat. Coma can usually be overcome by 200 units, though larger amounts may be given, if properly balanced by carbohydrates. In the diabetic with infection, the caloric intake should be increased above that ordinarily required at rest, it being often desirable to resort to milk, cream, and egg mixtures with orange juice, and much more insulin is required. It is useful to cut down the size and increase the number of doses, according to the indications in the individual case. The diabetic requiring operation needs additional insulin as a safeguard against post-operative acidosis; if possible a week should be spent in preparation. In an emergency operation, 25 units of insulin and a glass of orange juice, or 25 gm. of glucose, should be given before the operation, and postoperatively, the patient should be treated as a case of acidosis. The most important indication for insulin is in diabetics with low carbohydrate tolerance, following in its use the principles laid down by the author. No patient should receive insulin on anything but a weighed diet suitably constituted. The uses of insulin in nondiabetic cases are extremely limited. In intractable anorexia from various causes hunger may be induced with insulin when other measures completely fail. Beginning with 10 units, increasing amounts of insulin are given until hypoglycemia is induced and hunger experienced. With a little care a daily intake of 4,000 to 5,000 calories is readily attained.—Canadian Medical Association Journal, February, 1930,

### LEGAL

### MR. STRYKER RESIGNS AS GENERAL COUNSEL-MR. BROSNAN APPOINTED

By LLOYD PAUL STRYKER, ESQ. Counsel, Medical Society of the State of New York

At a meeting of the Executive Committee held on the 13th day of March, 1930, the writer resigned as general counsel of the Medical Society of the State of New York to take effect on March 31st of this year. His resignation was accepted with regret and Mr. Lorenz J. Brosnan, the present attorney of the Society, was appointed general counsel as of March 31st.

The writer took occasion at the time of his resignation to assure the Executive Committee, and now takes this opportunity to inform the entire profession, how deeply he has appreciated the cordial cooperation, good-will and kindness displayed to him by the State Society, its officers, committeemen and members. It has been a pleasure and an honor to represent your most worthy organization and to defend those of your members who have been unjustly accused of malpractice. This work has brought the writer into every section of the State, to all of the cities, and most of the county seats, and has brought him in close personal contact with innumerable members of the profession. The work has been onerous, but has given that pleasure which comes from a consciousness of an endeavor to perform well a worthy undertaking. It is, therefore, with genuine and sincere regret that the writer now severs his connection with the State Society as its general counsel.

What actuated this resignation was stated by the writer in his letter to the Executive Committee as follows:

"The reasons which prompt my resignation are-based upon my desire to enlarge my professional life and to avail myself of the increasing opportunities which have come to me to act as trial counsel in other kinds of litigation. My duties as your general counsel have so preempted my time as to make it impossible for me to devote myself as fully as I should like to do to other fields."

It is a genuine pleasure to congratulate the Society upon its choice of the new general counsel. Mr. Lorenz J. Brosnan is a lawyer of outstanding ability and character, and brings to the performance of his new duties a proven record of achievement in which he may well take a just pride. For the past four and one-half years and more, he has been actively engaged in trying malpractice cases, and has been opposed by some of the ablest lawyers in this field and has succeeded in defeating all of them. In addition to his actual work in

court, he has long participated in all our counsel and legislative work, and is fully familiar with all your problems, your policies and your aims. As the writer's successor, he will have his cordial good-will and his most loyal good wishes.

In his letter to the Secretary on the occasion

of his resignation, the writer stated:

"Although I have devoted the best of my ability and endeavor to the performance of my duties in court and in conference, in reviewing the past years I feel that perhaps the largest contribution which I have made to the Society is in the development of an able and a worthy successor. I am, of course, referring to Mr. Lorenz J. Brosnan, the present attorney for the Society and who has been associated with me since the fall of 1920. \*\*

"There are now pending in this office upwards of five hundred cases, all of which are prepared or are in the course of preparation, and with all of which Mr. Brosnan is personally familiar. He is, therefore, able to step at once into the place which I am about to leave and is equipped in every way to fill it admirably. Not only do I express the unqualified opinion that your interests will be secure in his hands, but I will go even further and state that were I asked to name any lawyer as competent and as trustworthy for this position whom it would be possible for you to secure, I should say without reservation that there is no one whom I would prefer to this gentleman. He will be able to continue at the above address (as I am moving to 40 Wall Street) and will retain practically the entire staff, whose long familiarity with the details of this work is in itself quite indispensable to the successful handling of your legal affairs.

"May I say also that from my long personal, close and friendly contact with Mr. Brosnan, I have come most warmly to appreciate his fine personal traits, his sensitive honor and his possession of those qualities which make for confidence and friendship."

It is also a pleasure for the writer to assure the entire profession, as he has already assured the Executive Committee, that his high estimate of Mr. Brosnan's character and ability is fully shared and endorsed by Mr. George W. White-side, the writer's predecessor and for many years his partner.

Upon Mr. Oliver's retirement as the attorney

for the Society in 1928, Mr. Brosnan was appointed attorney in his stead. The work which largely fell to Mr. Oliver's hands has been handled most satisfactorily, by Mr. Maxwell C. Klatt, a lawyer of ability, who has been with this office for nearly ten years. The Executive Committee therefore most wisely, upon its elevation of Mr. Brosnan to the position of general counsel, appointed Mr. Klatt as the attorney for the Society.

As an evidence of reciprocal good-will, the

Executive Committee requested the writer to accept the honorary post, without compensation, of consulting counsel to the Society, and this position was accepted.

In closing this, the last of the editorials which will come from this pen, it gives genuine pleasure to send this message of good-will to every member of your Society, and sincere appreciation for all of the manifold kindness and cooperation which you have accorded without stint.

## CLAIMED NEGLECT IN TREATING CONDITION OF PAN-SINUSITIS AND OTITIS MEDIA

In this case the plaintiff consulted the defendant physician bringing with her certain x-ray pictures showing a condition of pansinusitis of the nose sinuses. The physician under a local anesthesia inserted a trocar into the antrum, and removed the inner wall and also the ethmoid cells. He then used suction for the purpose of cleaning out the sinuses. On this occasion the patient remained in the doctor's office for approximately seven hours, when she was permitted to return to her home.

She continued to call at the doctor's office every day for a period of two weeks, on which occasions suction was applied and the sinuses cleaned out. Approximately two weeks after the original visit, the plaintiff developed an otitis media which was cleaned out by suction and peroxide applied. The patient returned to the doctor's office every day for a week for

treatment of this condition, on each of which occasions the same treatment was rendered.

At the end of one week, it was found that the patient was developing a mastoid condition, and she was advised to get an x-ray. The following day the attending physician received an x-ray report indicating a mastoid involvement.

The patient had only paid for half of the professional services rendered, and inquired of the physician as to what his fee would be for the performance of the mastoid operation. Thereafter the patient never returned to the defendant, and subsequently instituted an action for malpractice. The plaintiff however failing to serve a complaint in the case, the action was duly dismissed on motion for failure to prosecute the action with due diligence, thus terminating the action in the doctor's favor.

### TONSILLECTOMY—CLAIMED UNAUTHORIZED REMOVAL OF UVULA

The plaintiff, a young woman, had been suffering for some time with chronic laryngitis and chronic pharyngitis. On the occasion which forms the subject-matter of this action, she requested the doctor to examine her tonsils and adenoids, which he did. He found them diseased and recommended that they be taken out. At this time he also told her that it might be necessary to have her uvula removed. She consented to this, authorizing the doctor to perform such surgical operation under an anaesthetic as he, in his judgment, should deem necessary. Under a general anaesthetic the doctor removed the tonsils and adenoids. The operation was uneventful. At

the operation the doctor saw that the woman's uvula, which was enlarged, was hanging down too low and was obstructing her breathing and passage. He removed the entire uvula at once. There were no complications of any kind, and the patient seemed satisfied and paid the doctor's bill.

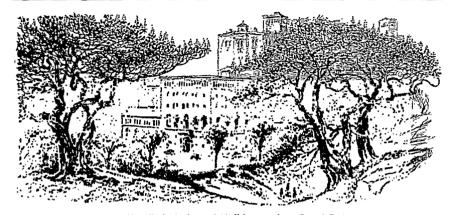

The patient subsequently sued claiming that the doctor had removed the uvula without authorization.

After the case had appeared on the calendar, the plaintiff failed to proceed with the action, and on our motion the complaint was dismissed, thus terminating the case in the doctor's favor.

### NEWS NOTES

The New York Academy of Medicine seen from Central Park.

A Sketch by Dr. R. L. Dickinson, New York, N. Y.

#### PHYSICIANS' ART CLUB

The New York Physicians' Art Club held its fourth annual exhibition of works done by physicians in the plastic and graphic arts from February 15 to March 15, in the building of the New York Academy of Medicine. There were 54 exhibitors from Greater New York and 9 from out-of-town, and a total of 241 pieces were listed. Dr. John A. Hartwell, President of the Academy, in the introduction to the catalogue says:

"A productive avocation is the hall mark of the cultured man. Culture argues a broad outlook on all problems and such an outlook is particularly demanded at the present time for a wise guidance in the trend of advance which the profession is just now called upon to furnish. The Academy takes great pleasure in extending its facilities to the Art Club in the belief that these Exhibitions are one means of elevating the standards of medical practice, an avowed function of the Academy."

Dr. Henry A. Bancel, President of the Club, showed pleasing water colors of scenes on Nantucket.

Dr. Robert L. Dickinson showed sketches done with a fountain pen, and also studies for a new seal of the Academy of Medicine.

Dr. Hermann Fischer showed landscapes printed from linoleum plates.

Dr. Alpheus Freeman showed water colors of scenes on Long Island, including Walt Whitman's home at Huntington.

Dr. I. Seth Hirsch exhibited his own portrait done as a plaster cast.

Dr. Theron W. Kilmer showed photographs of Drs. F. J. W. Greeff, Commissioner of Hospitals of New York City, and Dr. Linsly R. Williams, Director of the Academy of Medicine,

Dr. James A. McCreedy showed a white elephant done in ivory soap, and a woodcarving of a cat called "The Thinker."

or a cat called "The Thinker."

Dr. Charles Jaeger showed gum prints of views of Columbia University.

Dr. Frank Oastler showed photographs of Rocky Mountain sheep and bear.

· Dr. H. S. Patterson exhibited water color views of Arizona deserts.

Dr. J. E. Sweet showed bracelets and brooches fashioned from silver.

Dr. Orrin S. Wightman exhibited photographic portraits.

### THE DAILY PRESS

#### MEDICAL MOVIE FILMS

The New York Herald Tribune of March 21 contains the following description of a new series of moving picture films for teaching surgery:

"The first of a series of twenty-five talking films which will be produced by the College of Physicians and Surgeons of Columbia University for use in instruction was shown at Lloyd's Projection Parlors, 729 Seventh Avenue, yesterday afternoon.

"The picture records how Dr. Clay Ray Murray, assistant professor of surgery reduced a Pott's facture, or in plain English, set a broken ankle. Dr. Murray accompanied his demonstration with a running explanation of what he was doing and why he did it. The action was first shown by ordinary photography and then through the eyes of an x-ray machine. Some parts were represented in slow motion.

"It isn't always possible to show medical students the actual setting of fractures because fractures happen accidentally, at unexpected times," Dr. Murray said. "This talking picture, the first in the world showing the manip-

ulation of a fracture that did not necessitate an operation, will overcome the difficulty."

"He explained that the series of films will cost \$25,000 and represent many types of medicine, including maternity and nervous cases. The money for this work, he said, was

to be raised by popular subscription."

The importance of moving picture films in medical teaching is not to be denied, although it is not that usually supposed. The value of a moving picture is that it enables a student to visualize an operation or action. Much teaching in surgery, for example, is wasted because the student has no concrete mental picture of the parts undergoing operation, or of the succession of the movements in the operation. A student beginning the study of surgery and sitting in the back row of the operating room seats, sees nothing of the actual technique of the operation; but until his brain receives a mental picture which he can recall, he will never understand what a lecturer is talking about. The movie is of special value to the student-beginner in the study of surgery, physiology, and other branches of medical study. (See page 420).

#### CITY GARBAGE ON BEACHES

New York City dumps a large part of its garbage and rubbish in the Atlantic Ocean over twenty miles from land, but much of it soon comes back to the beaches of Long Island and New Jersey. One man discharged from a city hospital with the advice to take life easy and live in the open air as much as possible, occupied a shack on the ocean beach fifty miles out from New York and lived there in comfort the year around, picking up his fire wood and his food from city garbage washed ashore within a city block of his kitchen. He had a quarter of beef and a tub of fish which he had salted down, and plenty of fruit and vege-tables, especially onions. He was almost the last of his race of "Beach Combers" who lived longer and more happily than the sea gulls who contended with him for his table supplies.

There has been much controversy about the course taken by garbage after it is dumped at sea. On July 14, 1929, the Brooklyn Eagle prepared 400 scaled bottles, containing an offer of one dollar reward for the return of each, and

threw them overboard beside a city scow as it dumped its load of garbage. The Eagle of March 18 said:

"Two bottles were picked up on the South Shore of Long Island, and others were later picked up along the Jersey coast. In November the last previous three bottles were reclaimed, one off Selbyville, Del., and two by coast guard men off North Carolina, only a little north of Cape Hatteras.

"Eagle tracer bottle 68 made a "record trip," exceeding that of any other tracer bottle known to him, it was said today by Arthur S. Tuttle, chief engineer of the Board of Estimate.

"The bottle which made this long excursion was picked up in February by a Portuguese fisherman in the Azores, and the blue reward slip inside, offering \$1 for its recovery, was mailed to The Eagle by an American friend of the fisherman, arriving in Brooklyn last Saturday night."

### THE CURSE OF PHARAOH'S TOMB

It is an ancient belief that "Death shall come on swift wings to him that toucheth the tomb of a Pharaoh." An editorial in the Brooklyn Eagle of February 24, comments on the possible relation of the curse to Lord Westbury, who committed suicide after having been prominently connected with the discovery of the tomb of King Tut-ankh-Amen. The Eagle gives the following list of ten others who might have been under the curse of death:—

"He, (Lord Westbury) was the father of the Hon. Richard Bethell, Howard Carter's secretary, whose strange death in London had grievously affected the old peer.

"Carnarvon, who financed the Luxor excavations, is dead. So are Sir Archibald Douglass Reid, who x-rayed the mummy of 'Tut'; Aubrey Herbert, Carnarvon's half-brother, who was present when the tomb was opened; Ali Fahmy Bey shot right after a visit to the Valley of the Kings; Dr. Jonathan Carver, victim of an automobile wreck after such a visit; Jay Gould, whom pneumonia carried off quickly after his visit; Mrs. Evelyn Greeley, who killed herself in Chicago after seeing the mummy; Professor Lafleur of McGill University, who died suddenly after looking at the sarcophagus, and H. G. Evelyn-White, who committed suicide because he thought a curse was on him."

To this list the New York Times of February 26, adds two others. An eight-year-old boy, Joseph Green, was killed by the hearse of Lord Westbury, and Edgar Steele, a worker in the British Museum who handled the relics of the ancient king died after a surgical operation. However, the Times quoted Howard Carter, who opened the Tomb as saying:

"Thousands of people had been indirectly

connected with the Tut-ankh-Amen relics and that there was no record of any overwhelming outbreak of mortality.

"I've handled Egyptian relics myself many times, for years, and I'm still as well as ever."

Superstitious beliefs usually have their origin in facts. An editorial in the New York *Times* of March 14, suggests the following rational foundation for the belief in the curse of ancient Egyptian tombs:

"In a bulletin of the Museum of the University of Pennsylvania Mr. Alan Rowe describes the excavation of an Egyptian tomb dating from about 2800 B. C. A deep passage-way, choked with rubbish, led from the tomb to the outer air. The air in this passage was found to be so bad that workers could continue for only about an hour a day. A short stay in the bad air produced a violent headache, and, after an hour or so, candles went out.

"Lack of oxygen and the presence of monoxide gas, partly from the burning candles and perhaps partly from crevices in the long-scaled chamber, account for the foulness of the air. One who breathes such an atmosphere too long receives no warning of its ill effect, but simply collapses and dies."

When a man is found dead in his garage from carbon monoxide poisoning, there is never any question of a curse being on his automobile or the building that shelters it. But when a similar fate befell the robbers of Egyptian tombs, century after century, it was natural that a supernatural explanation was given for their deaths. A guilty conscience and a lively imagination combined to attribute the misfortunes of tomb robbers to a mysterious curse.

### GORILLA PRESERVES

Those who would understand man find help in observing the gorilla and other animals whose evolution parallels that of man the most closely. Two African sanctuaries have been created in which the gorilla may live unmolest-'ed. The New York Times of March 21 says:

"The time may come when visitors to the Parc Albert will find gorillas as tame as bears in the Yellowstone. Contrary to an early impression, the gorilla walks on all fours, seldom assuming an upright position. When alarmed it beats a hand on its chest to warn compan-

ions of danger. The large gorilla which Akeley "collected" in 1921 was five feet seven and a half inches in height, weighed 380 pounds, and had a chest measurement of sixty inches. "Normally the gorilla," wrote Carl Akeley, "is a perfectly amiable, good-natured creature." He could believe that when hungry and harassed, an old male might be a "bad gorilla." Dr. Derscheid had had thirty-three encounters with the beasts, and only once did he have to shoot. There may have been 650 mountain gorillas in the sanctuary in 1927.

### BOOK REVIEWS

THE PHYSICIAN THROUGHOUT THE AGES. A Record of the Doctor from the Earliest Historical Period. By ARTHUR SELWYN-BROWN, B.SC., M.A., Ph.D., LL.D. Two folio volumes. v. 1, 848 pages, illustrated, 2, 854 pages, illustrated. New York, Clapehart-Brown Company, Inc., 1928. Cloth, \$25.00 per set.

It is our understanding that this work is published in the interest of the Physicians' Home, Inc., the proceeds of sales going to the support of that worthy institution, The fact that these volumes are sponsored by Dr. Robert T. Morris is sufficient guaranty of their value and the validity of their claims upon the profession. The monumental character of the work impresses one, and the many experts who have collaborated with Dr. Sel-wyn-Brown have acquitted themselves ably. Medicine as a part of social development in relation to general historic backgrounds is well presented. It would be inexpedient in our limited space to attempt a detailed consideration of this work's contents, because of the vastness of its scope. Its intrinsic value and the motive for its publication are such that it should be generously supported by the profession, all the more so, perhaps, because of the failure of the American Medical Association to take over the Cancadea Home, not to speak of the I. A. M. A.'s dubious attempt to discredit The Physician Throughout the Ages in its Book Notices.

PRACTICAL HANDBOOK FOR DIABETIC PATIENTS, with 180 International Recipes (American, Jewish, French, German, Italian, Armenian, etc.). By Abraham Rudy, M.D. Octavo of 180 pages, illustrated. Boston, M. Barrows & Company, 1929. Cloth, \$2.00.

rightly, we think, betic patients needs most problem, for he has delieves of all. of text to food values, menus, and cooking recipes, and he might well have devoted the other third to the same subject. For the "didactic" portion, treating of diabetes and insulin, etc., is not so well done as in many a similar work. But with the help of Mrs. Rudy he has done a real service, in gathering the favorite recipes of Jewish, French, German, Italian, and Armenian peoples, and in addition to giving the rules for preparing these, he shows how they may be simply included in a diet expressed in grams

of carbohydrate, protein and fat. This is of far greater importance than a first glance might indicate. The fundamental treatment of diabetic patients rests primarily on a maintenance of morale, and morale is most easily maintained when the patient is disturbed as little as possible in his acquired habits. This manual gives some really new material, and will recommend itself particularly to doctors who are caring for foreign born diabetic patients. L. C. JOHNSON.

PATHOGENIC MICROÖRGANISMS. A Practical Manual for Students, Physicians and Health Officers. Ex Will-LIAM H. PARK, M.D., ANNA W. WILLIAMS, M.D., and CHARLES KRUMWIEDE, M.D. Ninth Edition, revised and enlarged. Octavo of 819 pages, illustrated. Philadelphia, Lea & Febiger, 1929. Cloth, \$6.50.

The 9th Edition of this work is sufficient evidence of its reception and demand as a textbook. The arrangement and presentation, as in previous editions, is simple and logical. The subject matter is presented as fully as possible without burdening the text with controversial material.

The long experience of the authors with their added opportunities of testing methods and technic make the work a valuable reference manual for the practical laboratory worker. The reviewer has advocated and used "Pathogenic Microorganisms" as a practical reference manual in clinical laboratories for the past eight years. The 9th Edition, if anything, is more useful in this field than the president additional to the field than the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the president additional to the past eight years. this field than the previous editions.

Special attention may be attracted to the amplification of the section on immunity which presents an excellent

resume of the recent advances in that field.

As a manual for health officers the book is invaluable, the special experience of the authors in this connection being an obvious advantage in preparing the text and material.

The clear style, omission of unessential details and instructive illustrations should make the book useful to the practicing physician in refreshing his memory of bacteriology, microbiology and immunology in an easy and pleasant manner.

THE ROBERT JONES BIRTHDAY VOLUME. A Collection of Surgical Essays. Large octavo of 434 pages, illustrated. London and New York, Oxford University Press, 1928. Cloth, \$13.00. (Oxford Medical Publications.)

This volume is a collection of Surgical Essays in honor of Sir Robert Jones on the occasion of his seventieth birthday. It is of particular interest to the Orthopedic Surgeon and deals with most of the important subjects in Orthopedics. Each essay is well written and is the result of considerable experience. Each writer is a very definite authority of the subject which he has written for this Birthday Volume to Sir Robert Jones. This volume is worth reading by every member of the Medical Profession because of the diversity of the subjects and because of the allied interest to the various branches of Medicine and Surgery.

RADIUM TREATMENT OF CANCER. By STANFORD CARE, F.R.C.S. (Eng.). Octavo of 158 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$5.50.

This monograph of 153 pages is a summary of the experience of the personal work of the author, at the Westminster Hospital for five years. It does not pretend to be more and is chiefly valuable for its insistance upon and exemplification of a very practical point of view which is thus expressed in the preface:—"If the choice of treatment in a given case of cancer depends upon a surgeon, not conversant with the possibilities of radium, the choice will inevitably be that of surgery; the converse is true, and is applicable to the radiologist. Radium needs a surgery of access and surgery needs radium if the best is to be given to the patient."

The first 24 pages are devoted to discussion of radioactivity, methods of irradiation and the general prin-cipes of radium-therapy. The rest of the book discusses in a rather elementary manner the application of radium to variously situated neoplasms-the buccal cavity, the cervical lymphatic glands, the pharynx and larynx, the

breast, the rectum etc., etc.
The book is adorned with 13 colored plates which are expensive, decorative but not important and might well be replaced by careful and well selected histologic drawings which are lacking. On the other hand the line drawings are original and informative. There is no satisfactory discussion of x-ray therapy, which is only occasionally mentioned. The amounts of radium used are small, the case reports are undated. It is, however, an interesting primer from a British point of view.

### THE CURSE OF PHARAOH'S TOMB

It is an ancient belief that "Death shall come on swift wings to him that toucheth the tomb of a Pharaoh." An editorial in the Brooklyn Eagle of February 24, comments on the possible relation of the curse to Lord Westbury, who committed suicide after having been prominently connected with the discovery of the tomb of King Tut-ankh-Amen. The Eagle gives the following list of ten others who might have been under the curse of death:—

"He, (Lord Westbury) was the father of the Hon. Richard Bethell, Howard Carter's secretary, whose strange death in London had grievously affected the old peer.

"Carnarvon, who financed the Luxor excavations, is dead. So are Sir Archibald Douglass Reid, who x-rayed the mummy of 'Tut'; Aubrey Herbert, Carnarvon's half-brother, who was present when the tomb was opened; Ali Fahmy Bey shot right after a visit to the Valley of the Kings; Dr. Jonathan Carver, victim of an automobile wreck after such a visit; Jay Gould, whom pneumonia carried off quickly after his visit; Mrs. Evelyn Greeley, who killed herself in Chicago after seeing the mummy; Professor Lafleur of McGill University, who died suddenly after looking at the sarcophagus, and H. G. Evelyn-White, who committed suicide because he thought a curse was on him."

To this list the New York Times of February 26, adds two others. An eight-year-old boy, Joseph Green, was killed by the hearse of Lord Westbury, and Edgar Steele, a worker in the British Museum who handled the relics of the ancient king died after a surgical operation. However, the Times quoted Howard Carter, who opened the Tomb as saying:

"Thousands of people had been indirectly

connected with the Tut-ankh-Amen relics and that there was no record of any overwhelming outbreak of mortality.

"I've handled Egyptian relics myself many times, for years, and I'm still as well as ever."

Superstitious beliefs usually have their origin in facts. An editorial in the New York Times of March 14, suggests the following rational foundation for the belief in the curse of ancient Egyptian tombs:

"In a bulletin of the Museum of the University of Pennsylvania Mr. Alan Rowe describes the excavation of an Egyptian tomb dating from about 2800 B. C. A deep passage-way, choked with rubbish, led from the tomb to the outer air. The air in this passage was found to be so bad that workers could continue for only about an hour a day. A short stay in the bad air produced a violent headache, and, after an hour or so, candles went out.

"Lack of oxygen and the presence of monoxide gas, partly from the burning candles and perhaps partly from crevices in the long-sealed chamber, account for the foulness of the air. One who breathes such an atmosphere too long receives no warning of its ill effect, but simply collapses and dies."

When a man is found dead in his garage from carbon monoxide poisoning, there is never any question of a curse being on his automobile or the building that shelters it. But when a similar fate befell the robbers of Egyptian tombs, century after century, it was natural that a supernatural explanation was given for their deaths. A guilty conscience and a lively imagination combined to attribute the misfortunes of tomb robbers to a mysterious curse.

### GORILLA PRESERVES

Those who would understand man find help in observing the gorilla and other animals whose evolution parallels that of man the most closely. Two African sanctuaries have been created in which the gorilla may live unmolested. The New York Times of March 21 says:

"The time may come when visitors to the Parc Albert will find gorillas as tame as bears in the Yellowstone. Contrary to an early impression, the gorilla walks on all fours, seldom assuming an upright position. When alarmed it beats a hand on its chest to warn compan-

ions of danger. The large gorilla which Akeley "collected" in 1921 was five feet seven and a half inches in height, weighed 380 pounds, and had a chest measurement of sixty inches. "Normally the gorilla," wrote Carl Akeley, "is a perfectly amiable, good-natured creature." He could believe that when hungry and harassed, an old male might be a "bad gorilla." Dr. Derscheid had had thirty-three encounters with the beasts, and only once did he have to shoot. There may have been 650 mountain gorillas in the sanctuary in 1927.

# HAY FEVER

### An Advertising Statement

HAY FEVER, as it occurs throughout the United States, is actually perennial rather than seasonal, in character.

Because in the Southwest—Bermuda grass, for instance, continues to flower until December when the mountain cedar, of many victims, starts to shed its pollen in Northern Texas and so continues into February. At that time, elsewhere in the South, the oak, birch, pecan, hickory and other trees begin to contribute their respective quotas of atmospheric pollen.

But, nevertheless, hay fever in the Northern States at least, is in fact seasonal in character and of three types, viz.:

TREE HAY FEVER—March, April and May GRASS HAY FEVER—May, June and July WEED HAY FEVER — August to Frost

And this last, the late summer type, is usually the most serious and difficult to treat as partly due to the greater diversity of late summer pollens as regionally dispersed.

With the above before us, as to the several types of regional and seasonal hay fever, it is important to emphasize that Arlco-Pollen Extracts for diagnosis and treatment cover adequately and accurately all sections and all seasons—North, East, South and West.

FOR DIAGNOSIS each pollen is supplied in individual extract only.

FOR TREATMENT each pollen is supplied in individual treatment set.

ALSO FOR TREATMENT we have a few logically conceived and scientifically justified mixtures of biologically related and simultaneously pollinating plants. Hence, in these mixtures the several pollens are mutually helpful in building the desired group tolerance.

agement of said contemplated activities of said health center, with this restriction, however, that there shall be two committees appointed. The first one as the committee on indigency, and the second as that as health center management, which committee shall be composed as follows, and have the following powers. Furthermore, that we as a society will annually establish a fee for the various types of work rendered by the profession to said health center, which shall be defrayed out of the funds collected from the Civic Organization or money received from the Board of Supervisors for cases properly falling within its jurisdiction and obligation.

"Furthermore, that all members of the Woodbury County Medical Society shall be entitled to have services in said health center prorated as to time and occurring according to their election, but all shall receive the same compensation based upon 60% of usual fee charged for like services in private practice. Furthermore, none shall be recommended to service unless the same is agreeable to them."

### DEFINITION OF MEDICAL PRACTICE IN KANSAS

The March issue of the Journal of the Kansas Medical Society has an editorial discussion on the interpretation and the definition of what constitutes medical practice. It says:

"It is now almost thirty years since the Medical Practice Act was adopted by the legislature of this State. There have been a considerable number of decisions by the Supreme Court as to the validity of its various sections and in the main it has withstood all of these tests. In the section which defines who are practitioners of medicine there are still some points to be authoritatively determined. One point that has been made to bear considerable weight in determining violations of the law is whether a fee is charged or not. One of the exceptions reads: 'Nor shall anything in this act apply to the administration of domestic remedies, nor to prohibit gratuitous services.' There is a decision that the law does apply to the administration of domestic remedies when a fee is charged, but the question now arises as to what constitutes a fee.

"The exemption of gratuitous services opens a wide field for the practice of medicine by those unqualified. And it also raises some questions of interpretation. For instance, it is reported that school nurses not only make diagnoses but administer drugs and vaccinate pupils for smallpox. They do not receive a fee

(Continued from page 418-adv. xviii)

from the pupils for these services but neither can it be classed as gratuitous service since they are under salaries. In a good many hospitals anesthetics are administered by trained nurses, and some of these are quite expert anesthetists. It has not been decided if administering an anesthetic comes within the acts specified as practicing medicine or surgery, but if so does the fact that the hospital charges a fee for the anesthetic, bring it within the provision of the law. It is not gratuitous service nor does the nurse do it for a fee. If the school nurse shall be considered as giving gratuitous service, then the employed medical attendants of industrial hospitals, and physicians and surgeons of insurance hospitals, are also exempt for the same reason.

"With the constant changes and the rapid progress in scientific medicine, preparing laws for the regulation of the healing art for future years is a hazardous undertaking. Forty-five years ago the law providing for the state board of health was adopted. In the section providing for the creation of the board will be found the following: 'But in no case shall the governor appoint a majority of the physicians that shall constitute such board of health from any one school of medicine practice, nor shall said board at any time be composed of persons a majority of whom shall be of the same school of medicine.'

"The law creating the board of registration and examination, passed by the legislature fifteen years later also provides, in the composition of the board, as follows: 'representation to be given to the different schools of practice as nearly as possible in proportion to their numerical strength in this state, but no one school to have a majority of the whole board.'

"It is practically impossible for the governor to comply with either of these laws under the present conditions, but by giving a very liberal interpretation to the term 'school of medical practice' and 'school of practice' he has succeeded in maintaining the high character of the board. No one has raised the question as to the legal standing of these appointees and it is doubtful if any one will, but these laws should be amended to conform to present circumstances at least."

### MEDICAL MOVIES IN ARKANSAS

The March issue of the Journal of the Arkansas Medical Society describes the attractions of the program of the annual meeting to be held on May 6-8, in Fort Smith and continues:

"In addition to the foregoing, there has been arranged a new and very attractive addition to

(Continued on page 421-adv. xxi)

(Continued from rage 420-adv. xx)

the program, consisting of five motion picture films on medical and surgical subjects. Dr. Davis of Chicago will present an obstetrical film; two films on cancer as part of the report of the Cancer Control Committee, by courtesy of Dr. Dewell Gann, Jr., Chairman; two films prepared by the Eastman Kodak Company for the American Col-lege of Surgeons. The latter two will be on 'Infections of the hand,' and 'The Technic of Blood Transfusion,' here has also been arranged for some twenty odd papers by some of the best talent the State has to offer. In regard to the motion pictures that we have arranged for, it is truly a new, attractive and educational feature. The American College of Surgeons says, 'The value of motion pictures for medical instruction, as produced by the Eastman Film, Inc., is gradually becoming more appreciated. For the medical student they can never replace experience gained from personal contact with disease; nor can they supplant well established methods of teaching medicine. But as an adjunct to the methods in vogue at present by facilitating the instruction, conserving the time of students and teachers and by economy of materials are of inestimable value. No one will pretend to claim that surgery can be taught by motion pictures, but motion pictures of certain operations, carefully selected for their adaptability to photography, can demonstrate successfully many of the fundamentals of surgical technic as practised by leading surgeons. Comparisons of differences in the details and mechanics envolved can serve as an introduction to the beginner and lead to a broader and more comprehensive understanding of the subject. By this method the best work can be available to all present and in the future, aside from all historical and sentimental considerations, such records will have a very practical value for posterity." (See page 413).

#### THE MICHIGAN JOURNAL

A report of Dr. J. H. Dempster, Editor of the Journal of the Michigan State Medical Society to the Council is contained in the March issue of the Journal. Dr. Dempster believes in the use of fillers or brief articles inserted on the bottom of pages for the purposes of filling space as is shown by the following abstract.

"The so-called 'fillers' have been selected so as to be not only authoritative but of timely interest. The main source has been the abstracts of articles furnished by the American Medical Association and the scientific summaries furnished by Science Service, Washington. I have endeavored to edit and eliminate any features or phraseology in the Science Service material that would seem perfectly ob-

The

# "Pomeroy Supporting Corset

A good corset, properly made and fitted, not only gives needed support to the vital organs, but moulds the figure to correct and graceful lines.

The Pomeroy is ideal for this purpose, for it is so designed that the uplift is given by the corset itself with no need for additional belt or other contrivances. The intersecting laces give an extra upward and backward lift which further helps the muscles of the abdomen to give the necessary support.

vious to medical readers since the Science Service is intended for cultured readers in all professions and walks of life. These selections are as a rule summaries of papers of a medical interest or near-medical interest that are read at various scientific meetings held throughout the United States and Canada, as well as reports of the results of research.

The New York State Journal of Medicine following the example of an increasing number of Journals of all kinds, does not use fillers, but the editors try to adapt the articles to the pages.

The comparative cost and receipts of the State Journals is always interesting. financial report of the Michigan Journal is found in the same issue and is as follows:

### JOURNAL BUDGET

Income Subscriptions ...... \$ 8,625.00 Advertising Sales ...... 8,000.00

Total .....\$16,625.00

Expenditures:

Printing and Mailing ......\$12,000.00 Wrappers ..... 200.00 Editor's salary and Stenographic 4,250.00 Contingent .....

Total .....\$16,625.00

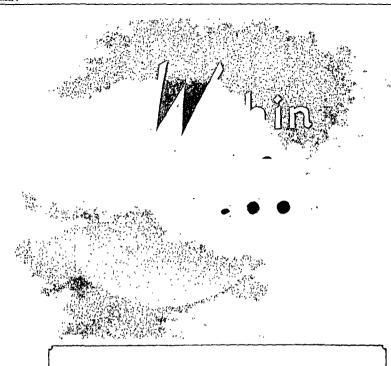

The subscription money is the sum set aside from State dues to make up the deficiency incurred from publishing the Journal. There are 3,463 members of the Michigan State Society and so the subscription charge per member is \$2.50, or one quarter of the annual dues of ten dollars. The editor receives \$2,829.00 as his salary.

### POLITICS AND PHYSICIANS IN THE KNOXVILLE GENERAL HOSPITAL

The control of the medical staff of the General Hospital of Knoxville, Tennessee, is an acute problem according to the following article in the March issue of the Journal of the Tennessee State Medical Association:

"There seems to be some trouble in Knoxville between the management of the General Hospital and the Medical Staff. We print herewith a letter explaining the position of the doctors. Eightyeight doctors have signed this letter as individuals. Most of them or probably all of them are members of the Knox County Medical Society.

(Continued on page 424-adv. xxiv)

ON EMINENT authority, in his treatise on rickets, states that in recent years fully three-fourths of the infants in large cities showed some signs of this disease. Nowadays, the prospects for efficient prevention and cure of rickets are far more promising. This much brighter outlook is due to the discovery of irradiated ergosterol.

Clinical tests on an extensive scale during several years have demonstrated that Vigantol an irradiated ergosterol—is a highly potent antirachitic. In small doses, it prevents the occurrence of rickets, while in developed cases it rapidly establishes normal bone formation and improves the general nutrition. During pregnancy and lactation, its administration is advisable to maintain normal calcium metabolism.

How Supplied: — Vigantol is available in a standardized oily solution. This has 100 times the vitamin D (antirachitie) potency of cod liver oil, two drops being equivalent to one teaspoonful of the latter. Supplied in bottles of 5 cc, and 50 cc, with standard droppers.

# What about taste?

Do you have to apologize for the taste of the medicines you prescribe? Or do your patients still believe innocently that the medicine must be bitter to be efficacious?

Agarol the original mineral oil and agaragar emulsion with phenolphthalein, is for that up to date generation that wants its medicines in the proverbial "sugar coating."

No excuses are needed for its taste anymore than for its effectiveness. Agarol is exceptionally palatable without artificial flavoring. It flows freely from the bottle, and can be mixed with any liquid or soft food.

Just enough mineral oil to carry unabsorbable moisture to the intestinal contents, keep them soft, and so make evacuation easy and painless. By gentle stimulation of peristalsis, Agarol makes the result certain, and aids in reestablishing regular habits.

One tablespoonful at bedtime

—is the dose

Final decision on the true worth of Agarol rests with the physician. We will gladly send a twin package, withliterature, for trial.

# AGAROL for Constipation

WILLIAM R. WARNER & COMPANY, Inc. 4 113 West 18th Street, New York City

#### DOCTOR-

Druggists recently interviewed tell us that between 60 and 70% of those calling for Cod Liver Oil mention no specific name or brand.

May we suggest the advisability of recommending or prescribing by name Nason's Palatable Norwegian Cod Liver Oil to your patients! Doing this, you assure their securing Cod Liver Oil of absolute purity and clarity, pleasantly flavored, and of high vitamin potency.

Your patients are not likely to know of Nason's Cod Liver Oil except through your recommendation or prescription, since this Cod Liver Oil is advertised and marketed solely through professional and

ethical channels.

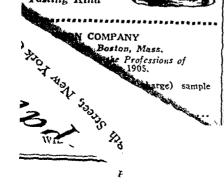

## High Vitamin Potency Plus + Palatability

The vitamin potency of Nason's Palatable Norwegian Cod Liver Oil is warranted to be not less than 800 vitamin A units per gram and not less than 100 vitamin D units per gram. Each lot is biologically tested.

Accepted by Council on Pharmacy and Chemistry, A. M. A.

Nasons Palatable Norwegian

(Continued from page 424—adv. xxiv) personal qualifications and training to make good executive officers. The staff is displeased and disorganization results.

"'Can'the people of Knoxville afford to have the physicians who administer to charity disorganized every two years? If the doctors who have gone to schools, colleges, medical school, taking interne work and post-graduate work, are not capable of governing themselves and knowing how to administer to sick, pray tell us, O Aesculapius, where did a layman with much inferior education and qualification get his wisdom?"

## ANNUAL REGISTRATION IN WYOMING

The Wyoming State Medical Society uses the pages of Colorado Medicine as its official organ. The Wyoming Legislation passed an annual registration law similar to that in New York State which was sponsored by a majority of the doctors themselves. But the Wyoming doctors are mad clear through,—or at least one would gain that impression from reading the following abstracts from the Wyoming section of Colorado Medicine for March:—

"Many a poor youngster has had his heart broken by the dog catcher in the loss of a scrub pup that meant everything in the world to him so far as a pal and companion could mean.

"Last year our all wise State Legislature passed a dog tax, on doctors. This action was engineered through and signed.

"Certainly the members of the medical profession were not informed of this undesirable and annoying tax and it was rushed through the legislature and signed by the governor. He would not for one moment favor such a law applying to his own profession, that of a civil engineer. No, but the doctors must pay one dollar a year to be granted a renewal of their license after paying fifty dollars for them, to practice medicine; like a cigar store to sell cigarettes. Of ye gods! Why did not his all wise bunch see the point and remember their childhood days and make the tax a little more by making the rate five dollars for females as it applies in the case of the dogs? They certainly overlooked a great point in this matter. Perhaps they considered our lady doctors would be less amenable to discipline, but of all the diabolical taxes this is certainly the bunk.

"How do you think the attorneys would swallow such a penny wise and pound foolish policy? They would not stand for it one mo
(Continued on page 427—adv. xxvii)

(Continued from page 426-adv. xxvi)

ment. No, you can't put a pup tax on lawyers, or bankers, judges or even the meek tillers of the soil who generally have to stand anything, but the fool doctors stand for such a graft. And why the tax? Answer: to keep the records in the office of the State Board of Medical Examiners up-to-date. They are so valuable for the insurance companies.

"Here we are, a little poorly populated state, with a county health officer in each county who knows at once when a new doctor arrives. Our state health officer is also the secretary of the State Board of Medical Examiners. He can and ought to get all this information from the county health officers without a dog tax of one dollar on every doctor in the state.

"It is not the amount of the tax, but the principle of the unfair thing that gets under our skins. In the great centers of population such a measure might be needed but out in Wyoming it's the bunk. Everyone will admit that the State Board of Medical Examiners is not worked to death and the secretary has plenty of time to look after unregistered doctors in our state.

"Pay your dog tax April 1st and next fall vote for the spine adjusters for the legislature and quack-loving officers."

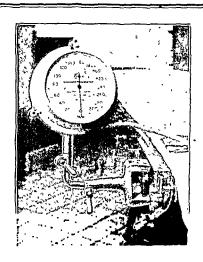

#### "THE BOARD OF HEALTH"

The local boards of health of Nebraska are made up in a peculiar way that is described in the Nebraska State Medical Journal of March.

"The Nebraska law governing boards of health makes specific provision for certain individuals in the membership. The Chairman of the Board of Health is responsible for the performance of the duties imposed on said Board. The Sheriff is Chairman of the County Board of Health. The Mayor is Chairman of the City Board of Health.

"The Quarantine Officer is in each instance the Police Member of the Board of Health. This is essential because quarantine is an exercise of the police power of the state. Not infrequently (and partly as a result of an obsolete law) some physicians attempt to assume authority to establish quarantine—even procuring a card some place and posting it on the premises. A physician could be utilized to post a quarantine card or notice legally by the proper authority deputizing him to do so and the Board of Health supplying the correct card for the time and place, but there is no provision for indefinite deputization or delegation of such authority. It is the duty of the police member of the Board to investigate

## Tycos Surgical Unit

#### For Blood Pressure Determination in the Operating Room

For the convenience of anaesthetists and surgeons, who are finding that accurate blood pressure readings are invaluable during anaesthesia and surgery, we have designed this Tycor Surgical Unit.

It consists of a large easy reading type
The Sphymoner and a universal
the Sphygmo-

convenient for the anaesthetist and out of the way of the surgeons and assistants. The adjustments can be made instantly, but once made the instrument is firm as the table itself. If it is inconvenient to have the instrument attached to the table, the clamp will accommodate it to the anaesthesia equipment or instrument stand.

Modern trends make it extremely important for hospitals to include the Tycos Surgical Unit in their operating room equipment.

Your dealer can supply you with this equipment. Complete unit \$52.50. Clamp only \$15.00. Write today for additional information.

"The Medical Adviser is the technical member of the Board. Therefore, it devolves upon him to perform the epidemiologic work required: To personally investigate and examine persons to establish, or when necessary confirm, the diagnosis of contagious disease; to take cultures from suspected individuals for the Board, and such additional duties as circumstances indicate for the purpose of being enabled to advise the Board upon the basis of personal knowledge, whereby intelligent action can be taken toward safeguarding the health of the community. Diagnosis is practice of medicine.

"All reports of reportable disease will be made to the Secretary of the Board of Health having jurisdiction—in the county this means the County Superintendent, whereas the Secretary in cities or towns is the Chief of Police or Marshall."

## PRESS SERVICE OF THE WISCONSIN STATE SOCIETY

The Wisconsin Medical Journal has a new department called "Press Service" with the motto "No serum does so much for public health as printer's ink." Each issue will contain the press releases for the previous month. These weekly articles have been sent for three years to four hundred newspapers. As a sample of the releases the following of January eighth on Fresh Air may be quoted:—

"Fresh air is not the cause of colds and sneezes. No matter how cold it may be, there should be some ventilation in the sleeping room. Too much coddling of the body gives rise to

more colds than any other element.

"These are among the statements contained in a bulletin issued by the educational committee of the State Medical Society of Wisconsin today. The bulletin urges people, however, not to sleep in drafts and stresses the importance of sufficient bed clothing underneath the body.

"There is more health in winter air than in any other single medical prescription, declares the bulletin of the medical society. With the first drop of the temperature and the first chilly blasts that precede winter weather don't lose your nerve and slam down your bedroom windows.

nerve and slam down your bedroom windows.

"Every night spent in the out-of-doors adds hours to your life if kept up habitually, and if you have a warm place to dress. Many a man who has never slept in the open, who has never experienced the big thrill that results from outdoors sleeping in the fresh air, wakes from his first experiment in amazement. The et and the cowboy sing of the wonder of nights spent in the open, sleeping under the

(Continued from page 428-adv xrvm)

ever, is not alone for those who live in the country and in the open spaces. It is yours to experience almost as well, wherever your home may be, if you will make some balcony or some porch into a sleeping apartment. It may be that you are not fortunate enough to possess such a porch or balcony that can be transformed into sleeping quarters. In that case, you can still avail yourself of some of the benefits that come from sleeping outdoors if you open wide the windows of your sleeping room so that the fresh air of the night can swoop over you.

"All that anyone needs to get from outdoor sleeping is fresh, moving air. It is not necessary that you shiver. It is not necessary that you ondergo discomforts. It is not necessary or advisable to sleep in a draft. The process of adjustment from indoor to outdoor sleeping should be a gradual one; care should be taken always to avoid exposure. Every beginner should take precautions to see that provisions are made for perfect comfort, and it is well for you to see your family physician and have him check up your resistive powers by a thorough physical examination before you start.

"If your head is sensitive to cold, it should be covered with a warm cap. This cap should be loosely knit and so porous as to permit the free

circulation of air. If your feet are sensitive to cold you should provide yourself with woolen bed socks.

"Another important point for the outdoor sleeper to remember is that it is as important to have enough bed clothing underneath the body as it is to have enough over the body."

"The President of our Association has appointed local committees in all those counties where the county societies have expressed a desire to co-operate in this work. All details and arrangements will be left entirely in the hands of the local committees.

"Each local committee will decide whether or not clinics will be held in connection with the

# STUDENT HEALTH — AN OPINION FROM WISCONSIN

Student Health service is receiving an increasing amount of attention in colleges throughout the land. The subject is discussed editorially in the March issue of the Wisconsin Medical Journal.

"Columbia University taken the physical examination of 500 incoming freshmen out of the hands of the Department of Physical Education and put them into the hands of sixteen physicians, who will conduct the physical and mental examina-It is planned subsequently to follow the subject's health through college and use the data secured in the physical examinations in advising scholastic work, athletics, and outside activities. Looking forward still further, the physical findings will be used in connection with vocational guidance,

"This is a significant step-by no means original but particularly impressive because the plan will be backed by an endowment of at least \$2,000,000,00. And it is high time that our great educational institutions take into account the fact that 'the whole child goes to school' and that physical health is no less a matter for concern on the part of educators than high grades in Latin, the Romance Languages, and Mathematics. And while great credit is due to Athletic Departments for what they have done in the past in the way of examining their subjects, health is far more than a matter of musculature

"What Columbia is doing on a two million dollar scale, other educational institutions from kindergarten to college grade can do on lesser scales and according to their means. And large sums of money do not constitute the only, nor the principal means." In Cases of Calcium Deficiency

## DNEUMONIA

## and its treatment with

## Antipneumococcic Serum Lederle

Refined and concentrated as prepared by FELTON

## **ADVANTAGES**

#### Smaller Bulk-

Average volume is about one tenth that of the original serum.

### Minimized Serum Reactions—

Serum reactions are minimized due to the elimination of inert foreign proteins.

### Standardization in Units-

This makes it possible to use the product with more certainty of adequate dosage.

### Procedure

10,000 to 20,000 units should be injected at the earliest possible moment after diagnosis.

Repeat every 8 hours until the temperature falls and beneficial effects are evident. If the disease is severe and the patient very toxic, double the unit dosage at 4 hour intervals.

Antipneumococcie Serum (Lederle) is supplied in syringes containing 10,000 and 20,000 units each of Type I and Type II.

A Treatise on Pneumonia will be sent upon request

## Constipation in Infancy

TILE fact that Mellin's Food makes the curd of milk soft and flaky when used as the modifier is a matter always to have in mind when it becomes necessary to relieve constipation in the bottle-fed baby; for tough, tenacious masses of casein resulting from the coagulation of ingested milk, not properly modified, are a frequent cause of constipation in infancy.

THE fact that Mellin's Food is free from starch and relatively low in dextrins, is another matter for early consideration in attempting to overcome constipation caused from the use of modifiers containing starch or carbohydrate compounds having a high dextrins content.

THE fact that Mellin's Food modifications have a practically unlimited range of adjustment is also worthy of attention when constipation is caused by fat intolerance, or an excess of all food elements, or a daily intake of food far below normal requirements, for all such errors of diet are easily corrected by following the system of infant feeding that employs Mellin's Food as the milk modifier.

## Infants fed on milk properly modified with Mellin's Food are not troubled with constipation

Permanency Tests: Accelerated weathering tests by many competent physicists in this country and in England have confirmed the power of seasoned Vita glass to transmit an effective volume and quality of vital ultra-violet

# OVER 250 Institutions are wholly or partially equipped with

Vita glass windows in Post Graduate Hospital, N. Y. City

More than 250 institutions for the treatment of disease are wholly or partially equipped with Vita glass. And from those in the latter class an impressive number of orders for repeat installations is being

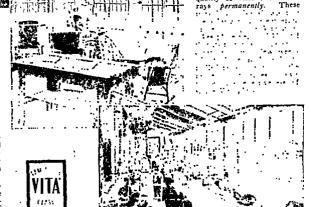

The biological tests made with seasoned Vita glass all indicate that its use will produce anti-rachitic results and normal growth on rats and chickens. Most of these tests have been carried on during winter months and in large cities.

There are two ways to test the transmission of health window glass — the physical method and the biological methods. One method demonstrates the quantity and the other both the quantity and quality of transmission and its effectiveness.

Vita glass has been subjected to accelerated weathering tests many times by the Bureau of Standards, Professor Stockbarger of Massachusetts Institute of Technology and many other physicists. These physicists all confirm that the solarization (weathering or seasoning) of Vita glass takes place very quickly and

that within a few weeks in actual use its transmission of the health ultra-violet becomes stable and permanent without further change.

But more important during the past five years that Vita glass has been in general use, its effectiveness has been tested and proven by many competent medical authorities. Among these are: The Council on Physical Therapy, American Medical Association; Dr. Roger H. Dennett, Post Graduate Hospital, New York City; Dr. Walter H. Eddy, Teachers

Sunlight streaming through Vita Glass accelerates the recovery of child patients at the Peabody Home at Newton Center, Mass.

College, Columbia University, New York City; United States Army Medical Corps, Washington, D. C.; University of Wisconsin, Madison, Wis. and Pennsylvania State College, Pennsylvania. All these tests have shown positive results.

We will gladly send you a summary of these tests or any of the actual reprints, upon receipt of the coupon below.

## IN PRODUCT SQUIBB'S VITA

Since the earliest research on vitamins, E. R. Squibb & Sons has been actively engaged in studying the importance of these factors to the physician. Squibb was among the first to develop products which contained these factors for prophylactic and therapeutic uses. Squibb Vitamin Products are available for almost all professional needs. Here at a glance are given their content and use.

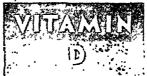

## **SQUIBB'S** VITAVOSE DEXTRO-VITAVOSE

palatable maltose-dextrin preparation, exceedingly rich in Vitamin B and assimilable iron salts. Stimulates the appetite. For modification of milk in infant feeding, and as a diet supplement.

# **SQUIBB'S**

A sweetened and readily soluble form of Vitavose in which the carbohydrate (dextrose) content has been materially increased. For the modification of cow's milk for very young infants, especially those with gastrointestinal disturbances.

## SQUIBB'S VIOSTERO

IN 01L-100 D

A specific for rickets, tetany, osteomalacia. Irradiated ergosterol in Oil, guaranteed to contain 100 times the Vitamin D potency of Cod-Liver Oil, as defined by the Wisconsin Alumni Research Foundation.

## **SQUIBB'S COD-LIVEROIL** WITH VIOSTEROL 5D

Squibb's regular Vitamin-Tested and Vitamin-Protected Cod-Liver Oil with the Vitamin D content increased by the addition of Viosterol so that it has five times the antirachitic strength. of standard codliver oil.

Serenium Squibb — A new product for the oral treatment of Genito-Urinary Infections. Combines low toxicity and high bacteriostatic activity.

All Squibb Vitamin Products are accepted by the Council on Pharmacy and Chemistry of the A. M. A.

# A Normal Colon in a

## HEALTHY BODY

NTESTINAL poisons and disease-producing putrefaction do not flourish in a normal colon.

In infancy Nature provides protective agents in the form of benign friendly germs, notably the B acidophilus and bifidus

Under normal conditions in the adult the presence of these organisms in the intestinal tract helps to suppress putrefaction and protect against disease

And now recent research shows how normal conditions can be restored by changing the intestinal flora

According to the experiments of Distaso, Torrey and others, this can best be accomplished by feeding certuin carbohydrate foods notably lactose and dextrin

The good qualities of lactose and dextrin without their objectionable features have been combined in the therapeutic food—

## Lacto-Dextrin

The book, 'The Intestinal Flora," tells how to use Lacto-Dextrin, and how to combine its use with the plant seed Psylla (plantago psyllium) in certain types of obstinate cases

#### THE KIDNEY IN HYPERTENSION\*

By ALFRED M. WEDD, M.D., CLIFTON SPRINGS, N. Y.

THE purpose of the present communication is to consider the status of the kidneys in hypertension. Many individuals who are found to have elevated blood pressure are told that they are suffering from Bright's disease, with the implication that the trouble is essentially renal. However, careful study will show that what is so often called Bright's disease is really Gull and Sutton's disease, and the renal involvement is merely one phase of a general vascular affection. Exact classification of individual cases from clinical data in a large series of hypertensive patients is not always possible, but the largest single group will be found to include those suffering from the disease which the late Sir Clifford Allbutt called hyperpiesia. This is also commonly known as essential hypertension. By Huchard it was called pre-sclerosis, and by Mahomed, pre-albuminuria, to indicate later developments in the course of the disease.

A new era in the study of renal pathology may be said to have begun with the appearance in 1914 of the now classic monograph of Volhard and Fahr, Die Bright'sche Nierenkrankheit. authors divided the nephropathies into three main The degenerative diseases, or B. The inflammatory diseases, or various forms of glomerulonephritis. C. The arteriosclerotic diseases, the nephroscleroses. The essential feature of their classification and subsequent modifications of it offered by others is the sharp differentiation of primary injuries to specific renal tissues from those of vascular origin. The relative importance of the vascular group may be indicated by the statement made by Romberg in 1925 that for a given period there were seen in his clinic 656 cases of arteriosclerotic kidney disease and only 58 cases of glomerular nephritis.

Concerning the inter-relations of hypertension, nephritis and arteriosclerosis three definite facts may be stated: (1) Either arteriosclerosis or true nephritis may occur without previous hyper-

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 4, 1929.

tension. (2) Hypertension may be present with slight renal or vascular change. (3) There is no quantitative relation between the degree of hypertension and the extent of the renal lesion. As to arteriosclerosis, there is much experimental and pathologic evidence that it can be produced by hypertension. And to these considerations, in any study of hypertension, there must be added that of the functional state of the myocardium because of the inter-relation between myocardial and renal function.

To illustrate some of the questions involved I have analyzed the records of 200 patients whose common attribute was high blood pressure. The age and sex incidence for these are shown in Table 1. The figures for age incidence are of significance only in a general way for they give the ages when these patients were first seen by the writer. Although such figures tell nothing of the duration of the hypertension, they do indicate the periods when active symptoms are most frequently encountered. The period of known duration of elevation of blood pressure varied from two to twenty years. The actual duration of hypertension is known in only a few instances. Examples will indicate the variation in individual cases: The youngest patient was 26 years old when first observed; his condition was good at that time although the presence of hypertension had been known for 12 years. In another, the entire course of the disease was run in 12 years, with death from cardiac failure at the age of 38 years. One woman died from coronary occlusion whose pressure had been elevated for two years. Two patients, a man and a woman, died from cerebral hemorrhage at the age of 71, and in each the pressure was known to have been high for 17 years. The sex incidence of the series shows that 60 per cent were males and 40 per cent were females. No patients have been listed unless several blood pressure determinations were available, and each patient at some time had a systolic pressure of 180 mm., or higher. The first reading was usually the highest. Except in terminal cases a fall in pressure always occurred during

the period of observation. This varied in individual cases, the range being from 20 to 100 mm. in the systolic, with a relatively smaller fall in the diastolic.

When attempting to evaluate observations on renal function in hypertensive patients, one must constantly take into consideration the question of the adequacy of myocardial function at the time of making the tests. Myocardial insufficiency may at times be responsible for what appears to be purely renal failure, and this results the more readily when there is extensive vascular change in the renal bed. The presence of albumin and casts in the urine is not pathognomonic of true nephritis; the presence, as well as the quantity of these substances, may be conditioned by passive congestion of the kidney. The renal function tests used in this study, in addition to examination of the urine, were the two-hour excretion of phenolsulphonphthalein (intramuscular injection) and the determination of the urea or of the total non-protein nitrogen in the blood. A two hour output of the 'phthalein of less than 40 per cent indicates relative renal impairment. A definite increase above normal values for non-protein nitrogen in the blood means absolute renal insufficiency.

Important information is obtained from the usual routine examination of the urine. With few exceptions, specimens of urine from these patients showed a specific gravity of at least 1.015. The urine of 28 patients was entirely negative during the period of observation, and that of 20 patients contained merely a trace of albumin but no casts. Of these 48 patients, several were known to have had hypertension for 5 years or more. For the majority of patients the usual urinary findings were a trace of albumin and a few casts. Albumin increased when myocardial insufficiency appeared. Hyaline casts were most common; in many urines there were granu-

lar casts as well. The urine specimens of three patients contained large waxy casts, the so-called renal failure casts. One of these was clinically a definite case of essential hypertension who died within a few months from cardiac failure. Necropsy was performed in the other two and the renal lesion was that of arteriolar sclerosis. Red blood cells were found in some cases, later proved to be of vascular origin. The two-hour phthalein test was not done in all cases; it was omitted in some office patients who were quite well, and in some in whom the degree of cardiac failure was so marked that the figures would not have been significant. In 89 patients the output of the dye was over 40 per cent for two hours, and in 36, it was over 30 per cent. It must be emphasized that the 'phthalein test may be as much a test of myocardial as of renal function, for the excretion of the dye is governed by the blood flow through the kidney due to the pumping action of the heart, as well as by the available vascular bed of the kidneys; an increase in the output of dye amounting to as much as 75 per cent may occur after treatment directed to improving myocardial function. Definitely high blood nitrogen figures were seldom found when the 'phthalein excretion was more than 30 per cent for two hours. Blood nitrogen values also fluctuate with the condition of the myocardium. Certainly, nitrogen retention is more common and higher values are found in cardiac failure secondary to hypertension than in that secondary to rheumatic valvular disease or coronary artery disease not associated with high blood pressure. This results from the greater degree of renal involvement in the hypertensive cases. As a rule the degree of nitrogen retention seen in the terminal stages of hypertension with cardiac failure is not as great as that encountered in the end stages of true nephritis. Reduction of blood nitrogen values may result from treatment in the hypertensive cases such as seldom occurs in nephritis. For the present group of cases it may be said with certainty that 75 per cent of the patients had adequate renal function at the time they were observed, and that was, for the most part, after at least 5 years of definitely high blood pressure.

The differential diagnosis between nephrosclerosis and chronic glomerulonephritis may be difficult or even impossible. This is particularly true when the early history of the disease is not known, or when patients are seen for the first time in the terminal stage. This difficulty may be as great for the pathologist as for the clinician. Chronic glomerular nephritis is always a sequel to acute nephritis. However, as a result of the "obligatory hypertension" (Volhard and Fahr) that follows, considerable vascular change may result, and, depending on the duration of life, varying degrees of arteriolar sclerosis will be seen in the histologic picture. On the other hand, probably as the result of terminal ischemia, the true hypertensive kidney may show some of the exudative and proliferative changes characteristic of true glomerular nephritis. In true nephritis the urine usually contains larger amounts of albumin and blood cells, and the non-protein nitrogen of the blood shows higher values than are met with in the nephroscleroses. Also, anemia is more marked in nephritis. However, the blood examination may err in either of two ways. Secondary anemia may be exaggerated by the toxic action of retained nitrogen products; this has been seen in cases later proved to have been of vascular origin. Or, high values for both haemoglobin and erythrocytes may result from concentration of peripheral blood due to myocardial insufficiency. The most important criterion for differential diagnosis seems to be definite knowledge of long standing hypertension. If this has been present for five years or more, the probability increases that the condition is the result of a vascular lesion which has been caused by high blood pressure, although the clinical picture may be that of true nephritis. This is not to deny that glomerular nephritis may run a course as long as ten years. In the present series there were seven patients whose haemoglobin was 66 per cent or less. Of these, four were centainly examples of hyperpiesia. In the entire group there were only nine cases for which a diagnosis of chronic glomerular nephritis could be justified, but in only two of these was necropsy performed. Three were women in whom it appeared that chronic glomerular nephritis had followed pregnancy. Even erring in favor of nephritis, of these 200 patients with hypertension probably not more than 5 per cent were suffering from primary renal disease.

The manner in which death occurred is known for 57 patients, and necropsy was performed on more than half of these. Cardiac failure dominated the end picture in 21 instances. For

23. death was the result of vascular accident: there were 10 cases of coronary occlusion and 6 cases of cerebral hemorrhage; seven cases of sudden death were probably due to either coronary or cerebral apoplexy. In ten cases the terminal state was apparently that of renal insufficiency, In most of these the lesion was a true nephrosclerosis; one patient had choked discs and blindness before death. From the study of a large series of cases in which the clinical picture and chemical examinations of the blood are correlated it seems quite certain that the clinical syndrome described by the term "uremic coma" is caused by cerebral edema, and not directly by retained nitrogenous metabolites. One patient died suddenly and necropsy failed to reveal the immediate cause of death; this patient had had auricular fibrillation and it is not unreasonable to assume that death resulted from fibrillation of the ventricles. Two patients, one of whom had had a coronary thrombosis, met death by their own hands.

Five case histories that illustrate the points that have been emphasized are appended.

#### Conclusion

In any large series of patients suffering from hypertension the incidence of primary renal dis-The preponderant ease is comparatively low, renal lesion is a vascular one. As result of the teaching that high blood pressure is only a symptom, too much stress appears to have been laid on the kidneys in seeking the etiology. In reality, the renal lesion is more often a result than a cause of high blood pressure. Although in the late stages, the differential diagnosis of nephrosclerosis from glomerulonephritis may be impossible or of no moment, in the early stages of hypertension the differentiation is of more than academic importance. The too common practice of labelling a patient who has hypertension, with albumin and casts in the urine, as a case of Bright's disease and advising him to stop the use of red meat, means, in most instances, to recognize only one phase of the problem.

Exact classification of individual cases of hypertension is not always possible, but the largest single group comprises those suffering from hyperpiesia or essential hypertension. The almost countless theories that have offered to explain this malady on the basis of physico-chemical, disturbed endocrine, or neurogenic factors, or hereditary influence, have been found wanting. Until specific knowledge has been obtained it is necessary to adopt a concept of blood pressure disease and continue the search. And, until a specific controlling agent has been produced it is only by modifying the activities of these patients so as to obtain the greatest possible number of hours of relatively low blood pressure that their lives can be prolonged. G. Fahr (of Minneapolis).

from a study of American mortality statistics has estimated that at the present rate 140,000 persons will die annually from the various manifestations, cardiac, vascular, or renal, of hypertensive disease. No one can doubt that this question of essential hypertension presents one of the outstanding problems of individual preventative medicine of today.

#### CASE REPORTS

Case 1. The majority of patients, who have long suffered from hypertension, present in their final illness a clinical picture which is a combination of cardiac and renal insufficiency. This case is unique in the complete absence of signs of congestive heart failure. The patient was a man 59 years of age. For ten years his blood pressure had been high, but he had continued in good health until four months before death. His illness began in February, 1928, with nausea, vomiting and delirium. He improved after two weeks' rest in bed and returned to work. He came to the hospital on May 26th, 1928, again suffering from severe nausea and vomiting. The eyelids were The skin was generally sallow. In the fundi, the disc margins were obscured; the arteries were very tortuous and there was a recent hemorrhage in the left eye. The heart was large but there were no signs of myocardial insufficiency. The peripheral vessels showed marked sclerosis. The blood pressure was 225/142. The haemoglobin was 65 per cent and the erythrocyte count was 4,250,000. The specific gravity of the urine varied from 1.014 to 1.017; albumin was 2 plus; there were hyaline and granular casts, many leucocytes, and a few erythrocytes. On admission, the blood urea nitrogen was 26.7 mgs. Two days later the blood pressure was 260/160 and the urea nitrogen had risen to 32.2 mgs. Nausea and vomiting continued. On May 28th, following a collapse convulsive seizures and finally coma occurred, which ended in death the next day.

Necropsy was performed at once. There were small quantities of free fluid in the abdominal, left pleural, and pericardial cavities. The viscera did not show passive congestion. weighed 700 grams. The wall of the left ventricle was 3 cm. thick. The coronary arteries showed considerable calcification. The aorta throughout was quite smooth. Each kidney weighed 150 gms. The capsule stripped rather easily, leaving a gray granular surface. Numerous cysts were present. The average width of the cortex was 4 mm. There was a large amount of fat in the kidney pelvis. Microscopically, the outstanding lesion was arteriolar sclerosis. There were areas of fibrous connective tissue with round cell infiltration and in which numerous obliterated glomeruli could be found.

Case 2. This case is believed to be similar to

the first but anatomical studies are wanting. The case is cited to show the fluctuations in the non-protein nitrogen which occurred during the period of observation. Such changes are usually seen only with renal damage which is secondary to obstruction, as in prostatism. They are seldom encountered in glomerular nephritis. The fall in urea nitrogen is offered as the principal evidence that the renal lesion in this case was primarily vascular. The patient was a man of 49 years. The duration of hypertension is not known. For six months he had suffered from headaches which usually occurred in the after-

noon, but he had continued at his law practice. The heart was greatly enlarged. The cardiac rhythm was that of auricular fibrillation which had not been controlled and the apex rate was 122 when the patient was admitted to the hospital. There were, however, no signs of congestive failure. There was moderate sclerosis of the palpable vessels. The haemoglobin was 86 per cent and there were 5,060,000 erythrocytes. The specific gravity of the urine varied from 1.009 to 1.015; albumin was 2 plus. There were coarse and fine granular, and waxy casts, together with a few leucocytes and erythrocytes. The blood pressure readings and the renal function tests are given in Table II.

At no time did this man seem as ill as one would expect with this degree of urea retention. By the end of six weeks his improvement was as striking as it was unexpected. In October he caught a severe cold following which he failed rapidly and died early in December, 1928.

Case 3. The patient was an unmarried woman 45 years of age. She had known that her blood

pressure was high for five years. Four years before the final illness she suffered from a cardiac breakdown. Following that her usual blood pressure was 220 mm., systolic. Five days before admission to the hospital, May 31st, 1927, she began to have nausea and vomiting; not even water could be retained. It was said that for eight months, following a cold, her kidneys had been bad. The course was one of progressive cardiac failure, of which extreme engorgement of the liver was the outstanding sign. Death occurred on June 30th, 1927, after the patient had been for four days in typical "uremic coma." The peripheral vessels showed marked sclerosis. retinal arteries were tortuous and there was a small hemorrhage in the left fundus. The haemoglobin of the blood was 76 per cent and there were 4,630,000 erythrocytes. The specific gravity

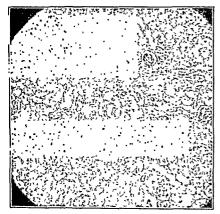

Figure 2
A section of the kidney of Case 3.

of the urine varied from 1.009 to 1.010; the albumin was reported 2 plus; there were always a few red cells, many leucocytes and casts, both hyaline and granular. The blood pressure and the renal function studies are given in the accompanying table. (Table III)

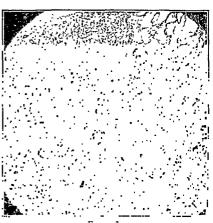

Figure 3
A section of the kidney of Case 4.

At necropsy the principal findings were in the heart and kidneys. There was extensive passive congestion of the viscera. The heart weighed 400 gms., and the muscle appeared normal. The left ventricle was 15 mm. thick. The aorta and

the coronary arteries were practically normal. The left kidney was of about normal size. The right one was quite small. The capsule stripped with difficulty, leaving a dark mottled granular surface. Microscopically, the increase in fibroust tissue was not great. The larger vessels showed intimal sclerosis and there was extensive arteriolar sclerosis. There were many obliterated glomeruli. The tubules were irregular in size and many contained debris. But on the whole there

appeared to be many units capable of function and there was much less damage than was seen in the kidney of the first case.

Case 4. The patient was a man of 50 years who had been well until six months before admission to the hospital. At the beginning of his illness he suffered from substernal pain, referred to the arms, and constriction in the chest. When first seen his principal complaint was weakness. Slight muscular twitchings were constantly pres ent. The first blood pressure reading was 175/95 (Dec. 26, 1927); two days later the pressure was The haemoglobin was 56 per cent and the erythrocyte count was 3,030,000. The specific gravity of the urine varied from 1.006 to 1.012; albumin was reported as one or two plus; there were many red blood cells, leucocytes and hyaline, granular and waxy casts. Only a trace of 'phthalein was excreted. On Dec. 28th, 1927, the blood urea nitrogen was 154 mg: per 100 cc. By Jan. 3rd, 1928, this had risen to 263 mg. and it stood at this level ten days later. There were no signs of myocardial insufficiency. The periph-

Figure 4
A section of the kidney of Case 5.

cral arteries were sclerosed. The retinal vessels showed marked sclerosis and there were recent hemorrhages in each fundus. An x-ray film showed a high degree of calcification of the arteries of the pelvis, and also of the superficial and deep femoral vessels. Death occurred on Jan. 20th, 1928, three days after a sharp fall in blood pressure which marked the onset of coma.

At necropsy there was a mild grade of passive congestion of the liver, spleen and stomach. The

heart showed hypertrophy of the left ventricle. There was an area of calcification at the root of the aorta just above the sinus of Valsalva which greatly reduced the orifice of the left coronary artery. The left kidney weighed 160 gms. and the right, 175 gms. Structurally they were similar. The capsule was stripped with difficulty and left a finely granular surface. The cortex was thin. Microscopically, there was a great increase of fibrous connective tissue, especially in the cortical area. Tubular damage was extensive. Many glomeruli were obliterated and had become hyalinized. Few intact glomeruli remained. The larger vessels showed medial sclerosis and there was widespread arteriolar thickening. So diffuse was the process that it seemed as though a large part of the glomerular damage had occurred at one time. The histologic picture, however, was not typical of chronic glomerular nephritis. From sections of the kidney alone it was not possible to tell whether there had been a superimposed inflammatory glomerular lesion or whether the entire picture was the result of arteriolar and arterial sclerosis. view of the advanced changes elsewhere in the body, the latter interpretation seems preferable.

Case 5. This patient was a woman 63 years old. She states that at 28 years of age she had suffered from acute nephritis following pregnancy. Her blood pressure had been 180 mm. systolic, or higher, for the past thirteen years. In May 1924, her principal complaint was nervousness and the blood pressure then varied from 250 to 180 mm., systolic, and from 120 to 100 mm., diastolic. The specific gravity of the urine was as high as 1.020. Traces of albumin and casts were always present. The two-hour 'phthalein excretion was 52 per cent and the blood urea nitrogen was 13.3 mgs. In September 1925, she made a second visit to the clinic. The range of systolic blood pressure was then from 220 to 160 mm. and from 110 to 90 mm. for the diastolic. The haemoglobin was 79 per cent and the erythrocyte count 4,370,000. The specific gravity of the urine varied from 1.006 to 1.021; a trace of albumin and casts was still present. On Octo-Ler 7, 1925, the blood urea nitrogen was 30.8 mgs. On October 10th, the 'phthalein excretion was 28 per cent for the first hour. These tests were not repeated. On December 2nd, the blood pressure was 160/100 and the patient's general condition was much improved. Two days later she died from a cerebellar hemorrhage in the left hemisphere, which had spread into the fourth, third, and lateral ventricles. The kidneys were small and granular and microscopically showed lesions typical of arteriolar and arterial sclerosis. Many apparently normal glomeruli remained.

## COMMON DISABILITIES OF THE FOOT. THEIR DIAGNOSIS AND TREATMENT

By ARMITAGE WHITMAN, MD, NEW YORK N Y

O regard the various disabilities of the foot in their true relation to the individual, one must take into consideration the traditional and social influences which litherto have militated against their proper treatment

Nothing infurities an orthopedic surgeon more than to be taken for a foot specialist. The term orthopedic is derived from the Greek—"Orthos" and "Pais"—meaning respectively "straight" and "child". The latty, and indeed many others, confuse it with the Latin "pes" for foot. The orthopedic surgeon who has devoted years to the mastery of bone and joint surgery is naturally annoyed at being confused with that low her product of education, the chiropodist. There is, however, an undeniable implication that there is something faintly disreputable in any connection with the foot.

This springs from the earliest days of Roman The foot in those days had two functions, useful and ornamental Society was divided along these lines The term for knight or aristocrat was 'equester," a man who rode a The term "chivalry" with its vast impli cations and ramifications into all aspects of so ciety, means "chevalerie," or horseback riding To the aristocrat, who rode a horse or was carried in a litter, the feet were simply a neat finish to a gentleman, and were clad in shoes whose shape was dictated solely by fashion, as may be seen by inspecting the armor in the Metropolitan Such a man rarely had trouble with Museum his feet because they were never used for working purposes Thus foot troubles being confined solely to the "vulgus" or mob, very shortly be come associated with the adjective "vulgar," which has up to the present remained attached to them

Originally an offshoot of the priesthood and consequently the second most dignified and mysterious of professions, during the middle ages the medical profession sink into complete ignorance and obscurity, a stite from which it has only comparatively recently emerged. In England, for instance, it was only about 1550 that the surgeons separated from the birbers. Thus they too are sensitive about their lowly origin and shrink from association with anything remotely connected with the vulgar

When I was a House Surgeon, sixteen years ago, all injuries and infections of the hand were regarded as minor injuries and were treated by the House Surgeon in the Accident Room, to be referred next day to the Out Patient Department Under that system it would have been possible though not probable, for Kreisler or Paderewski

\*Real at the meeting of the Lifth District Branch at Water town N Y on October 17 1929

to have suffered a complete division of the ten dons, blood vessels and nerves to his right hand and have received his initial operation and treat ment at the hunds of a member of the House Staff. Under the same system the humblest negro laborer presenting humself at the door of the hospital with the unromantic complaint of haemorrhoids was received into the wards, carefully prepared for operation the next day, and was operated on in the main operating amphithentre with full aseptic precautions, if not by the Attending Surgeon himself, at least under his sipervision

A year or two before that time a book was published called 'Infections of the Hand" by Dr Kanvel of Chicago The various possibilities of infections and injuries of the hand were pointed out and in a comparatively short time surgeons began to see that to a man in al most any walk of life a disability of the hand was a serious matter. The result has been that in the most advanced hospitals hand injuries and infections are now regarded as major surgical conditions.

A disabled hand a person may still put in a sling, or in his pocket and get about to earn his hiving. If inflammation shows signs of sprending and if his doctor tells him to he may even go to bed in order properly to take care of it, because everybody knows that hand infections are serious things.

A person with a disabled lower extremity cannot get about at all If his disability is not complete and all he suffers from is pain, the effect upon his or her disposition is immediate and severe. Ask anyone who has ever disputed with a fat and angry cook or a peevish traffic police man.

The fashion of the privileged class—the eques trians—of clothing the foot according to the momentary dictates of fashion rather than according to the purposes for which the foot was used—his been aped by all classes. The result is that we now see sales girls and elevator operators in department stores standing all day in the same pointed toes and high heels that ladies of the more privileged clases were to dine and dance

As more people of all classes are becoming engaged in more and different occupations it may come to be recognized that the foot is important. If the Rotary Clubs were to take it up and start a slogan such as "Teeble feet make futile people" the revolution might be instantaneous.

Regarded from a business point of view the man or woman whose feet are one long ache and who cannot move from place to place without a dreaded effort, is no asset to my organization. sales girl who is comfortable is likely to have such a smiling face that one forgets to look to see that her feet are fashionably clad. Under such a happy change disabilities of the foot might become complaints that patients would not be ashamed to have, or the doctor be ashamed to treat.

In such an unaccustomed atmosphere of optimism let us then consider in the simplest possible terms the major disabilities that affect the foundation of the body—the foot.

These are (1) the weak, or flat foot, (2) depression of the anterior arch, contracted toes, anterior metatarsalgia or Morton's toe, (3) Hallux valgus, or bunion. Paralytic or congenital deformities and fractures and dislocations of the foot are readily recognized and are referred to the specialist. They therefore do not come within the scope of this paper.

At the Hospital for the Ruptured and Crippled the term "flat foot" has been abandoned. For it is substituted the term "weak foot." We no longer believe that the height of the arch is of great importance in relation to the efficiency of the foot. A perfectly flat foot may give the patient no discomfort, while a high arched, racehorse type of foot may cause its owner agony.

Considering the foot as the foundation of the body and considering it in its proper relation to the general posture of the body we may say that it has two attitudes, the attitude of activity and the attitude of fatigue. In the first the feet are held parallel, the toes pointing neither in nor out, in line with the leg. The body weight thus falls downward through the leg, through the center, or slightly to the outer side of the foot. The body balances upon the center of the foot, held in position by muscular activity. The tibialis anticus and posticus and the flexors of the toes actively support the arch in conjunction with the passive support of the ligaments.

In the attitude of fatigue we may assume that the muscles, exhausted, have given way and the arch of the foot is supported by the ligaments alone. In this attitude the toes are turned out, in the familiar position demanded by the dancing teacher, and by our grandmothers who brought our mothers up to "turn their toes out like a lady." The body weight then falls on the inner side of the foot, the weak side. The astragalus, the pivotal bone around which all the movements of the foot take place, rolls downward and inward off the ososcalcis and rests upon the long plantar ligament. If this attitude becomes habitual, not only in standing but in walking, the ligament progres-A bulge, representing the sively gives way. head of the astragalus, appears upon the inner aspect of the foot. What should be the hollow arch becomes bulging and flattened, and if the deformity persists unchecked the foot eventually becomes flat.

The symptoms to which this gradual deforming process gives rise are many and various. Their name may truly be said to be legion. If I may impress this one point upon this audience I may be said to have done a real service to Northern New York. If an orthopedic surgeon in consultation with a general practitioner suggests that a weak foot may be responsible for a backache, his suggestion is likely to be met with a more or less polite raising of the eyebrows—the inference being that the feet are too far away from the back to be responsible for any of its disabilities

Suppose, however, that for no known cause a crack appeared in the ceiling of the top story of a house. A plasterer who had been brought up in an earthquake country would look first at the foundation of the house to see whether or not it was out of plumb. Anyone can appreciate that a shifting of the foundation would explain a crack in the ceiling. If I succeed in impressing on the profession that the feet are the foundation of the body and that their inspection should be part of the routine physical examination I shall have begun to do for the foot what Dr. Kanavel by his book did for the hand.

In general, weakness of the foot is accompanied by a slow and usually unremarked change in the patient's habits. Where once he ran he now walks. Where once he walked he now takes a car. Where he stood he sits. Where he smiled he snaps. His wife, instead of anticipating his return, dreads it. These general symptoms are more likely to be encountered in women than in men as their occupation is usually more sedentary. As their years advance they tend to grow fat, as their weight increases their feet hurt. The more their feet hurt the less they exercise. The less they exercise the fatter they get, and so the vicious circle goes.

Remarks upon diet in a paper on the feet may seem somewhat out of place, but the public in general does not recognize the very direct effect that overweight—plain fat—has upon the feet, and general condition. Habits of eating are formed young. A man who rowed upon the crew in college and accordingly habitually ate large quantities of beefsteak and potatoes carries that dietary habit to his office in Wall Street, where his exercise consists in walking from his desk to the ticker. Then he wonders why his waist line bulges, why he puffs on stairs, and why his feet hurt, and his wife wonders why he fell dead in his early forties on the threshold of a brilliant One useful lesson that experience with career. the British army taught me was the importance of, and the feasability of, rationing. Troops in the front line got all the food they could eat. Those in the zone of the advance a little less. Those at the Base much less. I often wondered morosely whether civilians in England ate anything at all. If men and women were rationed

according to the amount of their physical activity their general constitutional improvement would be amazing

Aside from these generalities what are the chief complaints of the patient suffering from weak feet? First, a general sense of fatigue, of disinclination to effort, of unwillingness to move from place to place. Pain in the calves of the legs, usually increased by walking or standing Continuous aclung, severe pain in the region of the longitudinal arch of the foot, intensified by standing. Pain in the back, most frequently in the lumbar region. Awkwardness and slouchness of gait and general posture. Frequently pain in the heels, caused by the heavy, jarring lied walk. I have already referred to the profound changes which may be effected in the patient's disposition.

The question of diagnosis may be greatly simplified if we regard the foot as a machine, and make the diagnosis from the pragmatic stand point of function. The first consideration is not —"does a given foot conform to what we conceive of as ideal' because no two feet are alike—but "does the foot work to its owner's satisfaction?"

Observe the patient's gait. Is it heavy, slouchy? Do the toes turn out and the heels bang upon the ground? When the patient stands bare footed how does the body weight fall in its rela tion to the center of the foot-to the inner or Is the normal range of motion restricted in any way? There should be at least 45° of plantar flexion, 15° of dorsal flexion, 15° of adduction and 10° of abduction For the last two terms inversion and eversion, supination and pronation are often used The most frequently restricted motion is adduction, and attempts at forcible adduction are painful. Frequently lateral motion may be completely restricted by pain and Limitation of dorsal due to contraction of the tendo Achillis, either from prolonged use of high heels, or from the persistence of the abducted attitude of the foot in its relation to the leg is fairly common I do not, however, believe, as is sometimes taught, that, except in rare instances, a short tendo Achillis is the primary cause of weak feet. There is usually tenderness to pressure over the head of the astragalus Examination of the pulsation in the posterior tibial and dorsalis pedis arteries should be made a part of the routine to exclude early cases of thrombo angutis obliterans, arterio sclerosis, Raynaud's disease and intermittent claudication One must remember, however, that in the case of a weak foot the muscles are always flabby, and that flabby muscles always in themselves make for poor circulation

Having made the diagnosis, what is the treat ment? There again I wish to make a point which,

if I could sufficiently impress it, would be revolutionary. The treatment of the feet begins in the head. The feet are the machine, the head is the chuffeur. The running of the feet—the way in which they are used—is of paramount importance. A poor foot properly used is better than the best used badly.

The ideal of treatment constitutes a return to the use of the foot in the attitude of activity— as an active, propulsive member, rather than as a passive pedestal. The feet should be held parallel, toes turned neither in nor out. The whole foot should be placed upon the ground lightly and softly, in contrast to banging on the heels. The feet should be placed practically one in front of the other, as if walking a tight rope. The steps should be shorter, and if necessary the knees may be slightly bent. This gait necessitates balance and balance is only attained by use of the muscles of the entire body, particularly of course those of the leg and trunk.

If the patient could be persuaded or hyp notized into the immediate and constant employ ment of such a gait, resting when his muscles became fatigued from the unaccustomed exercise, that would be all the treatment necessary. It seems simple, until we reflect that all we are asking him to do is to take conscious control of an automatic act, and instantaneously after the labits of a life time. One might equally expect to reform a drunkard by pointing out the exils of cirrhosis of the liver. Nevertheless, such treatment is the ideal, and ideals should never be lost sight of

Practically, what is usually necessary? If any imitation of motion is present the foot must be manually stretched and strapped with adhesive plaster in the adducted attitude until all such stiffness has disappeared and motion is free in all directions. Sometimes in subjects such as policemen and cooks this stiffness is so great and the pain so severe that the stretching must be done under an anaesthetic and the correction maintimed by plaster of Paris in which the patient wilks about. In the very worst cases division of the peronei tendons or lengthening of the tendo Achillis may be necessary, but I must emphrisize that such cases are exceptional

The patient must be given a proper shoe, which he must were when using the feet for working purposes. I divide the feet into two categories useful and ornamental. I explain to women patients that they must separate these categories sharply and that a working foot must be clad in a working shoe. When going to dances or dining out their foot gear may be as absurd as they please. If they insist on wearing their dancing slippers all day long they have no more right to complain of pains in their feet than they would have to complain of being cold if they went sleighing in a ball dress.

There are now so many types of good shoes that a detailed description is unnecessary. points to consider are (1) a fairly low, fairly broad heel, (2) a narrow shank so that when the shoe is laced tight the waist of the foot has a comfortable feeling of support—the same feeling of being held in that a Sam Brown belt used to give, (3) a straight inner border, so that the great toe may function properly, (4) a toe broad enough to allow all the toes to touch the ground. Never attempt to take a woman out of a 21/2 inch French heel and put her in Ground Grippers. It stretches her contracted calf muscle too sud-She will complain that she feels as if she were falling over backwards, and her agony in the calf of her leg will be heartrending. Let her down easily a half-inch at a time.

If a support is necessary we must distinguish sharply between two varieties. The first is passive support—illustrated by the innumerable forms of so-called "arches" now on the market, all designed to bolster up the arch by direct pressure from below. The second is the Whitman brace, designed by my father, Dr. Royal Whitman, whose prime object is to force the use of the foot in the correct attitude. The support afforded to the arch is of secondary importance.

A plaster cast is taken of the foot with the foot on its side, the body weight off it—in other words, with the foot held in its best possible shape. Great care must be taken to see that the foot is held so that its three weight bearing points, the heel, the head of the first metatarsal and the head of the fifth metatarsal bone are in the same horizontal plane, so that when the positive cast of the foot is made it will stand erect.

The positive mold is then trimmed, as much plaster, representing soft tissue, being cut away from the inner side of the heel and the inner side of the arch as the surgeon thinks the patient can stand. At the same time plaster is added to the outer side of the heel where it comes in contact with the ground, so as to allow for expansion when the weight is put upon the foot. The cast is then marked and sent to the brace-maker.

When the brace is applied the patient is warned that he must accustom himself to it by degrees—that the habits of a life time are not changed over night—and that any process of reform is painful. In other words, if the braces hurt him he is to take them out, put them in again the next day and wear them a little longer, and so forth. At the end of a week he is to return to the doctor's office wearing the braces whether they hurt him or not, so that on their removal the docor may see what they do to his foot and adjust them accordingly. Once they are comfortable he may wear them all day. Except in the case of policemen, fat cooks, elevator oper-

ators and motormen, small. Those whose occupations may be said to be artificially sedentary; patients should be exhorted to change their habits, so that the braces may be discarded as soon as possible. They should also be warned to discard them gradually.

The second great disability of the foot is depression of the anterior arch of the foot, anterior metatarsalgia, or Morton's toe. Except in rare cases of residual paralysis or equinus deformities from other causes this condition is almost invariably found in women, and is caused by high heels and pointed toes. The body weight is thrown forward on the ball of the foot, the toes are so cramped together that they entirely lose any active function, and actual deformity soon results. The toes are plantar flexed and displaced practically onto the dorsal surface of the foot. Callouses and corns develop over the The normal concavity of the plantar knuckles. surface of the anterior portion of the foot is replaced by a bulging convexity and rapidly becomes the seat of a painful callous. Dorsiflexion of the foot is usually limited at a right angle by contraction of the tendo Achillis, active plantar flexion of the toes is impossible, passive plantar flexion is limited and painful.

The symptoms vary from itching and burning sensations to continuous pain and discomfort. The patients say they feel as if they had a stone in their shoe. Anyone who wishes to find out how they feel has only to hold his hand in the corresponding position and bang his palm against a wall.

Morton's toe is a particular form of this condition in which the interdigital nerve, usually that between the 4th and 5th toes, is pinched between the heads of the metatarsal bones. An excruciating, cramp-like pain results, so that the woman even if at the theatre, or dining out, will kick off her shoe, seize her foot and rock to and fro literally in an agony of pain and embarrassment.

In cases in which the deformity is fixed forcible correction of the toes, sometimes necessitating division of the dorsiflexor tendons is indicated. In such cases of course an anaesthetic is necessary. The feet are then placed in plaster in the overcorrected attitude, with a bar beneath the heads of the metatarsal bones, and the toes plantar flexed over it, as nearly as possible in the attitude of a bird sitting on a perch. In these plaster bandages, covered by a leather covering or felt slipper, the patients walk about for from three to six weeks. The plaster bandages are then removed, and massage and passive stretching of the toes is started supplemented from the first by a proper support.

Here again there are two types of support. The usual commercial type of leather pad, or spring, attempts to relieve pressure on the anterior arch by taking the weight further back

on the foot. Such measures are usually effective only for a short time. To make a Whitman plate a cast is taken of the sole of the foot with the toes in as much plantar flexion as possible. The cast is then trimmed away behind the toes until the bulge of the depressed arch is replaced by a flat surface. The supporting plate is carried out as far as the base of the toes, so that every time weight is put upon the foot the heads of the metatarsal bones are forced up and the deformity thus actually corrected. From time to time the end of the plate is pounded slightly upward until at length the actual concavity of the arch is restored. It should go without saying that such support must be supplemented by passive stretching of the toes by the patient herself until the normal range of plantar flexion is restored, and by constant conscious effort on her part to grip the ground with the toes. Needless to say any treatment must be preceded by the purchase of a fairly lowheeled shoe with sufficient room in the front to allow the toes to get upon the ground.

The third most frequent of these common curses is hallux valgus-an inward deviation of the great toe toward the median line of the foot. . This results in great prominence of the metatarso-phalangeal joint, and is usually the forerunner of a bunion—which is simply a protective bursal sack that forms over the bony prominence. One must be careful not to confuse hallux valgus with the general enlargement of the margins of the joint that result from the proliferative bony changes of osteoarthritis. In such cases there may be no deviation of the toe, and the enlargement of the joint may be as evident on its dorsal as on its lateral surface.

The condition is almost always primarily due to the wearing of high heels and pointed toes. This initiates the deformity. It is then increased by the patient's habit of walking with the toes turned out, in which position the body weight falls upon the sensitive articulation with every step and with every step the great toe is pushed still further out of line. The toe entirely loses its propulsive power, and the gait becomes shuffling and inelastic. The patients' sufferings steadily increase. They spend fortunes, always vainly, upon the quest for a comfortable shoe. I say always vainly because in any shoe large enough to accommodate the painful toe the heel will be so wide that the shoe practically falls off. From discomfort and pain on walking their activity may be completely restricted. Finally, from the itching, burning sensations that keep them awake at night their lives may be literally, as they will say themselves, "ruined by these feet." Here again most commonly do we see that vicious circle-painful feet, lack of exercise, obesity, failing health, more painful feet, poor general muscle tone, progressing to total disability. When one considers seriously these mental and physical changes that so profoundly influence the patient one wonders why bunions have always been regarded as a subject for low humor.

Early cases may be relieved by proper support for the weak foot that accompanies them, by manual manipulation and by proper shoes. More severe cases call for operative treatment. In regard to operative treatment, if I may be allowed a paradox, my only positive statement would be a negative one. "Never, if you can possibly avoid it, do a Mayo operation-the removal of the head of the first metatarsal bone." This removes the most important bearing point of the foot, and shortens the toe so that it is entirely robbed of its propulsive power. The gait becomes heavy, shambling and awkward, and the patient is frequently as badly off as if his too had been amputated.

Numberless operations have been devised. The objects one wishes to accomplish are removal of the bunion, removal of the prominent portion of the head of the first metatarsal bone and correction of deformity. The particular means by which these ends are accomplished are comparatively unimportant. The proper after-care however, is of extreme importance. It consists in proper weak foot braces, building up the inner border of the sole of the shoe and systematic daily manipulation of the toe and reform of the patient's gait. Without these adjuncts the deformity will promptly recur after any type of operation.

I hope that you will all join me in lifting the three most common disabilities of the foot. have tried to explain the mechanics of their development, for if we understand the mechanism of a change its correction becomes simple. I am not an advocate of standardization, and I do not believe that many cases can ever be adapted to a given method of treatment. Nor do I believe that treatment that in one man's hands gives satisfactory results will of necessity give them in the hands of another. If we are agreed upon the broad aspects of a subject we need not bicker about details.

I was much pleased to be asked to address a meeting of physicians and surgeons upon this subject, for it seemed to me that they must be interested in it, and heaven knows that what this subject needs is interest. I hope I have convinced you that aching feet are more than the staple of the comedian's low humor-that they are a complaint of the gravest importance, and that their effect upon the general mental and physical condition may be incalculable.

I hope that I have covered in a broad way the foot out of the slough of neglect in which it has lain for centuries and join in my attempt to put its disabilities where they belong-at least on a

level with those of the hand.

There are now so many types of good shoes that a detailed description is unnecessary. points to consider are (1) a fairly low, fairly broad heel, (2) a narrow shank so that when the shoe is laced tight the waist of the foot has a comfortable feeling of support-the same feeling of being held in that a Sam Brown belt used to give, (3) a straight inner border, so that the great toe may function properly, (4) a toe broad enough to allow all the toes to touch the ground. Never attempt to take a woman out of a 21/2 inch French heel and put her in Ground Grippers. It stretches her contracted calf muscle too suddenly. She will complain that she feels as if she were falling over backwards, and her agony in the calf of her leg will be heartrending. Let her down easily a half-inch at a time.

If a support is necessary we must distinguish sharply between two varieties. The first is passive support—illustrated by the innumerable forms of so-called "arches" now on the market, all designed to bolster up the arch by direct pressure from below. The second is the Whitman brace, designed by my father, Dr. Royal Whitman, whose prime object is to force the use of the foot in the correct attitude. The support afforded to the arch is of secondary importance.

A plaster cast is taken of the foot with the foot on its side, the body weight off it—in other words, with the foot held in its best possible shape. Great care must be taken to see that the foot is held so that its three weight bearing points, the heel, the head of the first metatarsal and the head of the fifth metatarsal bone are in the same horizontal plane, so that when the positive cast of the foot is made it will stand erect.

The positive mold is then trimmed, as much plaster, representing soft tissue, being cut away from the inner side of the heel and the inner side of the arch as the surgeon thinks the patient can stand. At the same time plaster is added to the outer side of the heel where it comes in contact with the ground, so as to allow for expansion when the weight is put upon the foot. The cast is then marked and sent to the bracemaker.

When the brace is applied the patient is warned that he must accustom himself to it by degrees—that the habits of a life time are not changed over night—and that any process of reform is painful. In other words, if the braces hurt him he is to take them out, put them in again the next day and wear them a little longer, and so forth. At the end of a week he is to return to the doctor's office wearing the braces whether they hurt him or not, so that on their removal the docor may see what they do to his foot and adjust them accordingly. Once they are comfortable he may wear them all day. Except in the case of policemen, fat cooks, elevator oper-

ators and motormen, small. Those whose occupations may be said to be artificially sedentary; patients should be exhorted to change their habits, so that the braces may be discarded as soon as possible. They should also be warned to discard them gradually.

The second great disability of the foot is depression of the anterior arch of the foot. anterior metatarsalgia, or Morton's toe. Except in rare cases of residual paralysis or equinus deformities from other causes this condition is almost invariably found in women, and is caused by high heels and pointed toes. The body weight is thrown forward on the ball of the foot, the toes are so cramped together that they entirely lose any active function, and actual deformity The toes are plantar flexed and soon results. displaced practically onto the dorsal surface of the foot. Callouses and corns develop over the knuckles. The normal concavity of the plantar surface of the anterior portion of the foot is replaced by a bulging convexity and rapidly becomes the seat of a painful callous. Dorsiflexion of the foot is usually limited at a right angle by contraction of the tendo Achillis, active plantar flexion of the toes is impossible, passive plantar flexion is limited and painful.

The symptoms vary from itching and burning sensations to continuous pain and discomfort. The patients say they feel as if they had a stone in their shoe. Anyone who wishes to find out how they feel has only to hold his hand in the corresponding position and bang his palm against a wall.

Morton's toe is a particular form of this condition in which the interdigital nerve, usually that between the 4th and 5th toes, is pinched between the heads of the metatarsal bones. An excruciating, cramp-like pain results, so that the woman even if at the theatre, or dining out, will kick off her shoe, seize her foot and rock to and fro literally in an agony of pain and embarrassment.

In cases in which the deformity is fixed forcible correction of the toes, sometimes necessitating division of the dorsiflexor tendons is indicated. In such cases of course an anaesthetic is necessary. The feet are then placed in plaster in the overcorrected attitude, with a bar beneath the heads of the metatarsal bones, and the toes plantar flexed over it, as nearly as possible in the attitude of a bird sitting on a perch. In these plaster bandages, covered by a leather covering or felt slipper, the patients walk about for from three to six weeks. The plaster bandages are then removed, and massage and passive stretching of the toes is started supplemented from the first by a proper support.

Here again there are two types of support. The usual commercial type of leather pad, or spring, attempts to relieve pressure on the anterior arch by taking the weight further back

At the end of three weeks the patient was symptom free The liver decreased in size, the spleen was not palpable, ascites had not recurred Despite the fact that mixed treat ment will relieve the symptoms and arsenic may cause a toxic reaction in the liver, it was decided to give him the advantage of one course of neo arsphenamine intravenously The first dose was 0.1 gm this was gradually increased weekly to 06 gm a total of 24 gm was given. In about four months he was discharged with a final note as follows Mucous membrane pink, no jaundice present, no fluid in abdomen, liver edge beneath the costal margin-smooth and not tender-the spleen not palpable, occasional hyaline and granular casts in the urine, Van den Bergh reaction slight, delayed, and Ichterus Index

In the latest report on Tertiary Syphilis of the Liver, published by McCrae and Caven, 1926 it is stated that out of 41 cases of liver syphilis successfully diagnosed and treated, eight had a negative Wasserman Dr McCrae believes that alcohol is the chief concomitant factor in invasion of the liver by syphilis

Symmers in 1917, and LeDuc in 1929 minimized the importance of alcohol in the production of Laennecs cirrhosis and emphasized the close relationship of syphilitic to atrophic cirrhosis as based on a large series of autopsy findings in conjunction with clinical records

In conclusion, I believe that the diagnosis of syphils is warranted in this case by the following events in the course of the disease—concomitant enlargement of the spleen and liver with ascites and jaundices without as signable cause, fever and apparently complete response to antiluetic treatment

## RHEUMATIC FEVER IN CHILDREN, ITS CLINICAL ASPECTS\*

By ALBERT D KAISER, MD ROCHESTER, N Y

HEUMATIC fever has been generally This conconsidered a joint disease ception is based on its occurrence in adolescent and adult life In a child however, it is now conceded, the articular phenomena of rheumatism become a matter of secondary importance, indeed judging from clinical evidence one would say that a child may suffer severely from rheumatism who has never in its life had a pain in its joints. Some of the most severe cases of endocarditis, cases in which the rheumatic nature of the lesion has been confirmed by the presence of rheumatic nodules, have not at any time had joint pains whatever so far as can be ascertained. The term acute rheumatism though not synonomous with rheumitic fever would better describe the disease as it manifests itself in children Probably it is correct to say that acute rheumatism is a general systemic infection, comparable in many ways to the infection tuberculosis or syphillis. It is a chronic slowly progressive disease characterized by intervals of calm simulating complete recovery and periods of activity which entail further damage to the organism Up to the age of puberty the brunt of the infection usually falls upon and abides in the heart. Just before

\*Read at the Annual Meeting of the Medical Society of the State of New York at Ut to N Y June 5 1929

and at puberty, especially, in the female child, there is a special liability of the central nervous system to infection. After puberty the brunt of infection tends gradually to fall rather less upon the heart and rather more upon the synovial membrane of the joints, although the heart is still affected in more than half even of adult patients. So that in childhood, carditis occupies the center of the stage and is that upon which our gaze must be fixed throughout the whole rhematic act.

In this discussion the clinical aspects of acute rheumatic infection in children will be considered rather than the polyarthritis that typifies the usual attack of rheumatic fever. The major manifestations such as carditis, polyarthritis, and chorea cannot be definitely separated from the lesser manifestations as nodules, tonsillitis, growing pains and the skin lessons.

Acute rheumatic infection in children is by no means uncommon Including all types of acute rheumatic manifestations in children, it was found in public elementary schools in England that from ten to fifteen percent had been afflicted with this infection. A similar classification in the schools of Rochester showed the incidence to be from eight to ten percent. Acute rheumatic fever occurred in

3.5% of the English school children; while the Rochester survey revealed that 2.5% had a similar involvement. Growing or joint pains were more common, being reported in seven percent of the Rochester school children and more frequently in England. A survey made in the County of Middlesex, England, brought out the fact that twenty-five percent of the children were reported to have growing pains. Chorea occured in .5% of the school children in Rochester, and in about one percent of the English school children. Heart disease was reported in 2.6%, Rochester school children including the high school, while in the London schools it was found in 2.7% of the children.

It is well known that acute rheumatism occurs commonly in certain countries namely, Great Britian, North America and North Europe. The Chinese, Japanese and natives of India are seldom infected. The disease is less common in the southern states than the north Atlantic States. In tropical areas with abundant sunshine as the island of Porto Rico, the disease is almost unknown. This would seem to suggest that climatic conditions play some part in the frequency of the disease.

Racial susceptibility has been suggested as a factor in the incidence of rheumatism. No definite conclusions have been reached but Lucy Porter Sutton recently showed from a survey of 506 children in the cardiac clinic at Bellevue Hospital that Italian, Irish and native born Americans are somewhat more susceptible to rheumatism than certain other races.

Studies have centered about predisposing causes in this disease and a search for the etiological factor in the field of bacteriology. Surveys made in various parts of Europe and America have demonstrated that powerful predisposing factors are climate, age, social status, damp dwellings and tonsillar infections. Nutrition and diet have not yet been proved to have a definite rheumatic predisposing power. Contact with a case of rheumatism in the household is a predisposing factor but no known factor is responsible for any considerable number of infections.

In the field of bacteriology search has gone on for some years to find the causative agent. Though a streptococcus has been suspected for many years as being a causative agent, it was not until recently that Small and Birkhaug demonstrated a close relationship between a specific non-hemolytic streptococcus and rheumatic fever. It is not within the province of this paper to discuss the validity of these claims. Suffice it to say that there is a gradual acceptance on the part of the investigators of some streptococcus origin. Skin tests made with the toxin from non-hemolytic

streptococci taken from rheumatic individuals shows a preponderance of positive tests in rheumatic children. The therapeutic use of antitoxin and vaccine as developed by Small further strengthens the assumption that a particular strain or strains of a non-hemolytic streptococcus is responsible for the rheumatic infection. Additional data will be necessary before the bacteriology of this disease is settled.

One can sum up the factors relating to rheumatism by stating that there is no defi-nite evidence of heredity. There is however a definite relation of rheumatism to family incidence. Evidence has been collected to show that there are so-called rheumatic families. These rheumatic families are not necessarily among the very poor though the chances of recovery are not as good among the poor. This condition suggests the infectivity of the disease. No social conditions have been found in various investigations to be directly or indirectly associated with the incidence of this disease. Nor does any condtion in the particular child seem to predispose him to this infection with the possible exception of an unhealthy Investigations in London showed a higher incidence of so-called unhealthy throats than among the non-rheumatic children. our own investigations, though there was a uniform history of recurrent sore throats in the rheumatic children, the appearance of the throat was not different from the control groups. The relation of the tonsils, healthy or unhealthy may be a factor and will subsequently be discussed. (See Table I.)

From the standpoint of the clinician the disease must be attacked by early recognition of rheumatic manifestations. The well known picture of swollen, tender joints associated with fever must not be expected to appear in all children suffering from this disease. The major manifestations of polyarthritis. chorea and heart disease frequently occur, but it must be remembered that there are mild manifestations which have not in the past been associated with a rheumatic infection. these early mild evidences of rheumatism and what indication is there that they bear any relation to the more serious symptoms well known in this infection? For sometime it has been recognized that rheumatic carditis occurs in children in whom no history of rheumatic fever or chorea could be elicited. In these children the rheumatic manifestations either were so mild that they were overlooked or the rheumatic infection began as an endocardial involvement. In a recent survey of 105 children whose only complaint bearing on rheumatism was growing pains, 19 or 18% were found to have rheumatic endocarditis.

TABLE I
GENERAL INCIDENCE OF RHEUMATISM IN
TONSILLECTOMIZED AND CONTROL GROUPS

	20,000 Children Tonsillectomized	20,000 Children Untreated
Rheumatic Fever	399	630
Growing Pains	1267	1530
Chorea	85	75
Carditis	450	595
Scartet Fever	1524	3270

Both groups represented school children from 5 to 15 years of age. The average period since tonsillectomy was five years. The infections developed over the same period of time.

Among 260 children whose only rheumatic complaint were joint pains 49 or 19% had carditis. The incidence of rheumatic carditis among 160 children who had one or more attacks of classical rheumatic fever was 73%. It would seem that there is a type of articular involvement that causes discomfort, but which is much less severe than the acute tender swollen joint. If this involvement is strictly limited to the joint it is spoken of as joint pains. If more indefinite and involving the shaft of the bone or giving muscle pain it has been designated as growing pains. The significance of growing pains has been discredited by some authors and no pathological meaning has been

attached to the complaint. It is true that any symptom as vague as growing pains might be merely fatigue pains. However, the constant relationship that exists between children who have had growing pains and rheumatic endocarditis makes it appear more than a mere coincidence. In reviewing many histories of children who had severe rheumatic fever or chorea, it was noted that mild manifestations, such as joint and growing pains existed for The child who frequently years previous. complains of pains in the joints or indefinite muscle pains commonly described as growing pains should be looked upon as a rheumatic child. Frequent attacks of sore throats may occur in non-rheumatic children, but if these attacks are accompanied by a rapid pulse and perhaps a murmur over the precordia, a rheumatic sore throat should be considered. If indefinite pains in the extremities are associated with these sore throats one can be reasonably sure that the child has a rheumatic infection. (See Table II.)

Rheumatic infection in children may have an insidious onset. There is a type of child who may have no specific complaint except lassitude, slight elevation of the pulse rate, and pallor. These children are not unlike the pretuberculous child or one who has a peri-bronchial gland envolvement. A slight elevation of temperature frequently is associated with this syndrome. Such children usually improve with complete rest in bed but ultimately some of them develop the major manifestations of rheumatism. The recognition of the minor

More than 15 years	12	13	11	25	11
TOTAL NUMBER	159	157	123	316	123

manifestations in rheumatic children is highly desirable for the removal of any foci of infection offers greater relief then than when the major manifestations are established. Assuming that the manifestations of rheumatism both major and minor can be recognized what procedures should be followed to remove any focus of infection? The tonsils have long been incriminated as a focus for this infection. It has also been shown that infected teeth and sinus infections might be a factor in the causation of rheumatic symptoms. At least obvious infection in these locations is looked upon as possibly related to rheumatism. Infected teeth can readily be treated and with the aid of x-ray even obscure dental infections can be found and removed. Infections of the maxillary and frontal sinuses likewise can be relieved if they are found. The tonsils furnish the real problem for mere inspection of them will not decide whether or not they are harboring the exciting agent of rheumatic infection. The problem of the tonsil and its relation to rheumatic infection represents one of vital interest to the clinician. When once a specific method of therapy and prevention is established in this disease, the tonsils' importance may fade out of the picture but at present it must be considered and the decision when the tonsils should be enucleated must rest with the physician. (See Table III.)

Recent critical studies to show the value of tonsil removal to prevent recurrences of rheu-

matic fever have given more definite information on the value of the operation than the impressions clinicians held which were not based on control studies. Opinions differ on the re--sults of the operation. In some reports no control or improper controls have been used. Results are therefore inconclusive. Most reports available however agree that tonsil removal does not assure protection against repeated attacks of rheumatism. In endeavoring to . determine the value of tonsillectomy in rheumatism one cannot decide by studying only cases of rheumatism. One must determine the incidence of this infection in similar groups where tonsillectomy was performed on some and not on others before the rheumatic manifestations were evident. The controls must represent children in the same age groups and the same social The period of observation must be alike for treated and untreated children.

In a recent survey made in Rochester it was found that in a group of 20,000 tonsillectomized children between the ages of 5 and 15 years 399 children developed acute rheumaitc fever. These children had been tonsillectomized for an average period of five years. In a like group, of 20,000 untreated (tonsils not removed) for the same period 630 children developed acute rheumatic fever. From the same groups it was learned that 1,267 children of the operated group had growing pains while in the control group 1,530 had the same complaint. Chorea occurred in 85 children among

More than 15 years(16 to 17 years)	3	4	2	3
TOTAL NUMBER	35	34	21	45

## SUMMARY:

Out of 316 children who had their first attack before the tonsils were removed 80 children had one or more recurrent attacks before their tonsils were removed, 56 children had their second attack after tonsil enucleation. There is only a slight difference in the number of recurrent attacks in the two groups.

Recurrences in children who had their first attack after tonsil removal:

Out of 123 children who had their first attack after tonsil removal 31 had recurrences. Out of 159 children who had their tonsils removed after the first attack 34 had recurrences.

the operated group and in 75 children not treated. Carditis was found in 450 of the ton-sillectomized children and in 595 of the untreated children. Scarlet fever was reported in 1,524 tonsillectomized and in 3,270 untreated children. It would seem from these control studies that there is a definite lessened incidence of rheumatic infection except chorea in like age groups where the tonsils have been enucleated. One is however impressed with the fact that even in tonsillectomized children rheumatic manifestations do commonly occur.

Once some form of rheumatic manifestation has been established what benefit may be expected from tonsil enucleation. In a recent study of 439 rheumatic children it was found that recurrent attacks were only slightly influenced by tonsillectomy. There were 10% fewer recurrences among those operated after the first attack of rheumatic fever than among those unoperated after the first attack over a period of three years. The period of observation is too short for a final decision but in the age groups of 5 to 15 it would seem to offer only a slight benefit in reducing the incidence of recurrences. These results are quite in accord with a recent controlled survey made by Dr. May Wilson.

The influence of tonsillectomy in chorea has been studied. The incidence among 20,000 tonsillectomized children was .4% while among as many untreated children .5%. Removal of tonsils after the first attack seemed no guarantee against subsequent attack for recurrent attacks occurred equally in treated and untreated children. It is interesting to note however that the incidence of carditis was 62% among the children who developed chorea while the tonsils were in and 47% among those who developed chorea after tonsillectomy, one must conclude from the data that tonsil re-

moval offers very little in the control or prevention of chorea. (See Table IV.)

Based on examination of 40,000 school children in Rochester it was found that 450 children whose tonsils had been removed showed evidence of rheumatic heart disease. This represented 2.2% of the entire operated group. Among the 20,000 whose tonsils had not been enucleated the incidence of cardiac disease was 2.9%. It must be remembered that the 2.2% includes many children whose rheumatic infection antedated the tonsil operation. These were all children between 6 and 14 years of age. When however a group of children who have had rheumatic fever is studied, it is found that cardiac disease occurs as commonly in children whose first attack of rheumatism occurred after tonsillectomy as in those whose tonsils are still in. In chorea as mentioned before the incidence of carditis was somewhat less. The inference would seem justified from these studies that once a rheumatic infection is established tonsil enucleation offers no protection against cardiac involvement except in the case of chorea. The lessened incidence of carditis in children whose tonsils have been enucleated is probably due to the lessened incidence of rheumatic infection in general in children whose tonsils are removed.

The recognition of early rheumatic manifestations has been stressed What influence does tonsillectomy have in changing the frequency of sore throats, growing pains and febrile attacks, associated with sore throats? No observing clinicism has failed to recognize the association of sore throat attacks previous to rheumatic symptoms. Among 1200 children whose tonsils were removed the incidence of repeated sore thoats was reduced from 56% to 7% in a three-year-period. Among as many controls unoperated the incidence of sore throat was 52% at the beginning of the three-

TABLE IV
RELATION OF CARDITIS TO TONSILS IN RHEUMATIC MANIFESTATIONS

Lessened incidence due to less rheumatism in tonsillectomized group.

year-period and 48% at the close. It is true that only a small part of sore throat attacks are rheumatic, but with such a reduction in the incidence rheumatic sore throats would also benefit. The children's clinician has had repeated experiences where tonsil removal was practised at the first indication of minor rheumatic manifestations. No further evidence appeared for years afterwards. The problem at hand is to find a more specific test than clinical observation to know what child is infected with the rheumatic etilogical organism. A skin test dependent upon a local reaction with the toxin made from a non-methhaemoglobin forming streptococcus isolated by Birkhaug has been used extensively for this purpose. Its use brought out the fact that children with a history of rheumatic infection showed a much higher susceptibility to a positive reaction. Its reliability is not however assured as it failed to give a positive reaction in some well established rheumatic children. A reliable skin test designating either infected or susceptible children will greatly aid in selecting the early rheumatic children. At that time they should receive the benefit of tonsil enucleation rather than after the disease is well established. One might argue that a universal tonsillectomy at an early age before rheumatic symptoms usually appear would prevent more cases of rheumatism. might be the case but unless its value can be more positively demonstrated than up to the present such a universal procedure with its recognized dangers is not justifiable. An accurate skin test however might change the selection of candidates for tonsil enucleation. The problem at present is not to operate on more children but to find reliable ways of selecting those that might be called potentially rheumatic children.

312

The evidence based on these studies as well as those of other observers seem to be accumulating that tonsillectomy is not the solution of the rheumatic problem. It is hoped that specific therapy as already outlined and practised by Small may solve this problem. Tonsillectomy may then be entirely abandoned. Until such time comes its use should be encouraged in early minor manifestations of rheumatism.

#### Conclusions

1. Occurrence of rheumatic manifestations vary greatly in different countries.

- 2. There is no known outstanding social factor responsible for rheumatic manifestations. Some factors, such as housing, dampness, clothing and sanitation may play a small part in the incidence but not striking.
- 3. Rheumatism occurs in families—one or more members of a family may be affected.
- 4. The minor manifestations of rheumatism must be recognized early, recurrent tonsillitis, malaise, rapid heart, growing or joint pains, skin eruptions.
- 5. First attacks of rheumatism occurred nearly twice as often in children whose tonsils have not been removed at a given age group.
- 6. Recurrent attacks of rheumatism occurred only slightly less often in children whose tonsils were removed.
- 7. Carditis associated with rheumatic fever occurs with equal frequency whether the tonsils were in or not.
- 8. Carditis occurred less frequently in operated children 2.2% than in unoperated children 2.9%, due probably to lessened incidence of rheumatic infection in tonsillectomized children.
- 9. Tonsillectomy should be practised in children manifesting minor manifestations of rheumatism. In this group its value can be established.

#### A REPORT ON THE PROGRESS OF THE UPSTATE DIPHTHERIA PREVENTION CAMPAIGN TO DATE\*

By HERMAN F. SENFTNER, M.D., ALBANY, N. Y.
From the New York State Department of Health

THE upstate diphtheria prevention campaign begun January 1, 1926, is now in its fourth year. In this report on its progress to date, there will be considered briefly, the reasons why the campaign was inaugurated, its aim, the extent of the problem involved, the results thus far attained and what remains to be accomplished.

A study of diphtheria mortality prior to 1926 disclosed that each year many deaths were reported attended by one or more of the following circumstances: delay in calling medical aid; errors in diagnosis; delayed, insufficient or improper administration of antitoxin, and sudden deaths due to overtaxing of the heart during early convalescence. The reasonable certainty that such parental and medical errors of judgment would continue, prompted the belief that little if anything more could be done to lessen diphtheria mortality by means of methods usually employed.

Active immunization appeared to be the only method which gave reasonable promise of ultimately eradicating diphtheria. These were the chief reasons for inaugrating the

campaign.

Its aim, is to reduce upstate diplitheria morbidity and mortality, by means of toxinantitoxin immunization of all children under ten years of age, especially of those under five. Also to urge that every child be actively immunized as soon as it reaches the age of six months.

It was estimated that to reach the desired goal, it would be necessary to administer toxin-antitoxin to over one million (1,000,000) upstate children under ten years of age. This perhaps gives some idea of the magnitude of the undertaking.

While seeking to secure the immunization of all susceptible children under ten years of age, the paramount objective of the campaign is to reach and immunize the children under five. The special reasons for this are, that of the children to be inoculated, one half are under five years of age; that the greatest number of deaths from diphtheria occur in children under five; and, as will be shown further on, a marked permanent reduction in diphtheria morbidity and mortality apparently can be obtained only through a marked and continued increase in the number of actively immunized children under five years of age.

During the greater part of the first two

Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y, June 6, 1929.

years efforts were confined largely to securing the immunization of children of school age. This, as a first step, was deemed advisable since in this way the immunization of the largest number of susceptible children could be secured without delay.

At the same time, however, it seemed vitally important that some direct method of reaching children under five years be adopted since even if all children of school age were made immune to diphtheria, the death rate would be reduced by less than one-half. Therefore, while the work was in progress in the schools, efforts to reach children under five were also made by direct approach through house to house canvassing. This method more than any other has proven effective in bringing in children under five years of age.

In considering the work thus far accomplished, it is yet too early to give even approximate figures covering that done in the present year due to unavoidable delay of one or two months in sending in reports. Official reports received covering immunizations done in the first three years are practically complete and therefore give a more accurate idea of progress made. For the first three years the total immunizations reported for all ages were 442,827. These figures include only those children who have been reported to the State Department of Health as having received three doses of toxin antitoxin. They do not include figures for Rochester, reports from which city are incomplete. In round numbers there were reported in 1926-111,000 immunizations; in 1927-204,250; in 1928-127,600.

To arrive at a figure which more nearly would approximate the actual number of immunization done in the three years, there should be added to the total, the number estimated to have been done in Rochester and by physicians in their private practice. The total then probably would be close to half a million.

An analysis of the total reported immunizations for the three years shows that in each successive year there has been a slight increase in the percentage of immunizations of children under five. And it also reveals what is decidedly more significant, that in the first three years only thirteen and one-half percent (13.5%) of children under five had been immunized.

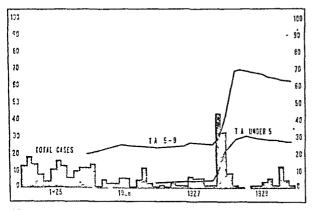

Allowing for graduation from one age group to another, it is estimated that there remains to be immunized over eight hundred thousand (800,000) children under ten years of age approximately in the ratio of three under five to two over five years of age.

It therefore requires little vision to perceive that it is vastly more important that efforts be made to immunize children under five years of age than older children. Practically all future efforts should be directed to securing the immunization of children under five, and to devising additional ways and means for accomplishing this.

The analysis further discloses that the total immunizations of children under ten years done in places of over 10,000 population were only slightly in excess of the number done in places under 10,000.

Considering the smaller extent of territory to be covered, the lesser difficulties of travel and of transportation, and the lesser expenditures of time and energy involved in reaching parents in urban districts, compared with rural, the slight recorded excess of urban over rural immunizations is disappointing.

According to reports received between January 1, 1926 and April 19, 1929 for places having a population of over 10,000, at the enumeration of 1925, only one-third reported having done immunizations of children under five, sufficient to warrant the belief, that a fair factor of safety had been established against the

Number of cases of diphtheria and percent of toxin-antitoxin immunizations according to months, by age groups: Albany, 1925-1928.

occurrence of a considerable increase or an epidemic of diphtheria in those communities.

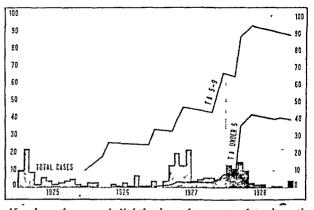

It seems, therefore, that in the more populous centers, with a few exceptions, the work either has not been properly planned or sufficiently stimulated or that a continuous follow-up has not been made after the first large scale effort. To secure the greatest possible number of immunizations of children under five the continuous follow-up is indispensable.

It is especially to be regretted that so poor a showing was made since it is known that both the diphtheria case and death rates in places of over 10,000 population have continued practically double those of places under 10,000.

## Diphtheria Rates\*

Number of cases of diphtheria and percent of toxin-antitoxin immunizations according to months, by age groups:
Niagara Falls, 1925-1928.

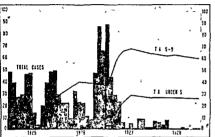

A number of types of local campaigns have been tried. That which seems to have produced the best results is the intensive drive, the preliminary stage of which is completed within not more than six weeks. The chief responsibility is vested in the local health officer. Cooperating with him is a committee made up of local representatives of the agencies affiliated with the State Health Department in the campaign, of semi-public and private organizations, of the press and of prominent lay persons interested in public health work. Sub-committees for organization, publicity, education, finance, transportation, clinics, etc., are appointed, the chairmen of which are chosen from the general committee.

The campaign is planned on a city-wide scale, the city being divided into districts but the immunization work is done simultaneously throughout the city on appointed days. Energetic efforts are made to arouse and to sustain public interest. Parents are urged to take their children to their family physician to have them immunized or to a public clinic.

Some of the cities which adopted this type of campaign with satisfactory results are Gen-

eva, Middletown, Mount Vernon, Ossining, Ogdensburgh, Port Chester, Niagara Falls and White Plains. Where the intensive type of campaign has been adopted, the number of reported immunizations under five has been gratifying. This has been especially so where subsequently there has been a consistent and continuous follow-up to secure the immunization of unimmunized children under five and of new born children at six months of age.

Another type of campaign is that tried as

Number of cases of diphtheria and percent of toxin-antitoxin immunizations according to months by age groups: Utica, 1925-1928.

an experiment by the Schenectady County Medical Society. The plan was to interest the medical profession of Schenectady in toxin-antitoxin immunization and to hold the profession responsible for the securing of the immunization of the preschool population. It was believed that the physicians would make toxin-antitoxin immunization a routine practice, thereby insuring its more permanent establishment. The belief was also entertained that the public preferred to take their children to their family physician to have them immunized and to pay him for such service and that public clinics, except for the indigent, were unnecessary.

The chief aim of the campaign was to reach children of preschool age. The city was divided into eight districts and nurses assigned to canvass each district to advise parents regarding immunization and to urge them to take their children to their family physician to be immunized. The nurses returned card reports covering visits and indicated thereon the name of the family physician. Those unable to pay after signing the card were offered two alternatives on certification of the card by the nurse-either to have their children immunized by their family physician gratis on presentation of the card or by the physician at the health centre. Publicity through the usual channels was also carried on.

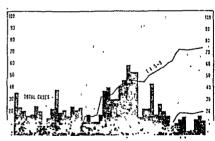

The Schenectady three year campaign terminated on January 1, 1929. In spite of earnest efforts it seems to have fallen short in certain respects. While it succeeded in securing practically twice as many immunizations of children under five as of children five to nine years, the total of immunizations is too small to insure that Schenectady as a community is sufficiently protected to prevent a considerable increase or an epidemic of diphtheria.

Whenever the nurses, for one reason or another, ceased to canvass, there followed a decline in the number of reported immunizations, indicating that the physicians of themselves apparently had not been securing any large number of immunizations.

From such data as is at hand for the first eighteen months, the cost of bringing a child to the family physician or to a clinic for immunization was two dollars, exclusive of the salary and expense costs of the nurses engaged in carrying on the canvass. This is greatly in excess of the usual cost.

The campaign seems to have failed to develop a community immunization consciousness, and to have secured the participation of unofficial organizations, in consequence of which the local health department at the end of the campaign faces the same situation which other communities faced at the beginning of 1926.

Now as to progress made in Buffalo during the first three years. In 1927 and 1928

Number of cases of diphtheria and percent of toxin-antitovin immunizations according to months by age groups: Yonkers, 1925-1928.

Buffalo's diphtheria case and death rates were twice as high as the upstate rates.

	eria

	Bu	Halo 100,000	Up: Rate per	100,000
	Case	Death	Case	Death
1927	 135	10.8	71	4.8
1928	 130	10.1	52	3.9

Although a total of forty-seven thousand (47,000) immunizations were secured up to the close of 1928, only seven percent (7%) were of children under five.

At the invitation of the Health Commissioner of Buffalo, the State Diphtheria Commitee held a meeting in that city in December last to review the situation and to suggest the best methods for securing the immunization of at least the greater portion of its child population, especially that under five years of age. The short duration intensive type of campaign was adopted and citywide immunizations begun on January 21, 1929.

During January and February, according to official reports received, over six thousand (6,000) children under five and five thousand (5,000) five to nine years of age were immunized. It should be stated, however, that the campaign was severely handicapped by an epidemic of influenza, which called for the services of the visiting nurses and caused them to cease for a time their canvass to secure toxin-antitoxin immunizations. While the number under five immunized is disappointing, the campaign nevertheless had the merit of having secured the immunization of more children under five and practically all immunizations were of children under ten. According to official reports of immunizations received the number of unimmunized children in Buffalo under five appears to be still too large to give promise of any great reduction in the near future, of its high diphtheria morbidity and mortality rates.

Unremitting efforts must therefore be made to secure their immunization and to follow-up all children under five for whom parents had requested immunization during the recent campaign but who failed to receive three doses.

A study of diphtheria morbidity in relation to the number of toxin-antitoxin immunizations under five done in any given place indicates that an epidemic of diphtheria will continue or a large increase in the number of cases is likely to occur just so long as the total of immunizations of children under five remains small. Conversely where one-fourth to one-third of the children under five have been immunized and a large number of children between the ages of five and nine have also been immunized, an epidemic stops promptly or diphtheria incidence remains quiescent.

In Johnson City, Binghamton, Geneva, Oneonta, Ogdensburg, Kingston, Glens Falls, While Plains, Port Chester, Ossining and Mamaroneck, over one-third of the child population under five and a large number of

children between five and nine years were immunized in the last three years. At the time of carrying on immunization these communities did not have an epidemic of diphtheria and diphtheria incidence in all of them either declined or remained quiescent.

The following analysis of diphtheria morbidity and of toxin-antitoxin immunizations in certain cities will further illustrate the probable involvement of this combined immunization factor.

Albany with a population under ten years of approximately eighteen thousand (18,000), had done, according to official reports received up to the close of 1926, a little over three thousand (3,000) immunizations of children under ten years of age. Of this number four hundred (400) were of children under five, that is three and one half percent (3.5%) of its population under five. In 1926 the case rate was fifty-one (51).

In the first ten months of 1927 the immunizations were increased by one thousand (1,000) but of these only two hundred seventeen (217) were of children under five, bringing its percentage of immunizations of children under five to five (5). In November an epidemic of diphtheria began in consequence of which an intensive immunization campaign was undertaken. By the end of February immunizations of children under five were brought to twenty-nine percent (29%) of its population under five and immunizations in the five to nine group to sixty-nine percent (69%) of its population in that group. The diphtheria epidemic ceased. In 1928 the case rate dropped to forty (40), that is to less than one-half of what it had been in 1927.

Yonkers having a population under ten years of age of approximately twenty-four thousand (24,000) had done, according to official reports received up to the close of 1926, over seven thousand (7,000) immunizations. Of this number four thousand (4,000) were of the five to nine group and only one hundred seventy five (175) under five; that is thirty-three percent (33%) of its five to nine population and one-half of one percent (0.5%) of its children under five.

In 1927 Yonkers immunized another forty-two hundred (4,200) of which twenty-six hundred (2,600) were of the five to nine group but only three hundred fifty (350) under five. At the close of 1927 its percentage of children under five immunized was only three and a half (3.5) and the diphtheria rate rose from two hundred fifteen (215) in 1926 to three hundred sixty-three (363) in 1927.

Early in 1928 a campaign was undertaken and by the close of the year immunizations in

the five to nine group were increased to seventy two percent (72%) of its total five to nine population and to eighteen percent (18%) of its children under five. The case rate in 1928 dropped to one hundred twenty-nine (129) a reduction of sixty four percent (64%) from that of 1927. For the same year the case rate for the State, exclusive of New York City was fifty-two (52). The relatively small percentage of immunizations of children under five done in Yonkers in the three years probably accounts for the marked difference in these rates.

Further intensive efforts should be made to largely increase the percentage of immunizations under five to avoid the likelihood of a considerable increase or possibly an epidemic of diphtheria

Utica has a population under ten of approximately twenty thousand (20,000) According to official reports received up to the close of 1926, it had reported a little over five thousand (5,000) immunizations of children under ten Of this number four thousand (4,000) were of the five to nine group and one thousand (1 000) children under five, that is thirty-eight percent (38%) of its children five to nine years of age and only nine percent (9%) of its children under five. In 1926 the diphtheria case rate was three hundred seventy four (374)

Diphtheria cases in considerable numbers continued but beginning February 1927 an intensive immunization campaign was carried on and by the end of July over six thousand (6,000) additional immunizations were done Of these twenty eight hundred (2,800) in the five to nine group and two thousand (2000) children under five These brought the immunizations in the five to nine group to sixty eight percent (68%) of the total population in that age group and to twenty-nine percent (29%) of its children under five. The diphtheria epi denue stopped promptly The case rate also dropped from three hundred seventy-four (374) in 1926 to two hundred fourteen (214) at the close of 1927 and continued to fall throughout 1928

Niagara Falls has a population under ten of thirteen thousand (13,000) According to

official reports received up to the close of 1926, it had done twenty-four hundred (2.400) immunizations under ten. Of this number twenty-three hundred (2,300) were of the five to nine age group and only one hundred (100) under five, that is thirty four percent (34%) of its total five to nine population and one percent (1%) of its total under five population Its diphtheria case rate for 1926 was forty-In 1927 twenty eight hundred five (45) (2,800) additional immunizations under ten were done Of this number twenty three hundred (2 300) were of the five to nine age group and five hundred (500) under five, that is the percentage of its total five to nine population was raised to sixty-seven (67) but that of children under five to only eight (8) The diph theria case rate rose from forty five (45) in 1926 to one hundred fifty six (156 in 1927

However, in March 1928 an intensive campaign was undertaken having for it main ob ject the immunization of children under five The net result was that by the end of May the immunizations under five had been increased to forty three percent (43%) of its population under five, and the immunizations in the five to nine age group to ninety-five percent (95%) of the population in that age Diphtheria incidence at once declined and the case rate was reduced from one hun dred fifty-six (156) in 1927 to ninety-one (91) in 1928 During the first five months of 1929 there have been only two cases reported. If this low incidence is maintained throughout the year, which is probable, the case rate for 1929 will be seven (7)

The results of the upstate campaign thus far, while not fully up to expectations, may perhaps be regarded as reasonably fair, when it is considered that this is the first attempt in this State to eradicate, on a state-wide scale, by means of active immunization a discase to which children especially are susceptible

However, further concerted and energetic action by the medical profession, the various public and semi-public organizations and the latty, in advancing the work of immunization, especially of children under five, should result in attaining the goal

## FINDING LEADERS

The history of any movement is the biography of its leader. Progress in a county medical society is dependent on leadership more than any other factor. The principal problem in the promotion of any new activity of a county medical society is that of finding a leader. Physicians are progressive in the practice of public health and civic medicine when they are represented by a leader who understands the local problem and proposes a practical plan for its solution. While a major activity of the Medical Society of the State of New York is to educate its members, yet an equally necessary activity is that its officers shall make a quiet canvass of every county society in order to discover and develop a leader in each line of activity in that county.

#### PHYSICIANS AND OTHER HEALTH AGENCIES

The science of medicine is now developed to such a degree that medical service is available for every disease, defect, and condition, to every person, young or old, rich or poor, educated or ignorant, wise or superstitious. The science is not always applied efficiently because the art of medical practice, or the application of scientific discoveries, are in the hands of doctors who are subject to the limi-

tations of other human beings. Physicians do not constitute the only group giving medical service to the people. A multitude of other agencies are also active in health work, among them being hospitals, departments of health and mental hygiene, other governmental agencies-welfare, charitable, financial-and also volunteer health agencies, such as the State Charities Aid Association and Parent-Teachers organizations. While these health agencies have a diversity of composition and object, there is a unity and continuity in the service which they give. The medical conditions which are within their scope differ in degree rather than in kind. These conditions range from advanced sickness, through illness in its incipient stage, to that which is threatened as in an epidemic or accident, and also to that which is afar off with no prospect of its immediate appearance even as a threat. Looking backward from any advanced sickness, one may usually see its strong, just as curative treatment is needed for those who are sick in bed with a fully developed disease.

337

There are always two parties in every medi-

cal transaction:

The physician who gives advice.

2. The persons who receive the advice and are expected to act upon it.

The responsibility for carrying out the treatment rests on the patient. When a disease is in an advanced or crippling stage, the patient has a strong desire to carry out the doctor's advice. But when a health impairment is in its incipiency or is merely threatened, the affected person is likely to be indifferent or even opposed to the doctor's advice. Securing the cooperation of the people and providing the means for carrying out the advice given by the doctors, are necessary parts of health work. The workers in the health field, both curative and preventive, therefore fall into two groups:

1. Doctors who give medical advice.

2. Other workers to influence the people to accept the services of the physicians.

There is nothing inherently antagonistic in these two groups, but each is the complement of the other. The peculiar fields of these two groups are indicated in the accompanying diagram.

The peculiar field of the physician is that of

SICKNES5		HEALTH	
ADVANCED	INCIPIENT	THREATENED	PROMOTED (EDUCATION)

development beginning in a series of indiscretions, through the stage of impaired health, to that of pain, weakness, and actual crippling. There was a time in nearly every case of advanced sickness, especially that of slow development, when it was merely a threat which could be averted, or was in a mild form which could be cured. Preventive medical service is needed for those who are now vigorous and diagnosing and treating actual sickness or threats of illness. The doctor is accepted as the supreme director of advanced disease; but his influence declines in the stage of incipiency, and it often fades to nothing when the disease is merely threatening. On the other hand, the volunteer health workers have little or nothing to do with advanced disease except in hospital management; but they are

almost the exclusive occupants of the field when disease is far off and health is dominant. Physicians are willing that school teachers, welfare workers, and public health nurses should occupy the field of giving health instructions to well people; but they hold that this group of workers should not diagnose or treat sickness, for they lack the knowledge and skill for doing so.

However, there are intermediate stages in which an overlapping of the fields by the physicians and the volunteer health agencies occurs. Doctors have been known to accuse public health nurses of going too far in giving medical advice to patients in the incipient stage of diseases; and on the other hand, volunteers workers have accused doctors of neglecting to give medical advice when these workers thought it was needed. But while misunderstandings are regrettable, they do not affect the broad conception of the mutual helpfulness of the two groups of workers in their relation to disease and health.

Another source of misunderstanding between the two groups of health workers is their point of outlook upon their fields of activity. The doctor faces toward sickness. He looks upon every client as a possible case of illness, and is not especially interested unless the threat to health is immediate. On the other hand workers for volunteer organizations look toward health and often exaggerate the possibility of disease prevention. They are likely to be high-pressure salesmen who offer the impossible service of making every human being immune to sickness. Doctors would qualify the statement that "sickness is a crime"

and that any one can "purchase health" as if it were a commodity to be bought.

The great work of volunteer health organizations is to educate the people regarding the kind of medical service offered by doctors. and to inform them what facilities the people should provide in order that the medical advice may be carried out. The volunteer health organizations have prepared the field for the practice of preventive medicine by physicians, and the response of the doctors has been varied. Some physicians have seen the importance of practicing preventive medicine and public health, and have assumed the leadership in arousing their medical brethren to occupy the field before other organizations exclude them. Doctors constituting a larger group are in-different, since they feel that they are now busy with all the sick patients that they can

It must be remembered that the practice of public health is a new development in medicine. It is a striking fact that when the officers of medical societies consider the various forms of medical practice and the various needs of the people, they seek the leadership in giving all forms of medical service and at the same time they develop a spirit of cooperation with all other health organizations. They recognize health service to be a unit in which they are leaders and officers; but all other health agencies are as indispensable as physicians. This was the attitude of the officers of the Medical Societies of New York, New Jersey and Pennsylvania, meeting in a conference on February eighth to discuss a modern program of health work (page 352).

## ALL HOSPITALS TO BE LICENSED

New York City has a local ordinance which requires that every hospital in the city be licensed by the Department of Hospitals. The Commissioner of Hospitals is enforcing the ordinance. New Jersey, within the last two years, enacted a law to the same point.

In up-State New York only those hospitals accepting charitable funds or caring for children and maternity cases, are licensed. The Committees on Public Relations and Public Health, in a recent conference, agreed that it would be to the public's interest to have all up-State hospitals licensed by the State. The Department of Social Welfare was consulted, and it has agreed to prepare an amendment to the law which will

extend its authority of licensure and inspection to all hospitals.

Hospitalization has become such an important adjunct to the practice of medicine that it has been widely felt that the State should make some provision for regulating the smaller hospitals that would supplement the splendid work the College of Surgeons is conducting among the larger ones.

The Committee on Public Relations urges that each County Medical Society take a critical interest in the hospitals conducted in its county. At some future time the committee may prepare a constructive suggestion as to how this may be done.

#### NASAL INFECTIONS IN BATHERS

The January twenty-seventh issue of the IVeekly Health News of the New York State Department of Health contains a page of comment on the increasing menace of infections of the noses and ears of bathers in public waters. Family physicians will be especially interested in the subject as the summer season attracts great numbers of children to the bathing beaches and swimming pools.

The danger to the nose and car has a two-fold source:

- Chemical
- 2. Bacterial

Water, either fresh or salt, irritates the noses of many persons, causing the mucous membrane to swell and occlude the Eustachian tube. This in itself is unhealthful, but it becomes dangerous when pathogenic bacteria exist in the water There is difficulty in identifying nasal bacteria in water; but wherever colon bacilli are found, those from the nose and throat will be found also. The very preventive measure,—to inhale by the mouth and exhale forcibly by both the

and enter the noses and throats of the bathers.

by the mouth and exhale forcibly by both the mouth and the nose,—blows bacteria from in-flamed sinuses and this spreads infections

Sewage in water is also a potent cause of nasal infections, even when the sewage is "Purified" in settling tanks and the effluent is chlorinated. It is common knowledge among physicians in the rural districts of Long Island that certain beaches near sewer outlets are notorious for the number of sinus and ear infections among the bathers; while other beaches a mile or two away from possible sewer pollution are free from infection.

The best preventive against infections from bathing in public waters is to avoid beaches within

a mile or two of sewer outlets.

# LOOKING BACKWARD THIS JOURNAL TWENTY-FIVE YEARS AGO

Hospitals of New York: This Journal of March, 1905, contains a letter which has a modern sound. Referring to appeals for contributions to the hospitals of New York City, the letter says:

"A fact which is not generally known by the laity is that, with three exceptions, every hospital in Manhattan and the Bronx is a "trust" by itself. No physician or surgeon not a member of its staff, no matter of what repute, is permitted to attend a patient within its walls. If a private patient is in need of hospital care the unattached medical attendant is forced to send him to one of the three small hospitals mentioned, or to an expensive sanitarium where he may retain charge of the case, or to one of the large institutions, in which event his attendance perforce ceases.

"Appointments to the staffs of these hospitals, as is well known in the profession, are secured, first, because of a "pull" with the governing board, and second, because of a private practice of such size, numerically and financially, that the appointee may directly contribute to the support of the hospital by sending patients to occupy the wards and high-priced private rooms. It is natural under the circumstances that a constant effort should be made by the physicians to keep the quota of patients at as near the capacity of the hospital as possible; yet I venture the asser-

tion that, with the possible exception of the large hospitals under Jewish and Roman Catholic management, there is not one in which there are not empty wards and empty private rooms during practically the entire year. For instance, the annual report of one hospital, recently issued, shows a large deficit during the past year, and that two ward floors containing more than a hundred beds, cannot be used until sufficient income is forthcoming to increase the service. The deficit of the Presbyterian Hospital was \$72,936, and its annual report shows that it has vacant wards for the same reason.

"Scarcely a week passes that the daily papers do not chronicle an instance in which one of the great philanthropic institutions has refused admission to a needy patient, and has transferred one to Bellevue—not because of lack of room, be it known, but because his care will increase the deficit at the end of the year! Yet the wards at Bellevue are so overcrowded that many of the 859 patients are compelled to occupy mattresses on the floors. Surely the conscience of the pub-

lic needs quickening."

The letter which is unsigned closes as follows:

"I will add that this is not the wail of a disappointed physician, as my own hospital connections are sufficiently numerous to be entirely satisfactory."

# MEDICAL PROGRESS

Latent Hyperthyroidism Masked as Angina Pectoris.—Samuel A. Levine draws attention in the New England Journal of Medicine, Nov. 21, 1929, cci, 21, to a group of patients usually treated for heart disease, in whom the underlying cause is a latent unrecognized hyperthyroidism. These cases are generally overlooked, even by most competent internists, for in them the common signs and symptoms of typical exophthalmic goiter and toxic adenoma are not evident. The diagnosis is even more difficult if there is coexisting organic heart disease. Of special interest are those cases of typical anginal attacks, in which proper treatment of the latent hyperthyroidism results in a great reduction of the number of attacks, if not complete relief from symptoms. In making the diagnosis, in the absence of typical symptoms of hyperthyroidism, attention must be paid to minor features. There are periods of unexplained diarrhea, unexplained loss of weight, nervousness, tremor, sweating, and a feeling of warmth. More hopeful features from the diagnostic point of view are transient auricular fibrillation, a snapping sound at the apex with systolic murmur, and on auscultation one gets the impression of a hyperactive hart. These signs make one suspect mitral stenosis. The only distinctive feature is the absence of any diastolic murmur in hyperthyroidism. A sign of hyperthyroidism is failure of the heart rate to respond to digitalis. The most hopeful clue, however, is offered by the general appearance of the patient. The skin tends to have a salmon hue; it is warm, moist, hyperemic, and somewhat pigmented, especially the face, neck, and upper chest. The patient's movements seem to be quick and much more alert than are commonly associated with the degree of illness that exists. There is striking grayness of the hair, and sometimes transient or mild persistent glycosuria. Most dramatic improvement results from treatment with Lugol's solution, which serves also as a therapeutic test. It should be remembered that a metabolism rate of plus 40 or more cannot be accounted for by hypertensive heart disease. Circulatory insufficiency is not a contraindication for surgery in these patients, many of whom are relieved completely, and others much improved, by subtotal thyroidectomy.

The Diagnosis and Treatment of Rheumatic Heart Disease in Its Early Stage.—Carey F. Coombs, writing in the British Medical Journal, February S. 1930, i, 3605, relates his experience with 653 cases of rheumatic heart disease in children seen at the Bristol clinic during a period of two years. No definite lack or defect, such

as avitaminosis or endocrine shortage, could be held responsible for the infection. In order that an early diagnosis may be made, every sick child should be thoroughly examined; every child with tonsilitis should be examined early, thoroughly, and repeatedly, and every child with any definite manifestation of rheumatic infection should be regarded as a possible cardiac victim. The earliest phase of cardiac rheumatism can be diagnosed with confidence if there is a coincidence of increase in the area of impulse toward the left side, accentuation of the first sound at the apex, a systolic murmur limited to, or at all events maximal at, the apex, and an accentuation of the pulmonic second sound. It is unwise to make a diagnosis on a systolic murmur alone. In the treatment of the 653 cardiac children, two-thirds have been allowed to continue attendance at school, under restriction of exercise, not because of fear of over-strain of the heart, but so the child can devote as much as possible of his energies to combating the infection. Although it is impossible to lay down definite rules as to the duration of rest in bed, prolonged rest is indicated when there is continued pallor and wasting, fever, nodes, or recurring joint pains. Any febrile event of more than four days' duration indicates a subsequent rest of not less than four months. It is always safe to give salicylates in large doses, or, in the exceptional case in which these are not well borne, aspirin, 5 to 10 grains of the former or 10 to 20 grains of the latter. These doses seldom cause toxic symptoms even if given every hour or two for more than a day at a time. Cod liver oil and iron should be given, even while the child is taking salicylates. sils are removed if they are obviously diseased, or if by reason of their size they would be removed apart from the existence of rheumatic fever, but not during acute inflammation.

Sex Hormones in the Female.—In a review of the literature on female sex hormonal factors, J. B. Collip states that Marshall and Jolly, in 1906, first demonstrated that the ovary produced a hormone which caused the phenomenon of es-In 1923, Allen and Doisy developed an accurate method of biological assay of the ovarian hormone of estrus; with this method as a guide they were able to produce very concentrated extracts. Forty-eight hours after injecting the hormone into castrated adult female rats, and into young and immature female rats, and mice, the animals are found to be in a full state of estrus. Prolonged treatment with estrin injections is said to cause enlargement of the breasts and even the secretion of milk subsequent

to the withdrawal of the treatment. Smith and Engle and Zondeck and Aschheim have shown that the phenomenon of ovulation is in a large measure controlled by the secretion of the anterior lobe of the pituitary gland. Further evidence that the pituitary gland has a profound influence on the gonad is found in the fact that hypophysectomy causes cessation of ovarian development and activity. There is also presumptive evidence of additional endocrine activity. Corpora lutea have been shown to inhibit ovulation and estrus changes in the genital tract. The development of the mammary glands from the condition in which they are found at estrus to that at the end of the luteal phase is another function of the "yellow body." Pseudo-pregnancy is apparently entirely a corpus luteum phenomenon. It has been shown that the anterior lobe of the pituitary gland may produce a second hormone which has an inhibiting effect upon the ovary. Evans found that the injection of his alkaline extract of the anterior lobe, which contains the growth principle, caused rat ovaries to become almost completely luteinized, with concomitant cessation of periods of estrus. Teel was able with this extract to prolong the gestation period from two to six days beyond the normal. Zondeck and Aschheim found that implants of placenta produced similar effects to anterior pituitary implants or injection, and further investigations have shown that the placenta is rich in estrin, a pituitary-like ovarian stimulant, and possibly a third inhibitory principle.-Canadian Medical Association Journal, February, 1930, xxii, 2.

Treatment of Hemiplegia. - Professor O. Veraguth writes at great length on the subject of hemiplegia and its treatment. He calls attention to the fact that this affection in its ordinary intravascular form is almost unknown in the lower animals, while it is very common in mankind. The reason for this disparity is unknown but probably has to do with the many forms of vascular injury in human beings which have no counterpart in the brutes. Much of the author's space is devoted to prophylaxis, including such etiological factors as lues, valvular cardiac lesions, and arteriosclerosis. Regarding actual treatment after the stroke there is not much to be said, although the greatest differences of opinion are found. This applies to venesection, for which we have no adequate theoretical basis, while empirically there is a lack of analysis of results. However, in the gravescent type the author would aspirate the extravasation of blood after cranial puncture, although he is candid enough to state that he has no clinical data to uphold this indication. The consequences of the hemorrhage require immediate attention and even a few days after the stroke he would flex and extend the limbs for

Passive motion should be continued as long as there is a trace of contracture. This of course does not mean that prevention is bound to result. Active motion is indicated as soon as contractures cease to interfere with it. The author who is associated with an institution for physical therapeutics has an elaborate manual of exercises. The muscles are not really paralyzed, he says, but are wrongly inervated from the cortex. In regard to the role of the anterior motor cells of the cord the author opposes massage of the kneading type as tending to aggravate the contractures. Gentle stroking is indicated in place of this resource. For the same reason he is opposed to the faradic current, for we should avoid rousing spinal reflex action.-Schweizerische medizinische Wochenschrift, January 4, 1930.

Treatment of Aneurysms of the Thoracic Aorta and Innominate Artery by Distal Arteriovenous Anastomosis.-After reviewing the literature on aneurysms of the thoracic aorta and the methods employed in its treatment, Patrick A. McCarthy reports 10 cases of this affection, 8 of which he operated upon by anastomosis of the common carotid artery with the internal jugular vein, a procedure devised and successfully executed by W. Wayne Babcock in 1925. The operations in this series were performed in the same manner, through a transverse incision about 10°cm. long made 5 cm. above the sterno-clavicular joint. The anastomosis must be on the distal side of the aneurysm. The ten patients were all very poor surgical risks, all had definite myocarditis, all had nephritis, and some had associated hypertension. Of the two cases not operated on, one was moribund and the other refused operation and died. All of the patients had involvement of the aorta and four showed aneurysm of the innominate artery as well. The immediate mortality was 25 per cent. Two of the patients died some time after the operation. the other four cases there was marked relief of pain and of difficulty in breathing and swallowing. The fact that 50 per cent of these patients, whose condition was regarded as hopeless, were relieved and that two of them are already back to work, points to definite value in this procedure, and with earlier diagnosis it is safe to prognosticate that the operation will prove of immense value in hitherto hopeless aortic aneurysms. Babcock's patient has lived four years since the operation and has been able to return to work. Where, on account of the location of the aneurysm, its size, or technical difficulties which beset an operation of direct attack on the carotid or subclavian arteries, this procedure should be considered. The operation of distal ligation should be relegated to oblivion, as rupture of the sac following it is to be anticipated. Wiring has been useful in certain forms of ancurysm, but whether

judgment will decide.—Annals of Surgery, February, 1930, xci, 2.

Four Cases of Dilated Aorta Successfully Treated.-William Benham Snow reports remarkable results from electrotherapeutic treatment in four cases of dilatation of the thoracic aorta. All of these patients manifested the usual symptoms of this condition, and in all of them roentgenological examination demonstrated the existence of aortic dilatation. The treatment consisted in the application of vibration for two minutes daily to the cardiovascular centers between the seventh cervical and the first dorsal vertebræ, with moderate pressure from side to side, and the static wave current over the epigastrium. This treatment accomplishes two purposes. tones up the musculature of both the aorta and the heart, and through the wave current over the epigastrium restores vigor to the sympathetic nervous system and brings the whole mechanism of the heart and large vessels of the thorax into These four patients have been normal accord. completely restored to health and are engaging in their usual activities, three of them for periods of one, two, and seven years respectively, without recurrence. In the fourth case, treated more recently, there is every reason to believe that the complete recovery resulting from the treatment will be maintained. These cases serve to illustrate the effectiveness of electrotherapeutic application to the spinal reflexes in a very large class of cases that probably are not diagnosed or at least not treated by methods that are successful.—Physical Therapeutics, February, 1930, xlviii, 2.

Yoghurt in the Local Treatment of Nasal Sinus Disease and Ozena.—Dr. B. Griessmann, a nose and throat specialist of Nuremberg, tested yoghurt locally in these ailments on the theory that the bacterial flora of the milk product is a natural antagonist of putrefaction of albuminoid substances. He makes no reference to the alleged specific bacillus which has been made responsible for the highly peculiar odor of ozena but ascribes the formation of the offensive secretions to the ordinary bacteria of putrefaction, although conceding that we know very little of the nature of ozena. Trial of yoghurt was followed by such favorable results that the author commends his method to others. The chief flora of yoghurt consist of the Bacterium bulgaricum and Streptococcus lactis in symbiosis. Both of the organisms can curdle milk and the former splits lactose into lactic acid and glucose. author procures commercial yoghurt from any milk dealer, warms it a little on a waterbath and has the patient snuff it up, and if advisable it may also be applied on cotton pledgets. A second application is made a few minutes after the first and then a third, which is left in situ from

half an hour to an hour—that is, no attempt is made to dislodge it, as in the case of the first applications. So far as possible some of the remedy should remain in the nose through the Intensive treatment will cause the odor of ozena to vanish totally. The atrophic rhinitis which is secondary to nasal sinus disease yields quickly to the same treatment. In seeking to explain these results the author does not know how much credit to give to the bacteria and how much to the formation in the nose of nascent lactic acid. He has tested ordinary sour milk and weak solutions of lactic acid as controls of yoghurt and will report in due time, but at present clings to the belief that yoghurt has special virtues in these ailments,—Klinische Wochenschrift, January 15, 1930.

Composition of Sweat and the Therapeutic Role of Sweating .- Maurice Boigey, who is the director of a thermal establishment, alludes to the great importance of perspiration in the reestablishment of health and maintenance of the equilibrium of nutrition. The composition of the fluid varies greatly with the circumstances of the patient. Thus if there is renal insufficiency the proportion of urea increases. The author has made many qualitative analyses especially in patients with gout and hepatic and renal insufficiency, collecting the fluid on pledgets of absorbent cotton placed in the axillae. Since the patients were at the time under treatment with mineral spring water and exercise the excretory function was stimulated. In 11 subjects of urinary lithiasis from 50 to 55 years of age who exercised moderately the urea of the perspiration was so abundant that crystals formed where the sweat was most profuse. These subjects all suffered from a certain amount of nitrogen retention. Blood urea before exercise ranged from 0.42 to 0.61 and exercise at first provoked a transitory increase, but in half an hour after cessation it had fallen to the rest level. In 3 diabetics with from 21 to 110 gms. of sugar per liter of urine there was an increase in the glucose of the sweat. while in 8 gouty subjects crystalline uric acid was found in the meshes of the absorbent cotton used to collect the fluid. Cystine was similarly found in cystinuric patients. The sudotoxic coefficient varies considerably with the state of the perspiration and is much higher in the sweat provoked by muscular exertion. The total solids of exercise sweat exceed considerably those of resting Hence sweating eliminates considerable toxic matter from the blood when this accumulates as a result of muscular exertion, while ordinary resting sweat is much less toxic and this is true of the sweating incidental to heat externally applied. There is sweating which merely dehydrates and sweating which detoxicates.—Bulletin de l'Académie de Médecine de Paris, December 24, 1929.

An Important Sign in Acute Appendicitis.— F. S. Sumner calls attention to a sign that is invariably present in all cases of acute appendicitis, and which is not mentioned in the textbooks. It is the state of the abdominal wall covering the right iliac fossa, and is produced by the earliest reflex of the inflamed appendix. This reflex may result in nothing more than an increase of the normal tone of the muscle covering the right iliac fossa, which is definitely appreciable to careful palpation. In searching for this sign all voluntary contraction of the abdominal muscles must be obviated. The patient lies on his back, limp, his hands by his sides, breathing freely with mouth wide open, tongue protruding, and glottis open (making no noise on respiration). warmed hand of the surgeon is then placed on the lower abdomen, the metacarpo-phalangeal joints resting on the pubes and the fingers kept rigid, together, extended, and pointing first to the right clavicle, when examining the right side and to the left clavicle when examining the left side; by a gentle movement of the metacarpo-phalangeal joints, wrist, and elbow, and without any deep pressure of the phalanges, the muscle tone of the two sides is several times compared, and, if the sign is present, there will be a definite increase of tone on the right side. It is a delicate palpation, but worth cultivating. Sumner regards it as a definite deciding factor in doubtful cases, and says it has never yet failed him. The fact that it is an objective sign and not under control of the patient makes it of the utmost value. It is important always to treat a possibly inflamed appendix very gently, and not to palpate deeply, for if the appendix is distended with pus rough handling may cause perforation. This sign, however, does not rule out chest troubles, stone in the kidney or ureter, other bowel lesions, or a twisted pedicle of an ovarian cyst .- British Medical Journal, January 18, 1930, i, 3602.

Saline Catharsis and the Elimination of Cholesterin. - Various affections presumably due to excess of cholesterin in the blood, etc., should benefit by any remedial action which can increase the elimination of this substance. K. Imhäuser of Breslau, has been doing research work along this line including the incorporation of the results of others in collateral fields. Benefit from magnesium sulphate, Carlsbad water. etc., in gallstone disease may be due in part to increased excretion of blood cholesterin. author tested the question in a presumably sound individual-himself-by confining himself to a diet poor in cholesterin, comprising sice, flour, applesauce, and a dry fat-poor buttermilk. He kept this up for 20 days and the total daily cholesterin ingested was not over 80 mgms. Toward the end of the experiment he introduced into his duodenum 200 cc. of a 15 percent solution of

magnesium sulphate daily, for several days. The blood cholesterin was determined every few days and fell from 0.282 percent to 0.187 percent. Other determinations made of the stool cholesterin showed a fall after the saline had had time to assert its full effect. In the clinical application of these tests the possibility is borne in mind that any eliminative effect of the magnesium may involve an increase of biliary secretion and accumulation; but the author believes that the greater part of the stool cholesterin does not come from the bile and that the magnesium does not increase the elimination of cholesterin through stimulation of the biliary secretion. He draws no clinical conclusions but it is evident that on a diet poor in cholesterin nothing is gained by the use of magnesium sulphate. No statement is made as to the role of this salt in the care of a promiscuous diet although it is not denied that it is of benefit in gallstone disease, whether as Carlsbad salt or duodenal infusion .- Klinische Wochenschrift, January 11, 1930.

The Effect of Abdominal Operations on the Mechanism of Respiration.-By references to the literature and personally collected statistics D. H. Patey shows that thrombosis and embolism and massive collapse and inflammatory affections of the lung bases, are more liable to be met with after abdominal operations than after surgical procedures in other parts of the body. Starting with the assumption that the reason for the special frequency of the above complications after abdominal operations is a mechanical one, he has studied the effect of such operations on the vital capacity, tidal air, movements of the diaphragm, and the respiratory variations of intra-abdominal pressure. In all the cases investigated it is shown that there must have been a certain deficiency of expansion of the lung bases, and a certain amount of venous stasis after, as compared with before, operation. In no instance did collapse of the lung or embolic complications occur; hence the conclusion must be reached that any effect that respiratory sub-efficiency has in this connection is of a subsidiary or predisposing nature only. and that other factors of an exciting nature are necessary for the development of the complications. Although it has not been demonstrated that mechanical factors are the primary cause of pulmonary collapse and embolism, it seems reasonable, since abdominal operations are known to interfere with the efficiency of respiration, to endeavor to combat such interference. The results of this study especially emphasize the importance of combating postoperative distention of the abdomen, owing to its effect on the diaphragm; the value of firm support in "splinting" the injured abdominal musculature, and the theoretical considerations in favor of employing abdominal massage after operation .- British Journal of Surgery, January, 1930, xvii, 67.

## COMPENSATION FOR AUTOMOBILE ACCIDENTS

By LLOYN PAUL STRYKER, ESQ.
Counsel, Medical Society of the State of New York

The calendars of our courts in the metropolitan district are congested to a degree that in many cases is tantamount to a denial of justice. At a recent dinner of the Brooklyn Bar Association, Mr. Justice Lazansky, the Presiding Justice of the Appellate Division, Second Department, stated that the calendars in the judicial district embracing the Counties of Kings, Queens, Richmond, Nassau and Suffolk contained some twenty-five thousand causes which were awaiting trial. Mr. Justice Lazansky made this statement in an endeavor to lay before the Bar the gravity of the situation in the Counties above mentioned.

There is now pending a bill in the Legislature for six additional judges to serve in the Counties above referred to. The condition is such that all partisan considerations should be laid aside in the interests of justice. It is to be hoped that the bill will pass. These addi-

tional judges are sadly needed.

Similar conditions exist in the Boroughs of Manhattan and Bronx where an enormous number of cases are on the calendars waiting to be tried. While it is undoubtedly true that additional judges are needed, an analysis of the cause for this calendar congestion will demonstrate that merely adding to the number of judges already on the Bench will not solve the problem of calendar congestion.

Although the figures are not before me, I think it is conservative to say that seventy-five to eighty-five per cent of the total number of jury cases on the calendars in the metropolitan district are personal injury actions, or "negligence cases" as they are commonly called. The vast majority of these cases arise from motor vehicle accidents. The result of this condition is, of course, that business men are more and more resorting to arbitration as a method of settling business disputes. Your counsel does not believe that arbitration is by any means thoroughly satisfactory as a method of settling commercial disputes, but it is obvious that business men cannot afford to wait two or three years for their cases to be reached for trial in our courts.

The problem thus stated is the subject of study by a voluntary committee known as the Committee to Study Compensation for Automobile Accidents. The funds for this work have been provided by the Rockefeller Foun-

dation, and the work is being conducted under the auspices of the Council for Research in the Social Sciences of Columbia University, with the aid of the School of Law of Yale University. This Committee will study the feasibility of providing compensation for those injured in motor vehicle accidents, along the lines of our present Workmen's Compensation Act which provides compensation for those injured in certain industrial pursuits.

The work of this Committee is the subject of a very interesting article by Arthur A. Ballantine, Esq. of the New York Bar, entitled "A Study of Compensation for Automobile Accidents," published in the February issue of the American Bar Association Journal.

On the proposition of a motor vehicle compensation plan as affording relief from court congestion, Mr. Ballantine says: "The possible desirability of a compensation plan as a means of relief from court congestion was brought out by the report in 1927 of the Special Calendar Committee appointed by the Appellate Division of the Supreme Court of New York, First Department, composed of judges and lawyers of wide experience. A committee of the New York County Lawyers' Association has favored a compensation plan, and legislation has been introduced in recent sessions of the New York Legislature looking towards its establishment."

It is recognized at the outset that many difficulties present themselves in the consideration of a compensation plan for automobile accidents. The article makes this point very clear:

"Desirable as a compensation plan may appear to be, there are obviously questions of the greatest difficulty as to whether the plan which has worked so satisfactorily in its own field is adaptable to the field of motor vehicle accidents. No one has yet formulated such a plan in detail or made an intelligent estimate of its cost or furnished a basis for determining whether the plan would meet constitutional requirements. These questions require extensive investigation and study before intelligent discussion of the merits of the plan is possible. Some of these problems may be briefly indicated.

"There is, of course, the underlying question as to whether there is an adequate juristic and social basis for extending the scope of liability without fault. Discussion of this must today turn largely on the facts relating to the need for such extension and its probable practical

operation.

"Efforts must be made, therefore, to determine the extent of the need for relief from the operation of the present system. This means trying to appraise the detailed results of the operation of the present system on persons injured, on owners and upon the public—a difficult statistical study.

"What the compensation plan would accomplish depends largely upon the actual relief it would afford. There is obvious difficulty in this instance. In the case of compensation for workmen this was comparatively easy because wages and salaries were always available as the basis of compensation. In the case of motor vehicle accidents a considerable number of the injured would be persons whose income could hardly be expected to be reflected in fixed statutory compensation. A major question is, therefore, whether a practicable basis of compensation can be worked out at all, and whether such a basis would be likely to be reasonably satisfactory to injured persons or their dependents.

"An intelligent estimate must be made as to the probable cost of the plan to automobile owners, for unless the cost can be reasonably foretold and worked out in insurance rates which are not unduly burdensome, the plan would fail at that point. Light must also be thrown on the difficult problem arising through requiring insurance of persons presenting different degrees of risk yet not readily susceptible of classification from the standpoint of risk.

"In the case of an industrial accident those concerned in it are always known and always at hand. Hit and run drivers, however, cause a considerable portion of automobile accidents, as do cars from outside of the state. Can a compensation plan take care of these difficulties?

"Can a compensation plan be effectively administered by the courts, or should it be administered by a special agency as in the case of workmen's compensation? If so, how are the constitutional requirements as to jury trials to be met? On the legal and constitutional side there are the fundamental problems as to whether injured persons can be required or induced to accept fixed statutory compensation and whether owners can be subjected to liability without fault and perhaps required to contribute to the indemnity of persons who may have been injured by others. There is also the question as to the bearing of a compensation plan upon the promotion of safety on the highways."

The article draws a most deadly parallel between the case of one injured in a motor vehicle accident, and one injured in industrial work who is entitled under the law to workmen's compensation. What a lawyer must tell a person who comes to him seeking relief in the courts from incapacity resulting from an automobile accident, is very well stated:

"'Perhaps you can recover something from the owner, possibly a large sum, but you can hardly hope to get anything through the courts for many months, perhaps not for two or more Your recovery in court will depend on many things. You must of course identify the car that struck you and its owner. You must bring a suit which probably will not be reached for trial for a considerable time. You must produce witnesses. You must prove that the accident was the fault of the driver of the car. You must be prepared to show that you were yourself entirely free from fault, for any negligence on your part will bar your recovery. You must establish in open court the exact nature of your injuries. It is impossible to say what the verdict will be, if you get one, for that depends upon how you and your case strike the jury, and how the particular jury estimates damages. When you get your verdict the defendant may appeal and it may take many months and will involve more expense to get the appeal disposed of. When your judgment becomes final you may find that the defendant is not financially responsible, and hence you may receive nothing.

"Of course, the defendant, or the company in which he may have held an insurance policy, may settle with you out of court. Such a settlement may be both fair and prompt—it is certainly the only method for securing prompt relief. In settlements, however, the defendant is in the best position, for you need relief and need it quickly, and have the burden of proving your case in every detail, while the defendant needs nothing and can take his time. You will understand that of any recovery either through court proceedings or through settlement, perhaps as much as half will be deducted for expenses and counsel fees."

Whereas, in workmen's compensation, as Mr.

Ballantine well says:

"There can be doubt that the thought of having liabilities for personal injuries caused by automobiles cared for in this way holds much attraction. What the lawyer in most states can say today to a factory or store worker injured in the course of his occupation is in very striking contrast to the advice he must give to the victim of an automobile accident. In the case of the workman, he says:

"You must notify the State Industrial Accident Board or other agency. They will look into your case at once and, unless you your-self caused the accident by wilful or gross negligence, you will have your medical bills promptly taken care of, and will receive a fixed compensation based on your wages. There need be no suit. There is little delay, merely nominal expense, and almost no uncertainty. What you will get is a limited amount but it will be prompt and sure."

This Committee is doing very important

work, and not only the Bench and Bar, but the public generally, are indebted to it for the careful study which is being given to the problem under consideration. Let us hope that some plan may be worked out which will at once aid those who have been so unfortunate as to have been injured in an automobile accident, and at the same time provide relief for our crowded court dockets.

## CLAIMED FAILURE TO TREAT OSTEOMYELITIS PROPERLY

In this case the doctor was called to treat an eight-year-old boy who upon examination was found to be suffering from the grippe. The child was seen each day for five successive days. On the third day the doctor's attention was called to an infection of the middle finger of the left hand which was due to an injury which the boy had sustained in a workshop in school. The child at all times was making satisfactory progress from his grippe condition. Hot boric applications were prescribed for the finger. Upon the occasion of the first treatment to the finger, the doctor advised the parents that the finger would require operative intervention after the pus had localized. The boric acid applications were continued for three days, at which time the doctor was advised that another physician had been called and his services were no longer required. Subsequently osteomyelitis developed in the finger and twelve days after the defendant's discharge the finger was amputated just under the knuckle.

An action was subsequently instituted in which it was charged that the injury to the finger was sustained on the day before the doctor was originally called to treat the grippe condition, but the complaint thereafter alleges that the doctor was not called until a date which agrees with the date upon which the doctor first treated the injured finger. It was claimed that as a result of improper treatment blood poison set in which required the amputation of the finger. It was ascertained that no physician was called to treat the finger for an interval of four days after the defendant's last visit.

After joinder of issue the plaintiff discontinued the action, thus terminating the action in the doctor's favor.

## CLAIMED NEGLIGENCE IN X-RAY DIAGNOSIS OF FRACTURE

In this case the plaintiff was referred to the defendant, a roentgenologist, by her family physician, for the purpose of having an X-ray taken of her arm and shoulder.

An X-ray was duly taken and a report rendered that the said X-ray did not reveal any evidence of fracture or dislocation. The patient, however, continued to suffer pain and was referred to another roentgenologist for a further examination. This second roentgenologist made additional X-ray photographs and therefrom made a diagnosis of backward dislocation of the forearm at the elbow. The family physician immediately advised the first roentgenologist of this diagnosis, whereupon

the first X-ray plates were again examined and found to sustain the first X-ray report.

It was established that between the first and second X-ray photographs an enormous effusion of blood or serum had leaked into the capsule of the elbow-joint, thus causing a spasm of triceps, thereby pulling the joint out of place.

Some time subsequent to the taking of the two sets of X-ray pictures the plaintiff commenced an action against the first roentgenologist for alleged malpractice, contending that the defendant-roentgenologist was negligent in the taking of the X-ray and in improperly reading the same. Prior to the trial, however, the plaintiff voluntarily discontinued the action, thereby terminating it in the doctor's favor without further proceedings.

# LONDON LETTER

Tuberculosis Village Settlement: The visit of Mr. Lansbury, First Commissioner of Works, to the Tuberculosis Village Settlement at Papworth near Cambridge has drawn attention to the need for providing for the subnormal man an occupation and an interest during the early period following Sanatorium treatment. The old idea that after the Sanatorium the patient should obtain a "light open air job" resulted in men finding themselves at the very bottom of the industrial ladder, and many of them had, for economic reasons, to take up their original work, with the inevitable tale of relapses. Farm work is generally too hard for these patients while a factory staffed by employés whose health renders normal working hours impossible cannot compete in the open market and it is difficult to pay the workmen a living wage. Many of these difficulties have been or are being surmounted at Papworth, where the idea is fostered that here is a community devoting itself to permanent work under hygienic conditions and skilled medical supervision. It is considered essential that the heads of departments should themselves be patients, able to understand and make allowances for a lower standard of concentration which would excite the outspoken contempt of a healthy foreman. This point was stressed in one of the earlier and most successful experiments by Dr. Jane Walker at Nayland where of a staff of 150 nurses, maids, porters, etc., over 100 were ex-patients. The financial difficulty must, of course, be faced, and, though the work done brings in a definite return, it is not enough to render the Colony self supporting. When we consider, however, the gain to that community in removing from its midst so many active tuberculous subjects, and, instead of the hopeless prospect of short recurring stays in the Sanatorium, providing permanent and interesting employment, the argument for a subsidy is overwhelming.

"What would you do if you were told you were suffering from an incurable disease which would lead to your early death?" This question might well be used as a starting point for a discussion at a debating society, and might be expected to produce some interesting suggestions. I doubt, however, whether any speaker would dare to suggest that he would write to the paper about it. But, some twelve months ago, a letter appeared in a daily paper from a correspondent who stated that at a consultation with an Eminent Physician he had been informed that he had but three months to live, and he then proceeded to

explain at some length his reactions to the dread His letter made but little impression, so callous are we to the suffering of an anonymous fellow creature; but when recently the same paper published a further letter from him saying that the sentence had not been carried out, but that "every day and in every way he was better and better", the correspondence column was flooded with letters giving details of parallel cases, and doubtless the editor's wastepaper basket was running over with similar if less happily phrased communications. Curiously enough, the reprieved one did not seem too content with his good fortune, for he was now obsessed with a constant fear of recurrence and "died a thousand deaths" in his own imagination. The problem as to whether the doctor should ever prophecy the certain death of a patient will, I suppose, never Medicine and Surgery are full of surprises, and all of us who have been long years in practice can remember instances where apparent recovery followed what we feared was an inevitably fatal condition. I have known more reputations made than unmade by a lucky prophecy-("He gave her three months and she died to the day")-but I have never dared to do it, from, I suppose, a subconscious feeling that surgery and minor prophecy are not allied professions, and require a different outlook and training. On the whole, the correspondence rather showed us up, and emphasized anew the truth of the adage of the creaking door.

Fee Splitting: A North of England newspaper has informed its readers that "dichotomy" or fee splitting has developed alarmingly in the Harley Street area, and that the London consultant is "confronted with a growing demand that he should return half the fee" to the general practioner who recommends the patient This comes as rather a shock to us consultants who thought that fee splitting was almost unknown in England. We had heard rumors of the practice from the Continent, and had even heard it whispered that it was not unknown in your fair country, a suggestion that seemed to gain confirmation from the action of the American College of Surgeons who expressly forbade it among their Fellows. My own experience is that this evil is almost unknown in England and let us hope that this is only one more newspaper "stunt" to be placed before a credulous public. II. W. CARSON, F.R.C.S.

# NEWS NOTES

## PUBLIC RELATIONS COUNTY SURVEY NO. 13-ALBANY

The Public Relations Committee of the Medical Society of the County of Albany report the following survey of public health and curative activities in the County of Albany, New York.

In the city of Albany:

5 Hospitals having 1,000 beds.

1 Hospital for incurables.

1 Certified Nurses' School and Hospital

3 Convalescent Homes.

Dispensaries for all manner of diseases.

5 Prenatal clinics.

1 Physiotherapy clinic.

The Albany Guild for public health nursing West End health centre, having a

a. Prenatal clinic.

b. Infant and pre-school clinic.

c. Dental clinic.

d. Mental clinic.

e. Tuberculosis clinic.

Three school physicians.

Twelve school nurses.

Three college physicians in the New York State College for Teachers.

Two health officers, and seven city physicians.

Two county physicians and two county hospitals.

Special mention may be made of:

Pavilion F. Albany Hospital—for mental cases.

Pavilion G. Albany Hospital—for contagious diseases.

Tuberculosis Camp, Albany Hospital.

Albany County Preventorium for delicate children.

Bender Hygiene Laboratory for any laboratory procedure.

In Albany we have The State Health Department with its laboratories:

The Red Cross Society.

The City Club work in County Health.

The cancer control society.

The Albany County Tuberculosis Society. In Cohoes, with a population of 23,000:

Tuberculosis clinic once a month.

Red Cross once a year.

Toxin antitoxin campaign, big success under Dr. Bell.

Prenatal clinic once a month—Dr. Keough. Two public health nurses.

One school nurse.

One school physician.

One baby clinic.

One venereal clinic.

Two city physicians.

Parent-Teachers Association.

One Hospital with general dispensaries.

One dispensary for eye, ear, nose and throat.

In the rural districts there are

13 health officers.

4 school nurses.

Toxin antitoxin campaigns are carried on Watervliet City, Population 16,000, which has

Tuberculosis clinic once a month.

City physicians—none.

15 physicians in city.

One health officer.

One school physician.

One school nurse.

One city nurse.

Two toxin antitoxin campaigns each year, with the physicians loyally participating and eighty to eighty-five per cent of school children inoculated.

No typhoid the past year.

Mental Hygiene.—It may be said that Albany County as a whole is probably doing as much mental hygiene work as the average county in this State, though not as much as might be expected of a county with so many advantages. But in order to meet the needs of the county at all adequately, an extension of activities in all fields covered by the survey would be necessary.

Interest in mental hygiene is everywhere apparent. The executives of many agencies visited expressed a desire to take advantage of increasing facilities, to add workers with psychiaric training to their staffs, and to do preventive work.

One of the most striking facts of the survey, however, was that present facilities, especially clinic services, are felt by many agencies to be fairly adequate. This is evidently because welfare agencies have not been educated to the point where they realize the importance of mental hygiene work. Doubtless another reason that the need for more extensive facilities has not been felt is that the local psychiatrists have been very generous about giving their services.

generous about giving their services.

While some of the "facilities" listed can hardly be considered mental hygiene activities, it is thought that even the simplest beginnings may serve as a foundation for building up a program.

In a district like Albany County it is undoubtedly better to build up a well-rounded program from existing resources than to wait for the perhaps non-existent time when ready-made facilities from outside may be introduced.

There are six physicians at four clinics engaged in this work of mental hygiene. There are nine societies doing welfare work.

- a. American Red Cross.
- b. Board of Child Welfare.
- c. Catholic Charities.
- d. Church Mission Help, Inc. e. County Department of Charities.

- f. Mohawk and Hudson Humane Society.
- g. Family Welfare Society.
- h. Jewish Social Service Committee
- i. Trinity Institution.

T. W. Jenkins,
Frances E. Vosburgh,
C. K. Winne, Jr.,
L. S. Poskanzer,
M. J. Keough,
Committee.

### LEGISLATION

#### LEGISLATIVE BULLETIN NO. 4

Senate Int. No. 17, Fearon—Allowance to incapacitated mother, has passed the Senate.

Senate Int. No. 46, Patric—Assembly Int. No. 81, Sheldon—Lewis County hospital bonds, has passed the Senate and reached third reading in the assembly.

Senate Int. No. 351, Hofstadter—Assembly Int. No. 468, Moffat—creates a commission to study the question of compensation for persons injured by automobiles, and appropriates \$40,000.00.

Senate Int. No. 396, Pitcher—Assembly Int. No. 464—Lattin, amends the Public Health Law with regard to the manner of administering State aid to counties for public health work.

Senate Int. No. 397, Pitcher—Assembly Int. No. 466—Lattin, is another bill prepared by the Department of Health relative to vital statistics and the revision of birth and death certificates.

Senate Int. No. 398, Pitcher—Assembly Int. No. 465—Lattin, amends the Public Health Law by increasing the authority of local health boards. Senate Int. No. 399, Pitcher—Assembly Int. No. 463, Lattin, amends the Domestic Relations Law by providing that affidavits, statements and consents given for marriage licenses shall be open to inspection for legitimate purpose, instead of to public inspection, and relative to reporting marriage records to State health department.

Senate Int. No. 431, Brown—Assembly Int. No. 120, Dominick—Mr. Brown has introduced in the Senate Mr. Dominick's sterilization bill.

Senate Int. No. 438, Wicks—Assembly Int. No. 567, Davis—Would revise the Public Welfare Law relative to tubercular poor residing in any town in Ulster County. Most of the counties in the Adirondack and Catskill mountainous areas have laws protecting themselves against invasion from other sections of the State by indigents suffering with tuberculosis. Ulster County is asking for similar protection.

Senate Int. No. 456. Hickey—Assembly Int. No. 608, Marcy—Creates a temporary commission to acquire a site for a new institution for the care, training and custody of mental defectives.

Senate Int. No. 531—Mr. Campbell has reintroduced one of the pharmacy bills of last year, which provides among other things that a druggist may dispense drugs, etc., during the temporary absence of pharmacist in New York City stores, as elsewhere in the State.

Senate Int. No. 532, Fearon—Amends the Public Welfare Law by permitting a town board to appoint an assistant town public welfare offi-

cer and other necessary employees.
Senate Int. No. 533, Shackno—Assembly Int. No. 722, Post—creates a commission to study the subject of maternity aid, and appropriates \$10,-000.00.

Senate Int. No. 547, Pitcher—Assembly Int. No. 646, Lattin, amends the Public Health Law so that the State Health Commissioner can have better control over carriers of disease when no hospital nor institution is available.

Senate Int. No. 549, Pitcher—Assembly Int. No. 647, Lattin—A bill introduced by the Department of Health amending the law so that boards of supervisors may refund public health nurses for expenses incurred in their course of duty.

Senate Int. No. 553, Hastings—Amends the Education Law to create in the Department of Education a division of medicinal liquor.

Senate Int. No. 587, Hickey—Assembly Int. No. 506, Hanley—Amending the Education Law by permitting optometrists to assume the tittle of "Doctor." This is the bill that Assemblyman Berg has sponsored in preceding years.

Senate Int. No. 608, Sheridan—Assembly Int. No. 792, Post—Creates in the State Health Department a division of control for aiding in the enforcement of prohibition, Art. 18, Constitution, and for protection of public health, and appropriating \$500,000.00.

Senate Int. No. 625, Mr. Brown-Introduces

a new chiropractic bill.

Assembly Int. No. 470, F. L. Porter—Amends the Public Welfare Law by providing cost of maintenance and care of children admitted to the New York State Reconstruction Home shall be determined by the State Department of social welfare, which shall fix a charge of not more

than one-half actual cost, to be borne by county

in which patient lives.

Assembly Int. No. 494, Doyle—Amends the Public Health Law, requiring those procuring donors of blood for transfusion to be licensed by local health officer.

Assembly Int. No. 573, Horn-Amends the

Workmen's Compensation Law relative to allowance of claims for medical and surgical treatment, by removing the time limit for notification.

Assembly Int. No. 738, Gimbrone—Amends the Workmen's Compensation Law by permitting injured employee to provide for his own treatment and care at expense of employer.

## LEGISLATIVE BULLETIN NO. 5

February 13, 1930.

Assembly Int. No. 159, Esmond—Mental Hygiene Law, establishing a board of psychiatric examiners for certification of qualified psychiatrists, has gone to third reading.

Assembly Int. No. 424, Cornaire—Workmen's Compensation Law, occupational diseases, has gone to third reading.

Senate Int. No. 587, Hickey—Education Law, optometrists' title, is reported out of committee.

Senate Int. No. 636, Lord—Assembly Int. No. 829, Whitcomb, amends the Public Welfare Law by providing towns with population of 10,000 or more in certain counties, shall have the responsibilities of a city in a county public welfare district and authority to maintain a town home.

Senate Int. No. 643, Kirkland—Assembly Int. No. 846, F. M. Smith—Excepts the licensing of dogs which are confined for purposes of research.

Senate Int. No. 700, Pitcher—Assembly Int. No. 894, Lattin—Amends the Public Health Law relative to county health districts, permitting the health officer to be called "Commissioner" and giving the county auditor authority to audit the expenses of the health district, and making provision for payment where there is no auditor. This bill will be sent to the chairmen as soon as it is printed.

Senate Int. No. 727, Knight—Assembly Int. No. 955, Stockweather—gives boards of supervisors authority to employ dental hygienists and clinic physicians. This bill will also be sent out within a day or two.

Assembly Int. No. 666, Foody—Provides that the hospital expenses incurred during the last illness of a deceased shall be among the first bills paid. We hope to have this amended so as to include nurses and physicians.

Assembly Int. No. 831, Coughlin—amends the Workmen's Compensation Law to permit the injured employee to recover reasonable amounts expended for medical or other attendance.

Assembly Int. No. 836, Cuvillier—provides for purchase and storage by State health commissioner of wines and malt beverages, for their sale to persons and corporations licensed therefor, and appropriating \$500,000.00.

Assembly Int. No. 854, Doyle—Is another radio bill, requiring approval by State health

commissioner of all statements broadcast concerning patent medicines, devices and remedies,

There is enclosed a copy of the "White book," and let us say again that the busy portion of the legislative season is beginning and you should by all means keep in touch with your legislators. licensed physicians being excepted.

Assembly Int. No. 855, Doyle—Is the cosmetic bill of last year, requiring that cosmetics be labeled, stating that formula does not contain arsenic, lead salts and other specified ingredients over a certain percentage.

Assembly Int. No. 871, Cuvillier,—Authorizing the State health commissioner to establish in each county one or more cancer clinics. This bill Mr. Cuvillier also introduced last year.

Assembly Int. No. 908, Streit—Establishes a State camp advisory board. Mr. Streit is doing this at the request of the editor of "Camp Life," who is engaged in developing a national interest in the conduct of camps, particularly from the health point of view. New York State is one of the most popular States for camping and the State Department of Health has endeavored in recent years to have them inspected by the bureau of sanitation and the local health officers. Mr. Streit aims principally to show the importance of this work so that the Department of Health might increase its staff.

Assembly Int. No. 938—Mr. Dominick has reintroduced his bill of last year for the creation of five infirmary districts, the object being to establish in each of these districts an infirmary to take charge of the hospital cases developing in the county homes. Frequently, in county homes, the number of infirmary cases is too few to warrant the expense of properly conducting an infirmary. He argues that his bill will result in a saving, especially to smaller counties.

Hearings

Feb 18.—Sen. Int. No. 187, Baumes (Assembly Int. No. 303, Esmond), establishment of psychiatric clinic in connection with probation Dept., general sessions court, New York County—2:00 P.M., before joint Committee on Codes.

Feb. 18.—Assembly Int. No. 157, Vaughan—Anti-vivisection bill; 2:00 P.M. before Assembly Committee on Codes.

#### LEGISLATIVE BULLETIN NO. 6

Senate Int. No. 587, Hickey—Optometrists seeking use of the title "Doctor," was advanced in the Senate to third reading. The Assembly bill-Int. No. 506-has not moved, and we hope to be able to keep it from moving. We have persuaded Senator Hickey not to advance his bill any further at present. Won't each chairman look up this bill and write Mr. Hickey immediately your objection to it?

Senate Int. No. 727, Knight-Assembly Int. No. 995, Stockweather-Which gives boards of supervisors authority to employ dental hygienists and clinic physicians, has been reported out in the Assembly and has reached third reading in the Senate. This bill will give boards of supervisors in the smaller counties where there is no county health unit, authority to pay physicians for services rendered in child welfare clinics, antidiphtheria clinics, etc. We think it a good bill and are urging its enactment.

Assembly Int. No. 212, Bernhardt-Amending the Public Welfare Law, permitting pregnant women in institutions to have their children outside the institution, has been reported out of

committee.

Assembly Int. No. 390, Eberhard-This is the optometry bill of several preceding years which would permit school boards to employ optometrists to make tests of children's eyes. have always opposed this bill, although we have never had probably as much support from the Department of Education-to whose law it is an amendment-as we had wished; and the same is true again this year. The bill has been reported out of the Education Committee in the Assembly. A copy of it will be sent to the chairman in a day or two.

Assembly Int. No. 400, Rice-The bill that makes it possible to take a four-year course of medicine in three years, has advanced to third

reading.

Assembly Int. No. 465, Lattin-Amending the

Sanitary Code, has been reported out.

Assembly Int. No. 466, Lattin-Amending the vital statistics section of the Public Health Law so as to provide for new birth and death certificates, has been reported out.

Assembly Int. No. 646, Lattin, providing that the State may assist in the payment of allowance to disease carriers, has been reported out.

Assembly Int. No. 647, Lattin-Amending the County Law so as to permit nurses to be paid their expenses at intervals between the times of the meetings of boards of supervisors, has been reported out.

#### Bills Introduced

Senate Int. No. 849, Mastick-Assembly Int. No. 1088, Bernhardt-One of the old-age bills submitted by the commission appointed by the legislature last year to make a study of the sub-

Senate Int. No. 850, Mastick-Assembly Int. No. 1087, Bernhardt-Provides an appropriation of \$100,000.00 for the operation of the old-age

Senate Int. No. 851, Mastick-Assembly Int. No. 1086. Bernhardt-Extending provision relating to out-door relief to all sections of the This embraces New York City, which was not included in the Public Welfare Law.

Senate Int. No. 852, Mastick-Assembly Int. No. 1064. Bernhardt-Relative to the procedure for closing a county, city or town home on order

of board of charities.

Senate Int. No. 878, Love-Creates a commission of seven, one to be a veterinarian, one a physician, and one a dairy farmer, to investigate tuberculin tests among cattle.

Senate Int. No. 893, Cheney-Assembly Int. No. 1159, Piper-Amends the Public Health Law by giving a registrar of vital statistics a fee of 50c for each birth or death certificate filed.

Senate Int. No. 896, Lord-Assembly Int. No. 1169. Whitcomb-Amends the Education Law by exempting the sale as merchandise in established place of business of spectacles fitted with frame

and spherical lenses.

Senate Int. No. 913, Fearon-Amends the Education Law by repealing the law enacted last year relative to master dental technicians. have an interest in this bill because we opposed the enactment of last year's bill on the ground that technicians were too limited in education to distinguish them as a particular class, and that bill provided that they should not only be licensed and set aside as having a particular degree of education, but also provided for an examining board to be composed of master technicians. We characterized the whole thing as similar to the efforts that were made by cultists, drugless therapists, et al to modify the medical practice act, and the dentists have since discovered that we were right in that and they are now endeavoring to have the law repealed.

Assembly Int. No. 960, Byrnes-Amends the Criminal Code by permitting a court to appoint two physicians on a board of referees to conduct examination into mental condition of defendant

in a criminal case.

Assembly Int. No. 972, F. L. Porter-Mr. Porter has introduced in the Assembly the chiropractic bill reported in a previous bulletin introduced in the Senate by Senator Brown; (Int. No. 625).

Assembly Int. No. 1053, C. P. Miller--Provides for the creation in the Department of Labor of a medical advisory council. Our bill of last year. Write Mr. Miller your approval.
Assembly Int. No. 1130, Lefkowitz-Making

it a misdemeanor for any person except a licensed physician or physiotherapist to sell therapeutical medicines, instruments or appliances. We have informed Mr. Lefkowitz that there is no need of making exception to physiotherapists in his bill, because they have no legal right to prescribe. Otherwise we have told him that his bill is good and we shall do what we can for its advancement.

### Comments

The chairman of the Committee on Labor and Industries in the Assembly advises us that Assemblyman Gimbrone's bill permitting free choice of physician by injured employee, should be amended by adding a "saver clause" so as to prevent violent abuse of the measure. We have taken the matter up with Assemblyman Gimbrone and he has it under consideration. We have grave doubts as to whether the bill can be advanced without the "saver clause," and we hope that the Assemblyman will agree with us.

Harry Aranow, Walter A. Calihan, John J. Rainey,

Committee on Legislation, Medical Society of the State of New York.

## TRI-STATE CONFERENCE

The fourteenth conference of the officers of the Medical Societies of the States of New York, New Jersey and Pennsylvania was held on Saturday, February 8th, 1930, in the Hotel Pennsylvania, New York City, with Dr. William H. Ross, President-Elect of the Medical Society of the State of New York presiding, owing to the sickness of Dr. James N. VanderVeer, President. There were present:

From New York, Dr. W. H. Ross, President-Elect; Dr. D. S. Dougherty, Secretary, Mr. J. S. Lawrence, Executive Officer, Dr. Frank Overton, Executive Editor, and Dr. George M. Fisher, Past-President.

From Pennsylvania, Dr. William T. Sharpless, President; Dr. Walter F. Donaldson, Secretary, Dr. Frank C. Hammond, Editor, and Dr. Arthur C. Morgan, Past President.

From New Jersey, Dr. Andrew F. McBride, President; Dr. J. B. Morrison, Secretary, Dr. George N. J. Sommer, First Vice-President, Dr. John F. Hagerty, Second Vice-President, and Dr. Henry O. Reik, Executive Secretary and Editor.

The meeting opened at 10:30 A. M. and continued through a noon luncheon and until 3:30 o'clock.

The subject of the Conference was the question, "How can the Medical Profession, through its units, most effectively cooperate in promoting the Modern Lay Public Health Program?" The question as discussed by the speakers might be more concisely stated as follows: "What should be the relation of the Medical Society to other agencies that are carrying on public health work in the county, such as Tuberculosis Associations and Parent-Teachers Associations; and toward public health movements, such as Anti-Diphtheria campaigns and the Medical Education of the public?"

There was a unanimous agreement among those present on two points:

1. Lay health organizations are necessary in every county.

2. County medical societies should take an active interest in all lines of public health work.

The plan of the program of the conference was that each president should write a paper on the subject and send a copy to each of the other members of the conference in order that all the conferees might come prepared. In accordance with this plan, papers were written by the three presidents, and by Drs. Ross and Hammond. Nearly all the other members made contributions drawn from their own knowledge and experience.

In closing the meeting, the Chairman expressed the wish that some one would sum up the vital points of the discussion in a statement of five hundred words. The publication of such a summary has been the policy of the New York State Journal of Medicine since the conferences were organized in 1925. Making a summary of the present conference is comparatively easy, because of the plan of a written preparation by each leading speaker.

The conference may be considered as a consultation of State Society officers over the condition of a patient,—the county medical society,—in its relation to other organizations working in the field of public health. Before the consultants came to the conference, each one had taken the history and made an examination of the patient. The consultants were therefore prepared to go directly to the next step,—that of diagnosis. They were unanimously agreed on the following diagnoses:

1. The primary and chief complaint was egocentrism, or self-satisfaction with conditions as they are.

2. The secondary and complicating condition was *malaphobia*, or fear of misfortune following a change in the method of medical practice.

In support of the primary diagnosis, the following opinions may be quoted: Dr. VanderVeer: "The medical profession has seemed to grasp the changes (in medical prac-

tice) more slowly than the public."

"In our county societies we find two opposed groups,—those who scoff at preventive or public health medicine, and those who are pioneering in it."

"We have lost our guidance and direction of their (lay organizations) efforts mainly through our own fault in being lazy in the past years."

Dr. Ross: "It is not unusual to find a county medical society that has not an understanding of

what a modern health program is."

"Some county medical societies, seeing only the mistakes of lay health organizations, have lost sight of the great good that these organizations have done."

"It is depressing to hear any society declare that public health work is already being done as

well as it can be."

"Let the profession define its policy toward modern public health service,—is it aloofness and opposition, or is it active cooperation with all other health forces?"

Dr. Sharpless: "Too frequently it (the medical profession) has very little interest in the general

question of disease prevention."

"It is humiliating to have to record that medical societies, as well as individual physicians in many places, have stubbornly resisted the earnest efforts of State and other health societies; and these organizations were obliged to go to lay organizations for assistance."

Dr. McBride: "Every organization that has voluntarily entered into public health work has at first met with the cold shoulder of the medical

profession."

Dr. Hammond: "The public is being educated to the problems (of public health) ahead of the

doctor.

"Many physicians have been practising curative medicine, having little knowledge of preventive medicine. Hence either the health department or a voluntary agency takes the initiative in the program of the prevention of disease."

Dr. Sommer: "The profession always seems to have a hundred reasons why a thing cannot be done, and no reason why it can be done."

"Another unfortunate thing in relation to these public health programs is our individualistic attitude. Every physician is interested in his own special problem, and does not care sufficiently about the problems of others."

Dr. Morgan: "Medicine was formerly taught entirely from the curative standpoint. There should be an attempt made by the organized medical profession to enlist teachers in the medical schools along the practical application of preventive medicine in presenting the subject to their students."

The following opinions support the diagnosis

of the secondary condition, and also the answer to the fear of loss of practice:

Dr. VanderVeer: "If the prevention of a disease and its eradication can be absolutely predicated, then it is the duty of the medical man to accept the scientific facts, and prepare himself to gain the same or a better livelihood in newer lines of similar work."

Dr. Ross: "Preventive medicine is opening the door of opportunity for the medical profession to engage in a form of practice which shall more than make up for the loss of practice of the curative form."

tive form.'

Dr. Hammond: "Fees that have been missed by the physician as a result of public health activities in the main arc his own fault, because he has not been willing to do the duties necessitated by public health measures."

The consultants also discussed the treatment of the conditions found in the County Medical Societies. The manner in which the therapeutics were applied in the different States was described

as follows:

Dr. McBride: "In New Jersey we have been making an extra effort to inculcate a definite policy of cooperation to our associations, within and outside of the profession."

Dr. McBride then enumerated a long list of agencies, both official and voluntary, with all of which the officers of the State Medical Society

keep on intimate terms, and said:

"It has become the established custom with us for the president, the secretary, and the executive secretary to attend at least one meeting per annum of each of the twenty-one county medical societies. We not only give them the news of the State and National societies, but we inquire about local conditions and assist any society that is in need of advice or help."

Drs. McBride and Morrison both referred to the work of Mrs. Taneyhill, field secretary in popular health education, in lecturing to school children throughout the State with the approval

of the State Department of Education.

Dr. Morrison told of a number of other public health activities carried on by the State Medical Society of New Jersey, among them being the following:

- (a) Cooperation with State Boards and other official agencies, such as the Departments of Health and of Education, the Department of Institutions and Agencies (which is like the Department of Welfare of New York State and the Board of Medical examiners.)
- (b) Securing the appointment of five physicians on the Public Health Council of the City of Newark.
- (c) Promoting a successful anti-diphtheria campaign throughout New Jersey.

(1-11

(d) Arranging that one entire session of the annual State meeting shall be given over to the several departments and boards of the State.

Dr. Sommer told of his experience in getting the staff of a Trenton Hospital to develop a plan to submit themselves to a physical examination in order to inspire the doctors to make the examinations of their patients.

Dr. Morgan described his efforts to have public health taught in medical schools with far greater emphasis than is now given to the subject.

Dr. Fisher described the activities of the organization of the doctors of the City of Utica in consulting with lay organizations in regard to the new tuberculosis sanatorium, and in the promotion of an anti-diphtheria campaign.

Dr. Donaldson described the anti-diphtheria campaign that was conducted in the City of Pittsburgh through the cooperation of physicians with lay health agencies.

Dr. Ross described the peculiar work of the Committee on Public Relations of New York State, and said:

"Physicians can best cooperate in public health through the county medical society. The work will begin by a few leaders whose leaven will influence man after man until it inspires the whole membership. The first step of the society will be the organization of a real Public Relations Committee, which shall survey the field and ascertain what public health work is now being done in each county and the organizations engaged in it. Twelve counties are now well organized, and have made surveys of their counties which have been published in the State Journal."

Dr. Sharpless, speaking of the cooperation of health agencies, said:

"All health organizations in a county should be brought together, or at least correlated under an administrative head, including social service and visiting nurse societies, neuro-psychopathic clinics, antenatal and postnatal clinics, well-baby consultations, child welfare and child guidance clinics, anti-tuberculosis and mental hygiene clinics, and recreational activities. The relation of the county medical society to this unified body should be advisory in character, and

the society should map out and supervise the work of the whole."

Dr. Sharpless then made an outstanding contribution to the conference as he described the organization of the Health and Welfare Society of the County of Chester,—his home county,—which has 120,000 inhabitants. The Pennsylvania law of 1925 authorized county officials to appropriate money for public health purposes, and under it the county appropriated \$4,000 annually. This money is combined with that of voluntary health organizations in the county, and with it a physician is hired to do the work of a county health officer, although he has no official standing. The county medical society will be the leader in the administration of the funds, and will furnish the medical inspiration and advice.

Other counties are planning to follow the example of Chester.

Dr. Sharpless also said that the State Society of Pennsylvania tries to have each county society devote one meeting to tuberculosis, one to cancer, and one to mental hygiene.

Many other subjects were discussed in an incidental, theoretical way, among them being the following:

1. Educating and inspiring physicians.

2. Securing pioneer leaders in public health.

3. Employing paid workers by county societies.4. Popular medical publicity and education by

radio, lectures, and newspaper articles.

5. Graduate courses.

6. Censorship of medical advertisements in daily papers and magazines.

7. Need of reaching individual members.

8. Sponsoring clinics and demonstrations by county societies.

9. The Woman's Auxiliary.

10. Payment for public health practice.

It was the consensus of opinion of the consultants that the trouble with county medical societies and their members was not sickness, but simply a lack of development. All were further agreed that development of the practice of preventive medicine, public health, and civic medicine has been rapid in those counties in which a few pioneer leaders have shown what methods are practical.

## LEGISLATION ON SPECIALISTS IN NEW JERSEY

A bill was introduced in the Assembly of the Legislature of New Jersey on February 3, entitled "An Act to regulate the practice of surgery and the specialties pertaining thereto, to license specialists, and to punish persons violating the provisions thereof." The bill covers eighteen printed pages, and at its end the following statement appears, and is here re-

produced verbatim, with its obscurities and uncertain grammar:—

"The purpose of this act is to protect the public from incompetent, inexperienced, and self styled specialists; to prevent overcharging of patients, and the needless operations by incompetent specialists who have had insufficient professional preparation. The fatal

disasters that have resulted from the hands of the tyro is causing the public to become restive as the result of the number of deaths and otherwise bad results occuring from operations that should, under proper conditions be without danger. That had brought discredit on the medical profession as a whole. And to provide ways and means to regulate the practice of surgery and surgical specialists, to license specialists, punish violators without interfering with the work of the legitimate and ethical practitioner."

Thirteen specialties are included in the bill.—surgery, gynecology, obstetries, urology, ophthalmology, othology, laryngology, rhinology, orthopedic surgery, proctology, roentgenology, pathology and anesthesia.

The bill sets up an examining board of fifteen members consisting of four surgeons, two gynecologists, two urologists, and one representative from each of the other specialties except that of proctology, while one person will represent both the opthalmologists and the otologists.

Candidates for examination and license must be graduates in medicine and licensed to practice in New Jersey, and in addition must have had experience as residents in a recognized hospital having at least sixty beds for periods ranging from four years in surgery, to one in anesthesia.

Provision is also made for the limited registration of internes, entitling them to practice the specialties as assistants to those fully licensed.

Those who pass the examinations are entitled to special degrees, consisting of a capital M., followed by a letter representing the specialty, as M.S. for a surgeon, and M.G. for a gynecologist, although the meaning of the M is not explained. It is interesting to find that the degree "M. Oalo" is assigned to anyone who is a specialist on the eye, ear, nose and throat.

The bill is exceedingly crude and obscure, and ungrammatical, and no information as to its origin is to be obtained. It is noticed in this Journal simply because it is the first of its kind to come to the attention of the editors.

#### BROOME COUNTY

The Broome County Medical Society met at the Hotel Arlington, Binghamton, Tuesday evening, February 4. New members were admitted to the Society and other applications received.

Dr. Joseph Lawrence of the State Health Department spoke on the Importance of the Immunization of Children of Pre-School Age against Diptheria with Toxin Antitoxin. Dr. John A. Conway, District State Health officer, also spoke on the same subject and showed the great benefit to be derived by this early immunization and urged that the parents be given every encouragement in bringing this about.

A committee was appointed on Public Health Education and Public Relations to aid in this matter and other matters of interest to the Public. Dr. Chalmer Longstreet was appointed Chairman of this committee.

Dr. Donald Guthrie of Sayre, Pa., gave a most able address upon the Surgical Treatment of Intestinal Obstructions. The paper was discussed by Doctors F. M. Dyer, W. H. Hobbs, and A. S. Chittenden. Many of the members followed actively in the general discussion.

H. D. WATSON, Secretary.

#### SCHUYLER COUNTY

A meeting of the Schuyler County Medical Society was held on May 21, 1929, at the house of Dr. Oakley A. Allen, President, who occupied the chair. There were present Doctors Allen, Bond, Burton, Ferris, Jackson, Holmes, King, Quirk and Stewart.,

A report on the finances was made by Dr. Quirk, who also reported on the last District

Branch Meeting which he attended.

Dr. Holmes stated the desire of the Roentgenologists of the State for the creation of an x-ray section of the State Society and asked that the delegates to be chosen from Schuyler County advocate the creation of such a section, at the next meeting of the State Society in June.

Dr. Ferris read the scientific paper of the meet-

ing, which was entitled "Aftercare Of Influenza Cases." Discussion followed in which several members took part.

The following officers were elected to serve for the ensuing fiscal year:—President, Dr. John W. Burton of Mecklenburg; Treasurer, Dr. John M. Quirk, of Watkins Glen; Secretary, Dr. Frederick M. Bond, of Burdett.

Election of a delegate to the State Society annual meeting, resulted in the choice of Dr. Ferris, with Dr. Holmes as alternate.

After discussion of a recent coroner's case by Coroner Allen and others, the Society adjourned to dine with Dr. and Mrs. Allen.

A. W. FERRIS.

## TOMPKINS COUNTY

The question of establishing a County Health Department was considered by the Tompkins County Medical Society three years ago and the project was promoted by lay organizations engaged in public health work. Dr. W. H. Ross, President-elect of the Medical Society of the State of New York, addressed a special meeting of the Society on February 4, and presented arguments in favor of a County Health Department based on the experience of Suffolk County, in which a Health Department has been in operation for a year.

The Tompkins County Medical Society met again on February 10, and adopted the follow-

ing resolution:-

Whereas: There is at present considerable discussion relative to the establishment of a

Health Unit in Tompkins County and,

Whereas: Much interest is being aroused in the county for securing more adequate facilities for the prevention of disease and the care of the sick, and,

Whereas: There is considerable misunderstanding relative to the means by which these

can be accomplished, 'and,

Whereas: This Society has, thru its committees first appointed in 1926, studied the health

needs of the county, and,

Whereas: These studies resulted in this Society recommending to the Board of Supervisors the establishment of a County Laboratory as the first important step toward the organization of efficient health work in the county, and,

Whereas: The Board of Supervisors approved the recommendations and established the Tompkins County Laboratory, the benefits of which have justified many times its estab-

lishment, and,

Whereas: The committee of this Society recommended that the second step toward the

improvement of public health in the county would be the construction of a suitable County Tuberculosis Hospital in or near the City of Ithaca, and,

Whereas: It is the opinion of this Society that the advance in preventive medicine as prescribed by the health regulations of the State are being well carried out by the health officers of the City and the Townships in the County and that the appointment of a full time County Health Officer at present would be an unnecessary expense, therefore be it,

Resolved: That this Society go on record as approving the county as the logical geographical area for health work; and further be

it,

Resolved: That this Society recommend as the next step in improving the health situation in the county, the building of a new County Tuberculosis Hospital in or near the City of Ithaca and increasing the facilities at the Ithaca Menorial Hospital in order that it may adequately care for the medical needs of the county; and further be it,

Resolved: That the County Health Unit, as generally understood with a full time health officer, would not be desirable or efficient until the above facilities are provided; and further be it,

Resolved: That the present laboratory and hospital facilities with those herein recommended would form a well equipped and accessible Medical Center for the county; and further be it,

Resolved: That a copy of these resolutions be sent the Board of Supervisors and the various health and welfare organizations in the county.

David Robb, M.D., President.

WILBER G. FISH, M.D., Secretary.

# THE DAILY PRESS

#### BLUSTERING MARCH

The unseasonably warm weather of the last week of February brought the robins and the red winged black birds to their northern homes, and even aroused the peeping frogs from their winter's sleep. But the New York Herald Tribune of February 26, gave a pictorial warning that Old Man Winter was still lurking around the corner, as every grandmother already knew.

March has always been notorious for its changeable climate from which warm April gave release with health. William Chaucer, at the close of the fourteenth century, describing a pilgrimage to the shrine of St. Thomas a Becket, opened his "Canterbury Tales" with the lines:

"When that Aprille with its showers swote The drought of March hath pierced at the root

Then liken men to go on pilgrimages
And specially from every shires end
Of England to Canterbury they wend,
The holy blissful martyr for to seek,
That them hath helpen when that they were
sick."

Winter now sees a continuous pilgrimage to the shrine of health as men create ideal April weather in their dwellings heated and ventilated with automatic stoves, supplied with stimulating light from vitaglass windows and ultraviolet lamps, and stocked with vitamines both known and unknown and imaginary.

How the record breaking warmth of the last week of February was victeed by J. N. Ding in the New York Hero'd Tribune of February 26, 1930.

### INFERIORITY COMPLEX OF THE BRIDGE PLAYER

The New York Times of February 26, described a lecture by Dr. Alfred Adler given in Columbia University on the interpretation of the psychological interpretation of the habit of bridge playing, and said:—

Dr. Alder held that most forms of unhealthy behavior are attempts to acquire superiority with the least effort. A member of the audience, evidently a bridge devotee, asked him to give his opinion of a person who spends most of his spare time at the game.

"Most people play cards to waste time," Dr. Adler answered. "Time, if a man is not courageous, is his greatest enemy. Bridge is

a great invention. A little of it is relaxation. But a lot becomes a mental habit, an attempt to satisfy a striving for superiority. It offers an opportunity to conquer others.

"If you see a bridge player who has won, you will notice a nice expression of superiority on his face."

"Nobody can bear to appear weak or inferior, and the person who is more interested in himself than in others usually develops a complex, the psychologist asserted. The superiority complex, he said, is only the mask with which the consciously inferior person conceals his weakness."

## UNBORN ASPIRATIONS

A brief poem may express a philosophical conclusion as clearly and vividly as a learned essay; and both may be founded on false premises and insufficient evidence. When James J. Montague considers those self-centered people whose object

"The alligator's skull contains A quarter of a pound of brains,

But these suffice to catch the prey Which in his maw he stows away,

And to enjoy the sun that beams Upon him as he basks and dreams.

His puny mind is never fraught With troubled and distracting thought;

Ambition's masterful behest Can never rob him of his rest; is to travel and sport and have a good time generally his verses in the New York *Herald-Tribune* of February 3rd, are not so unorthodox as they might at first seem to a serious minded philosopher or physician:

Nor does he ever speculate About the mystery of fate.

Although his intellect is crude, He always has abundant food

And room to swim and brood and bask—And that is all that he would ask.

Man battles hard for happiness, And place, and power and success,

But all his struggles are in vain, Despite his large and massive brain,

And I sincerely doubt if man Has got much on the saurian.

## SMOKE AND DUST IN THE AIR

The elimination of smoke and dust from New York City is receiving serious attention from the Department of Health and many analyses of the air have been made. An editorial in the New York Sun of February 6 says:—

"The wastrel who comes out of a night club at 4 o'clock in the morning and signals for a cab breathes in the few moments of waiting the city's purest air, with less than 1.1 pounds of dust particles to the million cubic yards.

"If a man is to enjoy in waking hours the purest air the city has to offer he must rise at 8 o'clock in the evening and go to bed at 6 o'clock in the morning. At 1 o'clock he can throw the covers back and take his fill of air until 3 o'clock. Once the home fires start burning he must close the windows until purity begins to steal over the city at 8 o'clock. It is confusing to those reared on Poor Richard."

The plans for purifying the air of New York City has recalled to an editorial writer in the New York Times of February 28, the pamphlet called 'Fumifugism' written by John Evelyn about 1661, and recently reprinted. The pamphlet described the pall of London smoke

and suggested ways of getting rid of it. The Times says:—

"He would have all 'Brewers, Diers, Sope and Saltboylers' forced to move five or six miles down the river. Butchers and chandlers he would also ban from the city 'because of their horrid stinks.'

"If these tradespeople refused to be ousted, he was ready with a second remedy. Sweet-smelling gardens were to be laid out in such profusion that their fragrance would mask the foul-smelling coal smoke. He particularly recommended the planting of rosemary, 'the flowers whereof are reported to give their scent above thirty miles at sea upon the coast of Spain.' His advice may be to some degree responsible for the large number of greens, gardens and open spaces in modern London.

"For the growing of flowers in public gardens the climate of London is more favorable than that of New York. But while our smoke and Summer heat may blight sweet-smelling flowers, we can still follow Evelyn's advice in the matter of abundant garden space. Even though our parks may not perfume the air, they can at least dilute its poisons."

# BOOK REVIEWS

VARICOSE VEINS, with Special Reference to the Injection Treatment. By H. O. McPheeters, M.D., F.A.C.S. Octavo of 208 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, \$3.50.

This book is a text of two hundred pages devoted to a variety of subjects, the majority of which are germaine to the caption.

The first few chapters are devoted to anatomy, embryology, etiology and diagnosis. They are as complete

as needs be and contain nothing new.

The chapter which contains the facts and conclusions on the subject of the direction of flow in varicose veins is not convincing. The data submitted is not adequate and the entire conclusion, which is not new, is contrary to the laws of hydraulics.

The discussion of all aspects of the injection treatment is completely and satisfactorily described, and comes in good grace from one who has had a con-

siderable experience.

Under the chapter entitled, "Complications Coincident or Associated with the Injection Treatment," he gives three fatal experiences. Instead of fairly facing the possibility of responsibility of the treatment, an evident attempt is made to evade that fact.

Case I died of coronary thrombosis after the treatment. Did the sclerosing solution accelerate the onset

of this calamity? He says it did not.

Case II died from diabetic gangrene four months after injection, due to a post injection diabetes with arterio sclerotic gangrene, all of which occupied but four months for its development. The spectator inquires did the injection accelerate the arterial sclerosis in the diabetic? Is not four months a rather short period for acute diabetes to develop such marked arteriosclerosis?

Case III died from just "severe symptoms" developing a few months after treatment, due to an underlying thromboangiitis obliterans. The author is most fortunate to have seen a case of this disease in the female. Very few students of this disease have been so fortunate. He should report it in greater detail.

The handling of ulcer cruris is according to the usual methods and two final chapters on hemorrhoids and

elephantiasis are irrelevant.

In summarizing, it may be said that the text, despite the tendency to understress contra-indications and complications of the injection treatment and possible remote effects of sclerosing substances in the blood stream, gives an excellent account of the usual sclerosing agents and how to employ them.

ROBERT F. BARBER.

A STUDY OF MASTURBATION AND THE PSYCHOSEXUAL LIFE. By JOHN F. W. MEAGHER, M.D., F.A.C.P. Second Edition. Octavo of 130 pages. New York, William Wood & Company, 1929. Cloth, \$2.50.

This is the second edition of a work which since its appearance in 1924 has held a high place in its field. The progress of the last five years is taken account of. The book shows every evidence of scientific and human insight, understanding and authority. A small work on this subject of such high character should be serviceable to a very large group of readers.

STATE BOARD QUESTIONS AND ANSWERS.. By R. MAX Goepp, M.D. Sixth Edition, revised. Octavo of 754 pages. Philadelphia and London, W. B. Saunders Company, 1929. Cloth, \$6.00.

This is the sixth edition of a now widely known work, which first appeared in 1908. It has been revised and reprinted at intervals during that time. In addition to brushing up the candidate for the State Board Examinations, this work might be of considerable service and interest to practising physicians who want to refresh their memory on work that they have not had occasion to investigate for a long period of time. It would seem inevitable, in revising a work of this kind from the standpoint of the more recent questions found in the State Board Examinations, that there should be a bringing up to date of the text, as

The book is attractively set up; paragraphed and divided into sections in such a way as to make it comparatively easy to find any given subject. The demand for such a book must continue, otherwise the need for frequent reprintings and revising of the editions would not exist.

STERILIZATION FOR HUMAN BETTERMENT. A Summary of Results of 6,000 Operations in California, 1909-1929. By E. S. Gosney, B.S., LL.B., and PAUL POPENOE, D.S.C. 12mo of 202 pages. New York, The Macmillan Company, 1929. Cloth, \$2.00 (A Publica-tion of the Human Betterment Foundation.)

This small book summarizes our knowledge of human sterilization. Most of this work has been done in California—6,255 operations up to January 1, 1929. In the United States as a whole there had been 8,515 operations up to January 1, 1928. The book states the problem, recites the history of sterilization, describes its effects, and discusses the voluntary and criminal phases of the subject, etc. Conclusions are presented in Part II, and then follow nine appendices which list the literature, present statistics, and discuss the medical and legal aspects of sterilization, etc. In Appendix VIII a Roman Catholic view is presented by an accredited priest who thinks that sterilization is, in principle, to be approved in suitable cases, but that the operations which are being done do not meet the necessary requirements because of any State is yet meaced by the propagation of its psychopaths, the inheritance of mental disease is still obscure, the possibilities of segregation have not been tested sufficiently, and the present technic of sterilization is not perfect and in some cases (X-rays) may even do more harm than good. A. C. J.

PROCEEDINGS FIRST COLLOQUIUM ON PERSONALITY INVES-TIGATION: Held Under the Auspices of the American Psychiatric Association, Committee on Relations with the Social Sciences. Octavo of 102 pages. New York. City, December 1-2, 1928. Balt., Lord Baltimore Press, 1929. Paper, 60c; Cloth, \$1.00.

Here we have leaders in the fields of Psychiatry and the Social Sciences, discussing their various viewpoints. Anyone interested in Psychiatry, Sociology, and Psy-

chology, should read this pamphlet.

The various speakers having different attitudes do not always agree. For this reason there is much mental food for the student. One speaker, evidently bewildered by the opposing ideas, referred to the epigram about the philosopher as being one who knew everything about nothing; and the sociologist as one who knew nothing about everything. At least this pamphlet will give one an idea as to how deeply other people think; and by contrast will show how some people do not think at all.

JOHN F. W. MEAGHER.

SURGICAL CLINICS OF NORTH AMERICA Published every other month by the W B Saunders Company, Phila delphia and London Per Clinic Year (6 issues) Cloth \$16 00 net, paper, \$12 00 net Vol 9, No 2, April, 1929 (Chicago Number)

This issue coming from the Chicago hospitals lists many famous names and is accordingly a valuable con tribution to our current surgical literature The ever important question of the acute abdomen is discussed as ably as usual by Arthur Dean Bevan Kellogg Speed presents his views on the ununiting fracture of the neck of the femur in a very convincing way A number of other interesting articles with numerous case histories and illustrations complete a volume which makes profit able reading for any surgeon

Vol 9 No 3, June, 1929 (New York Number)

The June issue of the Clinic is the New York number The subjects selected for discussion are, as usual, prac-

tical and diversified

Riedel's struma is treated very completely by Dr Heyd Some aspects of lung surgery are described and discussed by Dr Lihenthal Bone grafting in ununited fracture of the neck of the femur is Dr Albee's contribution to this well illustrated and well edited issue Numerous other articles coming from the pens of other prominent New York surgeons complete a valuable and interesting volume

Vol 9, No 4 August 1929 (Mayo Clinic Number)

The August number is a true reflection of the clinical and experimental work being done at the Mayo Clinic In it the practical surgeon will find descriptions of operations and valuable technical advice. The anatomist, physiologist and scientist will find interesting theoretical and experimental material carefully developed and well presented

YOUTHFUL OLD AGE How to Keep Young By WALTER M GALLICHAN 12mo of 236 pages New York, The Macmillan Company, 1929 Cloth, \$2 50

This book bears the title of "Youthful Old Age" as well as a sub title—' How to Keep Young" As medical men we know that only through good health can any old man hope to keep young, and so this book really deals with how to keep well

The rules which Mr Gallichan offers would be just as applicable to the young as well as to the old, to the sick and to the well. He stresses the importance of a sine life a life that makes sensible use of both mind and of body, a life of happiness of hobbies, and of

human interests

The writer recommends certain measures which may not win favor with many practitioners. He advocates vaccinations once or twice yearly as a protective measure against emphysema and bronchitis He also feels that vasectomy will be the principal method of rejuvenation in the future"

He discusses the causes of infirm old age and among them he lists worry auto intoxication, dietetic indiscretion and other factors which could be equally applied to most of the chronic degenerative diseases

But in general this is an extremely interesting book one which eliminates the sordid aspects of old age and which may be well recommended to all

METHODS AND PROBLEMS OF MEDICAL EDUCATION (Thir teenth Series) Quarto of 130 pages illustrated New York The Rockefeller Foundation 1929

The thirteenth series of the Rockefeller Foundation brochures is given over entirely to Vanderbilt University Theor plans and photographs of various departments of the medical school are amplified by concise well written text The Department of Illustration makes one envious

INTERNATIONAL CLINICS Edited by HENRY W CATTELL, A.M., M.D. Thirty minth Series Volume II Octavo of 305 pages, illustrated Philadelphia and London, J P Lippincott Company, 1929

Most doctors know what the International Clinics are Presenting clinical lectures on various aspects of medicine and surgery, written usually by men of high rank in America and abroad they are always worth reading In a book varying in subjects from 'In-tracranial Congenital and Developmental Aneurysms' by F Parkes Weber of England to 'Manners and Morals," by Lewellys F Barker of Baltimore the doc tor, no matter what his taste in medical reading will find in this as in any one of the volumes much that will interest him They will interest not only the country physician far from medical centers who has perhaps not heard a clinical lecture since the time he graduated from medical school, but will interest with their descriptions of rare conditions even the attending physician at the large city hospital. Not every one of the lectures is a classic, but a few of them are and enough are of such high grade that the book well de serves its position as one of our best clinical quarterlies It is unfortunate, however, that so few of the papers are written by men outside of the United States For instance of the nineteen clinics in the present volume only two are by foreign contributors. One could well wish to find in a book labeled International Clinics more of the clinics given by men in foreign lands, thus enabling the American physician to get the viewpoints of medical authorities in other countries

ISRAEL H MARCUS

PHOTOGRAPHS OF THE FUNDUS OCULI A Photographic Study of Normal and Pathological Changes Seen By ARTHUR J BEDELL, res containing 95 plates ges containing 95 s Company, 1929 Cloth,

\$43 W

The importance of this work for depicting fundus details as they change from day to day, thus making them available for purposes of study, will be immedi ately appreciated by those who have learned to examine fundus photographs and by those who have attempted to make accurate drawings of the fundus. The superior photographs, produced by excellent technic and faith fully reproduced make it possible for a busy practitioner to have available a wealth of material for teaching others. Abstracts of the histories of the cases photographed also add materially to the worth of this atlas

The author is especially to be congratulated upon his technic in taking the stereoscopic photographs which produce the effect so difficult to obtain with colored drawings. The single photographs should be studied with slight magnification, and the stereoscopic photographs by fusing the pictures with or without the aid of prisms in a trial frame

To produce pictures of the type depicted in this atlas requires much painstaking labor and long practice with the Nordensen camera, besides a perfected technic However, photographs of value for purposes of record may be made after a few trials

Case reports in the future will be greatly enhanced in value by the addition of a series of fundus photo

This first atlas in English should be followed by others Although the absence of color is at first notice able, the possibility of seeing a series of photographs depicting changes from day to day the exactness with which details are reproduced the freedom from in accuracies inherent in drawings and the effect of depth obtained overshadow the importance of seeing the colors to which we are accustomed but which are seldom accurately represented CONRAD BERENS

# The Physician's Gymnasium

McGOVERN'S is often referred to as "the physician's Gymnasium" because so many doctors send their patients here. Through investigation, they have found that McGovern's is the one gymnasium that bases its exercises and athletics solely upon the physician's diagnosis of the patient's individual condition.

We'll be glad to send any physician a guest card so that he may see, for himself, our facilities for carrying out his orders.

in local hospitals, where such are available, or at places most convenient to the individual groups.

"It has been decided to have two groups of lecturers, one in the northern part of the State and one in South Jersey. In the southern group, the teaching staff has been selected from the faculty of the University of Pennsylvania School of Medicine and the University of Pennsylvania Graduate School of Medicine. The lecturers for the northern section include members of the faculty of the University and Bellevue Hospital Medical College and the Cornell University Medical College.

"In each section the curriculum will be identi-There will be eight lectures on General Medicine and eight upon Traumatic Surgery, to be given weekly during April and May. The registration fee has been placed at \$30 per person per course, and will be used for the payment of lecturers and other expenses required in the operation of the classes.

"The subjects to be considered have been announced as follows by the Educational Committee:

#### GENERAL MEDICINE

Diseases of the Blood—(1 lecture). Pneumonia—(1 lecture). Cardiac Diseases—(2 lectures). Renal Diseases—(2 lectures). Recent Advances in Therapy—(2 lectures).

#### TRAUMATIC SURGERY

(1)Treatment of Minor Injuries.

(2) Infected Wounds, Especially of the Hands.

(3)Common fractures.

(4) Head Injuries.

(5) Internal Injuries.

Joint and Tendon Injuries. (6)

Osteomyelitis.

Burns and Asphyxiation."

#### STATE MEMBERSHIP AND DUES

The February issue of Northwest Medicine contains the following information regarding dues in the States of Washington and Oregon:

"At the meeting of the American Medical Association in Portland last July, Dr. Olin West, secretary of the Association, in his annual report of the House of Delegates presented a table, showing the percentage in each State association of its membership to the licensed physicians of the State. (See this Journal, March 1, 1930, page 306.) New Hampshire appears at the head of the list with 87 per cent membership. Washington is twelfth with 72 per cent, while Oregon stands forty-seventh with 49 per cent and Idaho forty-

(Continued on page 365-adv. xiii)

(Continued from page 364-adv xu)

eighth with 45 per cent. One naturally inquires why this variation in adjacent States The explanation probably lies chiefly in the methods of financing the State organizations, which present an interesting field for speculation The Washington system provides for the payment through the treasurers of the county societies of five dollars per member as State association dues Each county society collects dues for its own purposes, ranging from a minimum of a few dollars per member to a maximum of twenty-five dollars in Kings County for those who have been in practice for more than six and less than twenty-six years, the fee for the two latter groups being sixteen dollars, this fee also including that for the State association.

"In contrast to this system the Oregon State society has annual dues of twenty dollars per member, which includes membership in the public health league and medical defense fund. This sum is paid directly to the treasurer of the State society without reference to the county societies, each of which collects dues for its own purposes. In the Idaho association where a similar plan is followed, the dues are forty dollars per year, all members likewise doing their share in supporting the public health league and medical defense fund. If all members in Washington had

membership in these two organizations, their dues would be increased by the sum of thirty dollars. At the present time these memberships are optional, so that all do not participate as in Oregon and Idaho. If these items were included in the annual dues, probably there would be a noticeable decrease in the Washington membership, as is noted in the other States"

#### NATIONAL BETTER HEALTH BUREAU, INC., OF PROVIDENCE

This Journal of August 15, 1929, page 1046, quoted an article from the Rhode Island Medical Journal of July, 1929, condemning the National Better Health Bureau, Inc, which had been organized within a year, with purposes similar to those of the Life Extension Institute, Inc, of New York City. This Bureau apparently went the limit in the use of spectacular forms of commercial lines, and thereby incurred the criticism of the medical profession of both Rhode Island and Massachusetts.

The Bureau is discussed in the New England Journal of Medicine of January 16, 1930, which contains the following report by Dr. David Cheever, Chairman, Committee on Ethics and Discipline, Massachusetts Medical Society:

DAVIES, ROSE & CO., Ltd.
Pharmaceutical Manufacturers Bosto

O., Ltd. Boston, Mass. (Continued from page 365-adv. xiii)

"Complaint was made to the Committee on Ethics and Discipline of the activities of an organization called "The National Better Health Bureau" of Providence, R. I., which described itself as "A Scientific Bureau, organized as a humanitarian, semi - philanthropic organization upon a business basis." Its Health Director was our justly respected Fellow Dr. William R. P. Emerson, (Dr. Emerson wishes to have his name used) of Boston, and with him were associated other (no less respected) Fellows of our Society, and certain physicians of Providence, members of the Rhode Island Medical Society. Severe criticism of the undertaking was expressed by the physicians of Providence; an invitation to Dr. Emerson to address the Providence Medical Association on the subject was withdrawn, and local physicians associated with the Bureau were urged to sever their connection on the ground that it was unethical.

"Investigation by the Committee on Ethics and Discipline showed that the National Better Health Bureau (let us call it the 'Bureau' for short) was organized by three business men, one of them lately in the insurance business, who conceived the idea of 'selling health diagnosis and health service at a fair cost.' A corporation was formed, quarters were secured and Dr. Emerson was engaged at a salary as Health Director. An aggressive advertising campaign for patients was launched, consisting of advertisements in the daily press, often pictorial in character, extolling the importance of health, offering 'First, a complete and thorough Health Survey . . . a Health Diagram, followed by a sound practical health program suited to the individual requirements of each youngster . . . and a special yearly health service at a special price,' and describing the spaciousness and conveniences of the Bureau's quarters. To most of these advertisements was suffixed the name of Dr. Emerson as Health Director. In addition, circulars were distributed. a house to house canvass conducted, an automobile sent about the streets of Providence and a radio broadcast established in which the Health Director's success in promoting the health of Dartmouth College athletic teams was noted. These details are given to show that scarcely any of the practices common to commercial advertising were omitted, and that the Bureau saw the wisdom from a business point of view of capitalizing Dr. Emerson's high reputation.

"Dr. Emerson believed that he could avoid possible criticism by not administering treatment of any sort and by not referring patients to any special group of consultants for treatment of any pathological conditions discovered, but counselling them to call in their regular advisers. As evidence of the actual benefits accruing to the phy-

(Continued on page 367-adv. xv)

(Continued from page 366-adv xiv)

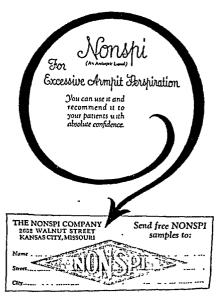

sicians of Providence through the activities of the Bureau, Dr. Emerson calculated that the first hundred patients applying for 'health diagnosis' may theoretically have paid fees totalling \$5,000 to their physicians, if they carried out the recommendations of the Health Director.

"In conferences with the Committee on Ethics and Discipline Dr. Emerson stoutly maintained that 'Health Diagnosis' is an activity quite distinct and apart from the functions of the practicing physician (which apparently should be confined to the treatment of disease) and declared that methods of publicity and self-advertisement intolerable if practiced by a regular physician are commendable and desirable if used by a physician who makes his living by practicing 'Health Diagnosis.' To quote him: 'The question of advertising in Health Diagnosis work is quite different from the question of advertising in medicine; . . . it seems to me that the whole matter rests on the question of what distinction there is between health work and medical work. And he adds: 'There seems to be a feeling

abroad that the physician resents health work. "The Committee on Ethics and Discipline unanimously reached the conclusion that the National Better Health Bureau was a commercial organization incorporated by business men for profit and securing patients by publicity and advertising methods which offered unfair competition to reputable physicians to whom the advertising columns of the lay press are not open. They were entirely unable to see any essential distinction between 'Health Diagnosis' and regular medical practice. They pointed out that every general practitioner is, or should be, not indeed a national but rather a local 'Better Health Bureau,' and that the Bureau's own definition of itself as a 'Scientific Bureau, organized as a humanitarian, semi-philanthropic organization upon a business basis' is justly applicable to the regular physician. They felt that every conscientious physician assays the health of his patients, considers their conditions of life, their habits and conditions of work, of play and of repose, their habits of eating, of thinking, of exercising, of resting, of emotional feeling, of defecating,-in short all those factors especially claimed by Dr. Emerson as the peculiar property of the health diagnostician. The Committee expressed their view to Dr. Emerson and his colleagues with every assurance of their realization of the single-mindedness and purity of their intentions. His colleagues have severed their connection with the Bureau but, if the Committee understands the situation correctly, Dr. Emerson has not yet done so:-very likely because he thinks it unnecessary inasmuch as the Bureau has closed its doors. It seems evident, however, that Dr. Emerson is unconvinced,

"This problem is typical of those which are becoming more and more frequent at the deliberations of the Committee on Ethics and Discipline. The present age of publicity, advertising, of effort to promote the health of the people by public or quasi-public agencies such as Boards of Health, insurance companies, industrial clinics, school clinics, charitable hospital clinics, and by radio broadcast health talks, tend more and more to attract patients from the office of the regular general practitioner, and in some instances to advertise a physician or group of physicians who are the instruments of these agencies. As a whole these efforts appear commendable when directed by regularly organized charitable agencies. What shall be our attitude about Dr. Emerson and the National Better Health Bureau?

"The Committee on Ethics and Discipline is the servant of the organized regular physicians of Massachusetts, charged with the duty of interpreting the ethical professional standards adopted by those physicians. These problems are becoming acute. Let us have discussion and guidance."

# CARE OF THE INDIGENT SICK BY COUNTY MEDICAL SOCIETIES IN IOWA

The care of indigent sick by County Medical Societies in Iowa was discussed in this Journal of February 15, 1929, page 245. The plan was that the county medical societies should enter into a contract with the county officials to give medical service to the indigent poor at specified rates. The income pays the dues of the members in the county and state societies, and provides the means for carrying on all the activities of the local societies. Contracts had been made by four counties—Harden, Marion, Marshall, and Webster, while Waterloo county had a contract applying to the City of Waterloo only.

The Journal of Iowa State Medical Society of February has an article by Dr. J. I. Marker of Davenport, Iowa, describing a contract made in Scott County, which contains 70,000 inhabitants, and about fifty doctors. The article says:—

"It seemed desirable that the doctors as a business organization take over the entire responsibility for delivering medical care of all kinds to the part of the population dependent upon public charity.

"Fifty practitioners cannot act in accord from one motive, but they can find that different motives can make them act as one. To some, the words of the Secretary of the American Medical Association, Dr. Olin West, were the activating motive: 'The one great outstanding problem before the medicai pro-

(Continued on page 369-adv. xvii)

(Continued from page 368-adv. xvi)

fession today is that involved in the delivery of adequate scientific medical service to all the people, rich and poor, at a cost which can be reasonably met by them in their respective stations of life.' Others of the profession saw the need of the medical men taking hold and controlling the dispensing of free or semi-free medical service in the community while we can control it and before we reached such a problem as the profession in Chicago and elsewhere had on their hands in the past. To a number of the men there was the appeal of the opportunity to work together with other men on cases where jealousies would not be encouraged, and where we all would receive the inspiration and tempering of judgment which comes from professional contacts. But whatever the motives in our minds, fifty members of the Scott County Medical Society have signified their intention of working together in a contract with the County Supervisors, and have morally bound themselves to both give and take to the extent that our work be a success.

"It was necessary for the county medical

society to incorporate in order that we could do business as a group, and not necessitate the making of a contract by any one individual. In November 1929, the Scott County Medical Society voted to incorporate, and elected a board of nine trustees, who formed the Scott County Medical Society, Inc., and voted membership to all members of the society. The business affairs of this incorporated society are the function of the Board of Trustees. This board elected for three year terms has its own president, vice-president, and secretarytreasurer, and at present the business dealings of the corporation are kept separate from the functions of the unincorporated society, such as collecting dues, electing members and providing programs.

"Our contract with the Board of Supervisors provides that we 'furnish all medical and surgical care and treatment, as may be required during the calendar year 1930 for County patients of said Scott County, Iowa, arising within the City of Davenport, the City of Bettendorf, and of Davenport Township, in said County.' The balance of the County, where there is comparatively little poverty is to be

LEDERLE ANTITOXIN LABORATORIES
NewYork

(Continued from page 369-adv. xvii)

cared for on order of the supervisors or their agents as in the past. The contract was made to cover all service of any kind usually expected of physicians, and the only exceptions were in the matter of certain expenditures for drugs, which might not be under the control of the physicians. For that reason charges for surgical appliances, trusses and serums, toxins and antitoxins are paid by the Board of Supervisors. All other treatments, drugs, x-rays, and other laboratory work is paid for by the county society, unless the patient becomes hospitalized when the Supervisors pay hospital charges.

"The plan includes a daily clinic of one or two hours held at the Visiting Nurses Cottage, which is referred to as the clinic; a system of referring patients for special work and consultation, and a system of assigning patients in the hospital for care. House visits and calls are made by a physician, who is paid a stated salary for this work. The work of the venereal disease clinic, which was established in war time is done by a physician hired by the society.

"The clinic is maintained by volunteer workers, who have a regular schedule for their hours spent there. These men of whom there are twenty, are given first preference in assignment of cases to be cared for in the local hospitals. All members of the Scott County Medical Society are welcome to visit any county patient, and note their observations on the hospital record, but the actual directing of the care of the patient is under one man to whom they are assigned. The Consulting Staff, of whom there are thirty men, is made up of those men who will be willing to take a case that has been worked up in the clinic, and make special examinations or give the benefit of their experience to the physician under whose care the patient is placed and who asks for the consultation. The different men who give their time in any capacity are permitted to designate the specialty or departments in which they wish to work. With out dictation or criticism of their choice of work the men are assigned alphabetically on any list on which they wish to be placed. It was felt to be the fairest manner of dividing the work, and one which would cause the least criticism.

"When any patient, not a county charge is sent to the clinic for diagnosis or treatment, that case is to be accompanied by a social history which was agreed upon by the different charitable organizations from which we might receive cases such as the Davenport Visiting Nurses Association, Ladies' Industrial Relief, Catholic Charities, etc. On the basis of this social history, the Board of Trustees can de-

(Continued on page 371-adv. xix)

(Continued from page 370-adv vviii)

cide as to the ability of the patient to pay a fee to their family physician or their eligibility to the clinic. This will in time, if kept up, give the Scott County Medical Society a basis on which to decide as to whether they are charity patients or not, and if later we take patients on part-pay plan, it will give us a standard of their ability to pay

"The hope of the active members of Scott County Medical Society, Inc., is that from this united effort will come an active united medical society in which the members can have confidence, and whose members will develop increased confidence in the ability and honesty of purpose of each other. By this plan and the changes which will come, we can control and direct the charitable efforts of our members and serve the community. If there is later a demand for a part-pay clinic, it can come when the profession is ready for it and we will have a working organization under the control of the medical profession, and not under control of a few men or a lay group."

The Journal also states that a similar plan has been adopted in Sioux City.

#### ETHICS OF PUBLICITY IN INDIANA

The minutes of the weekly meeting of the Bureau of Publicity of the Indiana State Medical Association held on November 22, 1929, contain the following entry as recorded in the January issue of the Journal of the Indiana State Medical Association.

"The question was put to the Bureau of Pubheity concerning the ethics of the following: An article, written by a physician, which commented upon certain medical uses of tomato juice, appeared in The Indianapolis Medical Journal. A canning company asked THE JOURNAL for the permission of making reprints of this article and sending them to physicians The editors of THE JOURNAL asked the Bureau of Publicity for its opinion concerning the ethics of doing this. The opinion of the Bureau was that reprints could be sent provided nothing was mailed with them which would give a direct or indirect tie-up between the article written and any commercial product sold by the company. It would be all right, according to the Bureau, to mail the article plain, without any letterhead, any accompanying letter or envelopes, or any accompanying literature, which would name the company in any way.

#### STUDENTS' LOAN FUND IN KENTUCKY

The proceedings of the House of Delegates of the Kentucky State Medical Association held on October 21, 1929, and recorded in the February issue of the Kentucky Medical Journal, contain a report of the Committee on Students' Loan Fund, which describes the loan funds administered under the auspices of the several women's organizations for the benefit of students in normal schools and colleges. The Committee of State Medical Association published an editorial setting forth its plans for loans to students in the Schools of Medicine and of Laboratory Technique. The Committee reported the following results:

"As soon as that editorial was published we received a letter from Henderson County Medical Society saying that they thought it was one of the best projects the Kentucky State Medical Association was doing, and they want to go on record as being the first society to endorse it and send a check for \$25. This fund is to be deposited with the usual fund of the Kentucky State Medical Association and to be dispensed by the House of Delegates and by the Council. We are to solicit funds from the members of the county society and from the members of the alumni of the University of Louisville. This student fund is to be given the Kentucky boys and girls for the Kentucky University.

"The Committee felt if we paid a sufficient sum to a boy or to a girl to give them their entire education they would have the privilege of asking that boy or girl to go to a community where there were no physicians and to stay there until they made money enough to refund the loan. I recently met a doctor from the eastern part of Kentucky and he told me he gave a boy \$4,000 to take a medical course. He said that boy went to a certain section of the state that he designated and in two years paid back the \$4,000.

"I said, 'Doctor, I hardly believe that.' He said. 'It is absolutely true. I am going to will \$50,000 to the student loan fund.

"I think this is really one of the forward movements that the Kentucky State Medical Association has taken part in. Dr. Moore said, that a medical student may be in some unfortunate circumstances, that may occur in his Junior or Senior year and he absolutely needs \$100 to finish the school, and he just cannot get it anywhere. By this fund we are aiming to help those worthy boys and girls, lending them \$50, \$100, \$200, or probably \$300, as the Committee thinks fit to do. I have had so much experience the last seven years with young boys and girls trying to get an educa-

(Continued on page 373-adv. xxi)

(Continued from page 372-adv. xx)

tion, that I have really become more and more favorably impressed with a loan fund.

"The question came up in a great many minds, 'Will these students pay it back?' Student loan funds have been made to 2,700 students in the Western State Normal School and not a nickel has been lost. I have given twenty-five girls and boys in my laboratory course student funds and I have never lost a nickel.

"We ought to appeal to those doctors who have no responsibilities in life, doctors who are bachelors, widowers, or something like that, who can give up this money to help educate some of these less fortunate students, so I am hoping that we can make a better report of this organization next year."

#### STUDENT HEALTH SERVICE

The Committee on Public Relations of the Medical Society of the State of New York is investigating the subject of health services in colleges. An article in the January issue of *Illinois Medical Journal* beginning on page 58, written by Dr. J. H. Beard, Urbana, Illinois, closes with the following paragraph:

"Student Health Service: A student health service is a health center within an institution of higher learning. It is dedicated to the conception that constructive dynamic living in the best environment that modern science can provide is the rightful inheritance of every individual. To attain this ideal, it teaches the student the principles of hygiene and sanitation as they relate to him, to his home, to his vocation and to his community. Its methods are classroom instruction, the periodic physical examination, the personal conference, demonstration of disease control and the maintenance of sanitary surroundings. It strives to reveal to the leader of tomorrow the benefits to be derived from hospitalization, public health and modern medicine because such knowledge will mean such to him, to his family, to his community, to diagnosis, to treatment, to the equipment and maintenance of hospitals, and to national vigor.

"It is not the purpose of health services to pauperize nor paternalize students nor to socialize medicine; but they do covet opportunities to do their part in putting the college graduate and the physician shoulder to shoulder to mutual advantage in serving the public, in advancing modern medicine and in making a better world."

#### CHILD WELFARE SCHOOL BY SCOTT COUNTY MEDI-CAL SOCIETY, KENTUCKY

The January issue of the Kentucky Medical Journal has the following description of a school to be conducted by the Medical Society of Scott County, Kentucky

"The proposition of the State Health Department to make Scott County the center of Eastern Kentucky for a school of instruction in maternity and child welfare was formally accepted by the Scott County Medical Society at the regular meeting held December 5th, at the Garth City School, with a delightful dinner.

"The School will be under the direction of the state health department, represented by Dr. Veech and financed by the Rockefeller Endowment for Public Health. Assisting will be a woman physician, who will be a maternity and child specialist and an added nurse.

"The work will be done in cooperation with the Scott County Health Department. There will also be a committee of three appointed from each of the civic organizations in Georgetown and Scott County to assist in carrying out the program. The committee appointed last meeting from the Scott County Medical Society, by the president is composed of Dr. H. V. Johnson, Dr. W. S. Allphin and Dr. L. L. Cull.

"To this school health officers and nurses and other doctors and nurses and other doctors and persons throughout Eastern Kentucky, who are interested in child welfare, will come to observe the methods of the school and plans for constructive health measures along these particular lines."

#### POLAND SPRING COMPANY

Dept. C 680 Fifth Avenue New York City County Medical Society was held on December 26th, at which time the newly elected officers were installed.

"Beginning with the new year, the society is contemplating putting on a unique contest for a handsome prize to the member of the organization who during the year prepares and delivers the best scientific paper before the society. A committee has been appointed to work out the details of the contest and to select and award the prize at the end of the year 1930."

#### PARENT-TEACHERS ROUND-UP OF CHILDREN IN CALIFORNIA

The January issue of California and Western Medicine has the following description of a roundup of children of pre-school age after the plan of Iowa (see the N. Y. JOURNAL October 1, 1929,

page 1232).

Nearly thirteen thousand California children who entered school for the first time this fall, were given physical examinations by the Bureau of Child Hygiene of the State Department of Health, in cooperation with the California Congress of Parents and Teachers. Most of these children live in the rural districts of the State, where organized facilities for child care are not available. Forty-eight counties of the State were covered in the campaign. Examinations were conducted by competent physicians, many of whom donated their services. The examining physicians noted the condition of the heart, lungs, eyes, ears, nose, throat, teeth, and the weight and posture of the children. They recorded conditions which were necessary for correction and advised the parents to secure such corrections from local physicians before the child was permitted to enter school. The most commonly encountered defect was decayed The next most common defect encountered was diseased throat and nose. A large number of the children were found to be underweight and faulty posture was a commonly found defect."

## THE MEDICAL DIRECTORY

THE MEDICAL DIRECTORY OF NEW YORK, NEW JERSEY AND CONNECTICUT contains 910 pages of text relating to the individual doctors. It also has 48 pages of advertisements containing the announcements of 58 dealers and institutions on whom physicians depend for service and supplies, from abdominal supporters to X-ray apparatus. Patronize them whenever possible. They are reliable and appreciative.

Quadrex Transformer

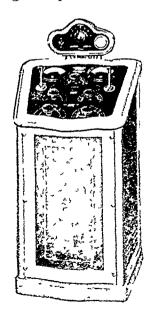

ODERN roentgenology demands speed in radiographing many body parts, because speed is the only means of overcoming lack of detail due to the natural movement of organs. This is particularly true in cardiac teleradiography, examination of the gastro-intestinal tract, and in cholecystography, and also in general radiography of children and neurotic patients, where immobilization is difficult.

The Wappler Quadrex, because of its enormous useful radiographic output obtained with negligible voltage drop, makes possible exposure of moving organs at speeds hitherto considered impossible.

To utilize this remarkable apparatus to its utmost capacity, a new type of timing and breaking mechanism—the Chronex—has been developed in the Wappler Research Laboratories. It makes possible the breaking of several hundred amperes without the least arcing at the making or breaking of contact which occurs at the "no-voltage" part of the alternating current cycle. It permits exposures of as fast as one impulse—1/120 of a second—and its range is up to ¼ of a second.

The time switch for the selection of exposure time is conveniently located at the top of the Quadrex control panel and remotely controls the timing and breaking mechanism, which may be located wherever convenient.

Quadrex Control Panel, swith Chronex Time Switch

Send for Bulletin 109-G, describing the Wappler Quadrex Apparatus and Chronex Timer.

CAN GELATINE PUT MORE DIGESTIBILITY INTO MILK-AND MORE NOURISHMENT UNDERFED, UNDERWEIGHT BABIES?

> You undoubtedly know that many eminent physicians have written much on the value of gelatine as an aid to the digestibility of cow's milk for babies.

> The protective colloid in Knox Gelatine modi-fies the curdling of the milk by the natural acids and the enzyme rennin of the infant stomach—thereby tending to reduce colic, regurgitation, the passing of undigested curds, etc.

that the ad

the baby's to increase weight.

Knox Gelatine is an excellent protein-uncolored, unsweetened, unflavored, unbleached. It has been prescribed by the medical profession for more than 40 years in cases of infant malnutrition. Be sure you specify Knox Gelatine-the real gelatine-when you prescribe gelatine.

The following is the formula prescribed by authorities on infant feeding: Soak, for about 10 minutes, one level tablespoonful of Knox Sparkling Gelatine in one-half cup of milk taken from the baby's formula; cover while soaking; then place the cup in boiling water, surring until gelatine is fully dissolved; add this dissolved gelatine to the quart of cold milk or regular formula.

We believe the booklets listed below may prove helpful in your practice. Please fill out the coupon for

complete data.

## DNEUMONIA

and its treatment with

#### Antipneumococcic Serum Lederle

Refined and concentrated as prepared by FELTON

#### **ADVANTAGES**

#### Smaller Bulk-

Average volume is about one tenth that of the original serum.

#### Minimized Serum Reactions-

Serum reactions are minimized due to the elimination of inert foreign proteins.

#### Standardization in Units-

This makes it possible to use the product with more certainty of adequate dosage.

#### Procedure

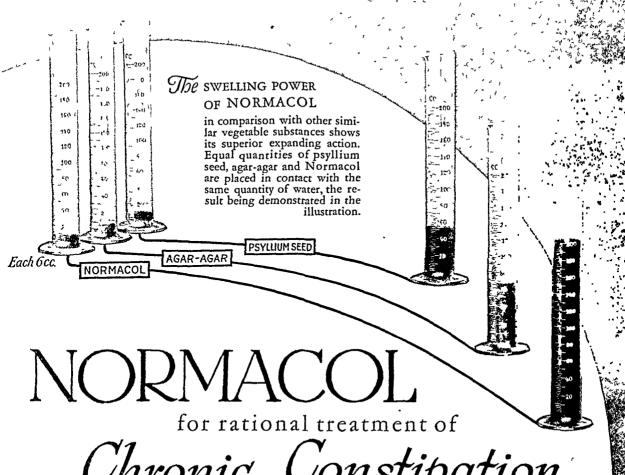

10,000 to 20,000 units should be injected at the earliest possible moment after diagnosis.

Repeat every B hours until the temperature falls and beneficial effects are evident. If the disease is severe and the patient very toxic, double the unit dosage at 4 hour intervals.

Antipneumococcic Scrum (Lederle) is supplied in syringes containing 10,000 and 20,000 units each of Type I and Type II.

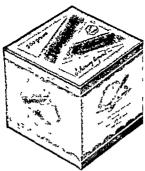

A Treatise on Pneumonia will be sent upon request

# The Story of COD-LIV-X

HEN the history of the vitamins is written at some future day, no small part of it will deal with the cod-liver oil concentrates of which Cod-Liv-X is the forerunner and so notable an example. For, notwithstanding the universal recognition of the importance of cod-liver oil as the world's one practical source of supply for the fat-soluble vitamins, generations of physicians have signally failed to popularize it as a routine prophylactic in the home because of the public's antiputhy to its nauseous taste.

The value of the oil as an antirachitic, its ability to increase body resistance to many diseases and infections; even its effect upon longevity, with its other innumerable benefits to mankind cannot equal the objections in the public mind to the physical properties of a fish oil. Meanwhile we are living in an age which is making scientific history for it is just eighteen months since Cod-Liv-X was first offered and about three and a half years since the research was begun which ted to the perfection of this appendid prophylactic agent.

Willie world-wide confidence in cad-liver oil therapy in rickets, tetany, and the so-called "wasting diseases" has been the heritage of the physicians for more than a century, it is only within recent years that any scientific reason could be shown for its accredited virtues. Recognition of the existence of the two fat-soluble vitamins,—Vitamin A, the builder, the promotely of growth and well being, and increased resistance to infection; and of Vitamin D, the amirachie, supplied the raison d'etre.

Research has since shown that these two vitamins, representing practically the sum item of cod-liver oil values, are combined with but a small fraction of the oil that remains unchanged after its saponification. This unsaponifiable, vitamin-bearing fraction is separable through the use of suitable agents. Separation of Vitamin D from the oil by this method is perfectly practical, but the extremely unstable Vitamin A was almost

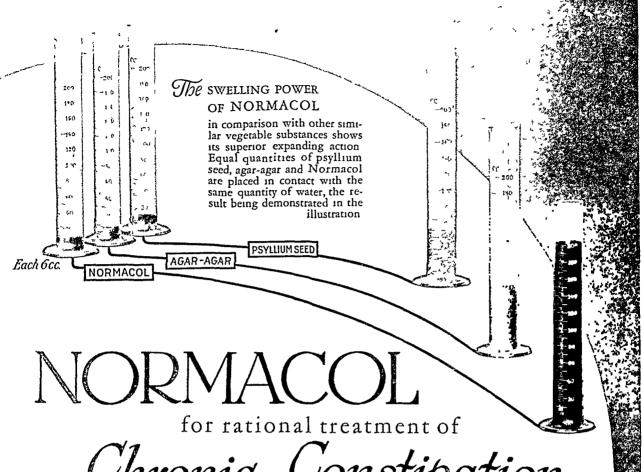

wholly lost until the improved

processes developed for Cod-Liv-X were perfected. Cod-Liv-X is the culmination of more than three years of intensive research in the Health Products Laboratories, supervised by research workers of national reputation in this field. To their efforts is afcredited the development of probably the first prefetcal method and apparatus for maintaining the potency of vitamin A, both throughout the maguifacturing process, and in the finished wafer.

manufacturing process, and in the finished wafer.
For practical purposes, Cod-Liv-X should be considered as representing the Vitamin A and D
potency of a rigidly tested cod-liver oil, but
free from the disagreeable characteristics
that have made the oil the bugbear it is.
Cod-Liv-X wafers are standardized to an

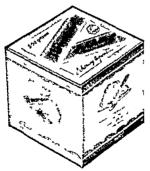

quivalent waters are standardized to an quivalent of not less than a teaspoonful of biologically tested U. S. P. oil. But it is not only at the time of manufacture that Cod-Liv-X wafers are so tested,—they are rested at intervals for potency and stability, so that vitamin potency and dependability are definitely assured.

COD-LIV-X is not only a dependable antirachitic,—it is a potent Vitamin A concentrate as well. It is the first cod-liver oil concentrate systematically sted over long periods of time for both Vitamin A potency and stability. Cod-X offers a greater degree of accuracy and stability than cod-liver oil itself-convenient to administer and as palatable as candy. The objectionable taste are eliminated without loss of value.

# Chronic Constipation

is a harmless therapeutic agent which possesses extraordinary swelling properties.

#### NORMACOL

consists of the coated granules of a species of bassorin sap with about 1% cascara sagrada. (One fifth U.S.P. dose to one teaspoonful) It increases the volume of the residual matter in the bowels, thus establishing a soft and non-irritating bulky evacuation, without pain, griping or digestive disturbances.

DOSE: One to two teaspoonfuls, after meals, taken dry on the tongue and followed by a draught of water, without chewing

Supplied in 100 and 200 gram packages.

# Know about COD-LIV-X

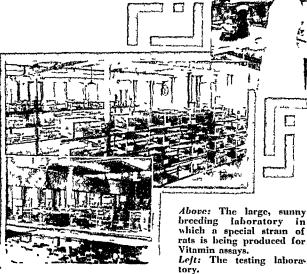

#### Vitamin D

VITAMIN D is the antirachitic, the controlling factor of the phosphorous-calcium equilibrium and the promoter of mineral metabolism. Diets deficient in Vitamin D lead to nervous instability and muscular weakness, with evidences of rachitic lesions or tetany. Its complete absence from the diet will certainly result in rickets and skeletal deformities. According to Eliot, after a survey made of the prevalence of rickets in New England, some evidence of rachitic lesions is almost universally present in the child population of that great commercial district. Vitamin D is the great rachitic prophylactic which should be a routine in every home with a child population.

Below A tech nician about to weigh rats A step in the Vitamin A assay

Repeated assays at intervals have been conducted on the first Cod-Liv-X concentrate since its production 18 months ago. In this chart is a running record of the results of these tests which shows that there is no evidence of Vitamin A loss since the concentrate was first produced.

OD-LIV-X is standardized by the generally accepted methods of biological assay. The McCollum line test is used for Vitamin D and the Vitamin A test is made both according to weight and the development and control of xerophthalmia. The latter is not specified in assays of oil according to the U. S. P. But we check with it to assure full Vitamin A potency. Further more, Cod-Liv-X tablets eighteen and there is no . # COD-LIV-X

## A Dependable Safeguard Against Winter Ills

ISDAIL and Brown in Toronto, and Dorno in the Swiss Alps. found the prophylactic and therapeutic effect of summer sunshine to be from 8 to 10 times greater than that of winter sunshine. Sherman concluded that the level of intake of Vitamin A markedly influences susceptibility to colds and other respiratory infections. We may conclude that the prevalence of winter "colds" is in some way related to the observed deficiency of Vitamin A.

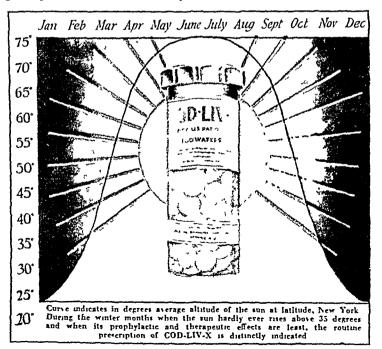

A supplementary supply of vitamins, both A and D, during the months of decreased sunlight, is thus clearly indicated. Cod-liver oil is the standard source of supply of Vitamins A and D. But it is frequently a problem to get the average child or adult to take the very unpalatable cod-liver oil, as such.

COD-LIV-X is concentrated cod-liver oil in tasty, attractive, palatable wafer form, each wafer embodying stable, measurable amounts of vitamins, both A and D. In COD-LIV-X the physician has available a routine prophylactic against the many diseases and infections common during the cold months of the year.

#### What Cod-Liv-X Is

- 1. It is as dependable an antirachitic both for prophylaxis and treatment as the carefully selected, biologically tested cod-liver oil from which it is made.
- It is biologically tested for vitamin potency both at the time of manufacture and at intervals subsequently to insure potency and stability.
- 3. It provides greater accuracy in vitamin unitage and assured potency in a convenient form.
- 4. It avoids exposure of the unstable Vitamin A to dust and consequent oxidation, rancidity, and loss of potency.
- Cod-Liv-X is as palatable as candy—and as readily administered.

## Announcement

BENDINER & SCHLESINGER desire to announce that their X-ray Staff has been augmented by the appointment of Edward E. Kaplan, M.D., former Director of the Radiological Laboratory of the Gallinger Municipal Hospital and Clinical Professor of Roentgenology in the George Washington University Medical School, both of Washington, D. C., as Director of their X-ray Laboratory.

The X-ray department is maintained for the service of physicians only and occupies the entire street floor of our new building specially erected, thus avoiding stairs or elevator, making it most convenient for your patients.

Visitors cordially welcomed. Correspondence invited.

# An Effective Ally in the Treatment of Pneumonia

Anything short of major calibrein a diathermy machine for the treatment of pneumonia will prove disappointing. The Victor Vario-Frequency Diathermy Apparatus is designed and built specifically to the requirements. It has, first, the necessary capacity to create the desired physiological effects within the heaviest part of the body; secondly, a refinement of control and selectivity unprecedented in high frequency apparatus.

In the above illustration the apparatus proper is shown mounted on a floor cabinet, from which it may be lifted and conveniently taken in your auto to the patient's home.

A REPORT from the Department  $\bigcap$  of Physiotherapy of a wellknown New York hospital, dealing with diathermy in pneumonia and its sequelae, states as follows:

"As a rule diathermy is indicated in acute pneumonia, especially so when the symptoms are becoming or already are alarming: the temperature is high, the patient is delirious, the pulse is extremely rapid, cyanosis is deep, the respiration rate is high, the breathing is very shallow, and the cough remains unproductive. Not infrequently in a pneumonia case with such alarming symptoms, after a few diathermy treatments an entire change of the picture takes place: cyanosis lessens, respiration becomes deeper, the quality of pulse improves, the rate decreases, the

THERE are many scientific reasons for the phenomenal success of BiSoDoL, the balanced antacid, so extensively used for quickly and effectively controlling the familiar symptoms of gastric hyperacidity—"sour stomach," acid cructations, heartburn, nausea and vomiting; and for systemic alkalinization in the prevention and treatment of colds and respiratory affections, cyclic vomiting and the morning sickness of pregnancy.

Perhaps the most outstanding factors in its favor, which make a strong appeal to physicians, are the combination of speedy relief with control and safety in use.

Massive doses of single alkalis may tend to set up a dangerous alkalosis, but in BiSoDoL the combined action of magnesium carbonate with sodium bicarbonate helps to prevent such untoward results.

In addition, BiSoDoL contains bismuth subnitrate, antiflatulents, and flavoring which enhance its value in dyspeptic conditions, and render it very acceptable to the patient.

BiSoDoL is advertised solely to the medical and allied profession.

#### CANCER AS A WORLD PROBLEM\*

By JOSEPH COLT BLOODGOOD, M.D., BALTIMORE, MD.

Clinical Professor of Surgery, Johns Hopkins University

Cancer is a Problem of medical education of both physicians and laymen; of Research; of Worldwide cooperation; of Public Health; of the Medical, Dental, and Nursing Professions; of the Social Service Worker; of the Expectant Mother and the Mother of Children; of Children and Adults; of the Profession of Journalism; and of Educators.

If the present means of diagnosing and treating cancer were universally applied, at the earliest period, the actual incidence of cancer should be reduced from eighty to seventeen per cent, and the actual cure should be increased from ten to sixty per cent. The complete control of cancer rests upon research, which must discover a prevention or a cure.

Uncertain Origin.—The control of cancer, in the light of our present knowledge, is based upon the evidence that the great majority of malignant tumors are unicentric in origin—not that they necessarily arise in a single cell, but in a group

of cells in a single spot.

The majority view is that the cells in this single spot are not cancer cells. In a few instances the cells are displaced in embryonic life (part of Cohnheim's theory); but more frequently the group of cells in the single spot are normal cells of epithelial or connective-tissue origin, and differ, in no way which we are able to distinguish, from the surrounding cells. The change from the normal cell, or the cell of the Anlage (misplaced cell) to abnormal cell is brought about by some form of injury, called irritation, single or multiple, usually repeated over a long interval of time. The irritation may be of almost any form either physical or chemical.

We therefore consider a cancer to originate in a local group of cells, such as a congenital tumor—for example a pigmented mole; or a local group of normal cells changed by chronic irritation,—for example, a patch of leucoplakia, a wart, or a ulcer. These abnormal cells that were at first noncancerous, become cancerous.

As long as the lesion is noncancerous, it

should be curable, provided it can be completely removed and the part restored to normal,-for example the excision of an ulcer in a burn; or, provided the removal of the cause or causes will be followed by the restitution to normal in the abnormal area. This is clearly shown in leucoplakia in the mouth. If the irritating dirty teeth are smoothed and cleaned, and tobacco discontinued in all forms, with rare exceptions this white patch will disappear. In some instances the group of abnormal cells which are not cancer are more radiosensitive than the cells in which they are imbedded, and when radium or x-rays are applied, the abnormal cells are destroyed or return to normal. Many superficial epitheliomas not yet cancer are radiosensitive. Some subcutaneous and more deeply seated tumors disappear and do not reappear after radiation,—for example nerve-sheath tumors. The lesion in the cervix which precedes cancer, if removed or healed by operation or treatment, protects against cancer. Often a simple irritation of the nipple, if treated at once by cleanliness-soap and water and alcohol, and protection, vaselineheals, and the woman is protected from Paget's cancer of the nipple just as certainly as a woman nursing a child is protected from an abscess of the breast by keeping the nipple clean, or treating the irritated nipple properly at once.

Early Recognition. Whenever the noncancerous local area or spot is situated on the skin, or in the oral cavity, it should be recognized long before the cells change into cancer. For this reason proper education should make cancer of the skin and oral cavity preventable diseases.

If women who have borne children receive the proper attention after the birth of their

Summary of a lecture in the Friday afternoon series of the New York Academy of Medicine, January 10, 1930.

children and submit to periodic examinations, the noncancerous area of irritation should be discovered before the stage of cancer and the woman protected from cancer, just as periodic visits to a dentist should protect one from cancer of the mouth.

When the noncancerous local spot is beneath the skin and even deeper, in the soft parts or bone, the individual may not be aware of it until the cells become cancerous. But as a matter of fact, the seriousness of such a subcutaneous or deeper lump is due to delay on the part of the host who waits for pain or growth before seeking an examination. When every one learns to report to a doctor the moment a lump is felt, and doctors learn to recognize the lumps that should be completely removed, with and without preliminary radiation, the mortality from such cancerous tumors will be greatly reduced.

Even when the tumor is internal, it may give symptoms in its non-cancerous stage, and be recognized by proper diagnostic means in this stage,—for example, in the stomach, colon and rectum. The non-cancerous tumor which precedes the cancer may be an ulcer or a benign tumor, like a polypoid growth. These tumors should all be cured by removal or radiation. The encouraging evidence is that in recent years the actual per cent of recognition of such non-cancerous internal tumors is on the increase, and they are being recognized and removed before the cells have become cancer.

The moment the cells of the non-cancerous area become malignant, then the probability of dissemination of these cells through the blood or lymph vessels, is possible. The period of time of metastasis varies. In certain tumors, like the malignant mole, it seems to be almost instantaneous with the change from the abnormal into the cancer cell; while in the basalcell cancer metastasis rarely, if ever, takes place. We must always bear in mind that, if the local growth has become cancerous, its complete removal by operation, or its complete destruction after radiation, does not promise a cure in every instance.

When the great mass of people are instructed and influenced to seek periodic examinations, and the medical profession to make a diagnosis in this early stage, and to apply the appropriate treatment, the cancer mortality will be reduced, but not wiped out. Some cancers will be inaccessible, and many will never be recognized until metastasis has taken place. The only treatment we have today for disseminated cancer is radiation with x-rays or radium. Everything else so far has failed. The per cent of permanent cures of metastasis from cancer, or malignant

disease of multicentric origin, such as lymphosarcoma, is very small.

Treatment. It is essential for all of us dealing with cancer prevention to keep the following principles in mind: First, the avoidance of dangerous chronic irritants. The roentgenologists have discovered this.

Second, curing the abnormality of the noncancerous, local area, which may be done by the removal of the cause, the removal of the area, or radiation.

Third, treating the cancerous stage. We can never in this period be certain of a cure, even when the local area with involved glands is removed by surgery, or made to disappear by radiation.

There is a fourth group of cases in which the malignant disease, primary or recurrent, is inoperable, or there is metastasis, or the malignant disease is of multiple origin. Here we try radiation.

The educational problem is simple to understand, but so far it has been difficult of application, because we have been teaching the people of this country since 1913, and most authorities are of the opinion, that cancer is on the increase. A few interpret their records as showing definitely that cancer of the skin, the oral cavity, in the breast, and in other lumps, is on the decrease.

When we educate the people to come to the medical profession for periodic examination, or for an examination the moment they are suspicious of cancer, we encounter the problem of educating physicians to make a proper periodic examination, to learn how to diagnose the non-cancerous from the cancerous lesions, and to apply the appropriate treatment for each condition as it is discovered in the various parts of the body.

The Research Problem in the Control of Cancer: We must not be satisfied with the two treatments we have today,-surgery and radiation. There does not seem to be much room for improvement in the treatment by surgery, except that more surgeons should be taught the very best surgery in all its finer details. There is no doubt that the training of the surgeons in this country today shows vast improvement. There seems to be more room for improvement in radiation, whether with radium or x-rays. There is no doubt that many of the profession who are now employing one or the other, or both, have not learned the best methods. But there is even room for improvement in the technique of the most experienced.

Research for the practical benefit of the people today must go further along the lines of intravenous therapy, of which Blair Bell's intravenous lead is the most widely known,

257

or Raymond Pearl's studies which lead to the trial of tuberculin. There is also ample opportunity for further research in the treatment of human cancer and cancer in animals. whether transplanted or not; with the cultivation of normal and malignant cells from animal tumors and from human tumors, we will be given a larger opportunity to investi-

Then there is pure research looking for the cause of this change from the abnormal cell into the cancer cell with the object of discovering some preventive method, if cancer is not yet established, or some specific cure if the cancer cells are already established in their

gate other means of controlling the growth of

malignant growth.

cancer cells.

Number 5

Cancer as a World Problem. Any problem in science is a world problem. As cancer is fast approaching to be the most common cause of death throughout the civilized races, it is just as much a problem of one country as of another. The methods of cooperation in education and research in any international problem are already established. Cancer has been one that has only recently been studied in an international way, on a broader scope. In medicine, one never knows what member of a nationality, or what nationality, will furnish the discoverer of the cause and cure of disease. There is always some single individual or group who forge ahead in diagnosis and treatment; and with our method of communication today, there is no difficulty in disseminating this knowledge. We, however, need a better international organization for the control of cancer. World's Health, an international journal, and more frequent international congresses, will settle this question.

Cancer as a Public Health Problem. Recent events seem to show that cancer is being forced upon the health departments. They are rapidly taking up the educational phases. They are establishing diagnositic clinics. They are equipping cancer hospitals. They are building cancer research laboratories. They are buying radium for treatment. The chief difficulty here is to find a way in which the general medical profession can cooperate with the public health departments, for the most rapid advancement in the control of the disease through education, diagnosis, treatment and research.

Cancer as a Problem of the Dental and Medical Profession. It would seem that the dentists have the easier problem. Practically every lesion of the mouth can be felt with the finger, seen with the eye, or photographed with the x-rays. As the cause of cancer of the mouth is due to ragged, dirty teeth, illfitting plates, tobacco in any form, and there

is always first a non-cancerous lesion easily recognized, the dentist, when people are educated to come to him for periodic examination. should, with rare exceptions, find the local lesion in a stage in which it can be cured

by the removal of the causes.

With the medical profession it will be more difficult. There is first, the periodic examination. Let us take, for example, a lump in the breast. If every woman over twenty-five years of age reports the moment she feels that there is anything the matter with her breast, in at least eighty out of every hundred no operation will be necessary; perhaps fifteen per cent of these will be instructed how to keep the nipples clean. The great difficulty will be to distinguish between the lump that should be explored and the lump that is indefinite and need not be subjected to operation. Then comes the second difficult problem, that of the surgeon and the pathologist-to differentiate between the lump that is cancer and the lump that is not. In the examination of the cervix of the uterus we must decide whether there is any spot there that justifies an operation under gas or spinal anesthesia, during which a piece of tissue is removed for microscopic study. Here again we have the same problem as in the lump in the breast, and in addition to this, to choose which treatment is best for the patientnothing, operation, or radiation.

It is not necesary to go into all the difficult problems that are forced upon the medical profession when their patients come to them for periodic examinations, or report the moment they are warned. There is no doubt that the family physician will learn his growing important position. If the doctor of medicine is properly educated, he will be able to make the first examination thoroughly and decide on which patients he can take care of himself, and those who should be referred.

It seems to be an opinion, becoming more and more prominent and agreed upon by more and more members of the profession, that this patient first examined by the family physician, should be referred to a group of specialists rather than to a single specialist, so that he may have a thorough examination in spite of the fact that his family physician may have discovered a lesion difficult to diagnose, in a single spot.

This problem can only be settled when more and more people come for periodic examinations or very quickly after they are first warned.

In spite of my experience of thirty years, I have been observing in the past two years so many actually new lesions and new points of view of old problems that it is almost impossible

to keep up. The evidence is convincing that the people must be correctly informed in such a way that they will demand periodic examinations, or come after the first warning of any trouble. The danger of delay is far greater than the danger of seeking a periodic examination or early examination from a member of the medical profession who is incompetent, either to diagnose or correctly treat, and unwilling to refer the patient to anyone else.

Not until this movement of the great public to the medical profession for this earlier, or periodic examination, is general will we be in a position to solve the second problem of steering them to the members of the medical profession who will render them the best service.

The Problem of the Nursing Profession. There is no better time to educate the family and friends than when one of either group is ill, at home or in the hospital. Here is the opportunity for the nurse who comes in contact with both family and friends to present to them the correct information. We have evidence of the value of the nurse in a teaching function.

However, there is no question that neither the doctor nor the nurse, in the environment of home, office or hospital, and with either rich or poor, realize this great opportunity for presenting the inestimable value of consulting a doctor while you are well and the

moment you are warned.

Cancer As a Problem of the Social Worker. Undoubtedly, the demands on this group are at present greater than it is able to meet. Nevertheless they come in contact with a larger number of people who need teaching help for their protection against disease than either the graduate nurse or the dentist or doctor of medicine. This should be borne in mind when health departments or hospitals consider the budgets for the social service department and the number of workers required.

When you consider doctor, dentist, nurse, social worker,—and add to this, teachersthey all have the same opportunity for giving correct information in regard to the problems of good health and preventive medicine. But there is no uniformed organized system of instruction to help these groups any more than we have developed a proper system of education for the public. In spite of this we are making progress. The teachers in medical schools give least time to preventive medicine. This is emphasized by Warren in his Synopsis of the Practice of Preventive Medicine, in which various chapters are written by the faculty of the Harvard Medical School. Nevertheless the faculty has made a move in the right direction.

The Expectant Mother. Women who marry and bear children will ultimately be the best protected individuals in the community. During the expectant period two lives are at stake. In no other period of the life of a woman is the value of knowledge of health more necessary. When they are under the care of a properly equipped doctor of medicine, they learn the value of periodic examinations, of diet, and of paying attention at once to little things.

The Mothers of Children. The mother learns prevention the moment the child comes into the world, because drops are placed in its eyes to prevent infection and blindiness. She is introduced to the toxin-antitoxin for diphtheria, and all those things that every healthy child should have for its protection in the pre-school years. At this time every mother of children should be informed of the necessity of periodic examinations of herself and children. The most difficult problem for a mother today is mental hygiene for the children, and how to take care of their growing and inquiring minds before they enter school. It may be necessary for the state to provide for many of the children a supervision similar to that they receive after they enter the primary school, during this most important pre-school age.

Children. In the primary-school age, and in the primary school themselves, children should be taught not only the rules of conduct, but the rules of health. It should be the fourth "R" and should be given equal place with the three established "R's." Children can understand the necessity of first aid; of the antotoxin for lockjaw when they step on a rusty nail; of the care of the skin and oral hygiene; and of the danger of spitting. They can be taught that they will not fear to report immediately if they experience pain, or feel a lump, so that the necessary examinations can be made at once. They can be taught the details of a pain in the stomach,—likely appendicitis. When the rules of health are established in the primary schools, the problem of keeping these children further informed after they leave school is very much simplified.

Adults. The difficulty will be with women who have not had children and with all men. The risk of a woman who has not borne children of neglecting the periodic examination is small, but the risk of the men putting off an examination of the prostate until they are warned, or delaying after they are warned, is large. The majority of men use tobacco, and rarely take the same care of their teeth as women. All men who use tobacco and neglect their teeth, with few exceptions, are ignorant of this danger. Men, as they grow older, need

not only examination, but advice as to exercise and diet. The greatest protection today for men are the insurance examinations. It would be a wise thing for all insurance companies to insist upon re-examination at intervals of two years; and the insurance examination should be a much broader one.

The Problem for the Profession of Journalism. We can not expect much more of this profession until the dental, medical and nursing professions take up more seriously the ideas of preventive medicine. Then we will be in a better position to recommend to the journalists that the daily press is the best means of informing the people on rules of health, the necessity of preventive medicine; and not only of the new discoveries, but of their applications.

Educators. It is a question how much we should expect from the teachers of fundamental subjects in the primary schools in taking this extra burden of explaining the rules of health and preventive medicine. Better results may be obtained by one thoroughly trained teacher, talking to the primary schools of one locality, over the radio.

In the high schools, junior colleges, and

universities, there is practically no difficulty in having a definite department with one or more teachers to take care of this.

Conclusions. Knowing what we do today about the effect of education on the incidence and curability of cancer, and knowing that at present there is really very little educational effort and that only a small part of the public is informed, the first thing we should do is to establish, on a broad scale, the correct information of children in the primary schools and of adults throughout the country.

It is my opinion that we can agree today on what information is correct to give to children and to the public. This information should be given by individuals who are thoroughly conversant with the subject.

The next problem is the education of the profession in the more difficult diagnostic problems of examining people who think they are well, or have but recently been warned, and the equally difficult new demand of the treatment of the lesion in this much earlier stage.

The last problem is research. This must be speeded up. It would seem that the people themselves should tax themselves for this protection.

# BASAL METABOLISM IN DERMATOLOGICAL CONDITIONS\* By BINFORD THRONE, M.D., BROOKLYN, N. Y. Discussion By C. N. MYERS, Ph.D., BROOKLYN, N. Y.

From the New York Skin and Cancer Hospital.

E XAMINATION of the literature of Basal Metabolism shows that very little has been done in reference to Basal Metabolic Findings in dermatological conditions, although in all modern text-books on Skin Diseases, statements are constantly found of hyper and hypo-thyroid associations with various affections of the skin. This study was undertaken to determine if possible if any relationship existed between thyroid activity and the different skin diseases which are met with in a busy skin clinic.

Recently Falchi of Pavía reported a series of such observations. His conclusions were that his results did not permit of any definite conclusions, as they varied with the diseases, with the individual and with the particular conditions in which the skin happened to be. His series consisted of 14 cases of eczema, 9 of acne, 7 of psoriasis, 2 of leprosy, 2 of tuberculosis cutis, 14 of syphilis, 4 of scleroderma, 1 of pellagra, 1 of porokeratosis, 1 of erythrodermia, 1 of alopecia and 1 of Kaposi's sarcoma. Speracio of Rome in discussing Falchi's paper re-

ported his findings in 219 cases of skin disease in which he had determined the basal metabolism. He found it increased in 85 or in 35 per cent; decreased in 60 or in 27 per cent and normal in 74 or 34 per cent. He was unable to draw any definite conclusions but he believed that there is a relation between cutaneous affections and basal metabolism.

In our study the patients were either adults or they were in late adolescence. The difficulty of getting children into the perfect basal state was too great for the time at our disposal.

#### Acne

The onset of this condition usually at puberty has naturally brought under suspicion the activity of the sex glands; its frequent association with menstrual deficiencies has tended to strengthen this view. Dietel, however, stated after an examination of 60 of these cases with the interfereometer, that the internal secretion of these glands was decreased in only 10 per cent and that this decrease was slight and practically nil. In some cases he found an associated hypothyroid function. Hornung, in a study of 150 cases of functional ovarian dis-

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

turbance, found that the ovary did not exercise any direct influence on either the basal metabolism or on the specific dynamic action of food stuffs. Horry Jones also stated that loss of ovarian or testicular hormones causes changes in the body weight and that these changes are often associated with changes in total metabolism. Extracts of these glands when injected into the blood stream do not cause an increase in the oxygen intake.

Basal metabolism determinations were done on 109 cases of this disease. Of these patients 34 were males and 75 were females. For comparative purposes these cases were divided according to age and sex and showed the follow-

ing findings:

Age 14 to 20 years. Males giving a plus basal 11: Males with a minus 11. Females giving a plus basal 8: Females with a minus 16

At these age limits the percentage of males showing a plus basal to those showing a minus was equal. While with females the number showing a minus basal was twice as large as those showing a plus.

Age 20 to 25 years: Males showing a plus basal 6: Males with a minus 3. Females showing a plus basal 12: Females with a minus 22.

In this age group the number of males with a minus basal had decreased 50 per cent; while the females gave practically the same percentage of minus findings as did those in the earlier age group.

Age 25 to 30 years: Males with a plus basal 2: Females with a plus 7. Males with a minus basal 1: Females with a minus 5.

In this age group the percentage of males with a plus basal became proportionately greater, being twice as great as those showing a minus, while with the females those with a minus has become much smaller or representing now only 41 per cent of the total females in this group.

Age 30 to 35: Males none: Females showing a minus 1. Females showing a plus 5.

The change from a minus to a positive in this age group has become even more marked, the percentage of minus being only 20 per cent of the total.

Age at the development of the disease was investigated in 24 females and in 9 males. The findings were identical as those given above. Blood chemistry examinations for chlorides, sugar, urea nitrogen and uric acid showed no constant relation to the basal findings. The type of the disease also seemed to have no bearing on the basal findings. Ramel's findings of an apparent tubercular association with cases of Acne Indurata may have some bearing on the low basal findings in this disease. Complement fixation test for tuberculosis was posi-

tive in about 60 per cent of the cases which we investigated. However, we have not yet done enough of this work to justify any conclusions.

# Erythema Group

Erythema Toxicum: Eight cases of this type were examined. All were females. Their age groups and basal findings were as follows:

Under 25 years none.

Between 25 and 35, one case; basal minus.

Between 35 and 45, five cases; basal plus in four and minus in one.

Age 45 and over, two cases; both showed a

plus basal.

The basal findings in this group were within normal limits except in one case which gave a slightly increased reading.

In five of these cases blood chemistry showed a nitrogen retention and three of them showed a moderate hyperglycemia.

Erythema Multiforme: Six patients were ex-

amined, one male and five females.

Under 25 years: one female, basal plus.

Between 25 and 35: none.

Between 35 and 45, two females: basal minus in both.

Between 35 and 45, two cases, one male and one female; basal plus in both.

Over 45, one female, basal plus.

All basal findings were within normal limits except in the female over 45 years. She had been operated for exophthalmic goitre some years ago, with partial removal of the thyroid. Her basal was plus 16. Her blood chemistry was normal. Blood chemistry examination was done in 3 others, one was normal, one showed a urea nitrogen above normal and a moderate hyperglycemia, the other showed only a moderate hyperglycemia.

Erythema Pernio: Three cases:

Under 20 years, one male; basal plus: one female, basal minus.

Between 20 and 25; one female, basal plus. Erythema Nodosum: Two cases, both females, both about 35 years of age and both gave a minus basal within normal limits. Blood chemistry in both was negative.

Erythema Induratum: One case a female aged 34, her basal findings were minus 0.4. Her blood chemistry showed a low urea nitrogen, 6.87 in 100 cc. of blood, otherwise it was

normal.

### Pruritus

In this group where the only complaint was pruritus (there were no visible skin lesions) there were eight patients.

Under 20 years one male basal minus.

Between 20 and 25, two females: basal minus in both;

Over 45: one male, basal plus; four females. basal plus in three and minus in one.

The blood findings in these were as follows: increased urea nitrogen in five, increased uric acid in two, hyperglycemia, moderate in three; none were definitely diabetic.

The basal findings in this group were within normal limits, except in one case where it showed a very slightly increased rate, plus

12.9.

### Urticaria

Nine patients suffering with this condition were examined. In all the condition was chronic. On account of the supposed relationship of this condition to the vegetative nervous system, and on account of the marked variations of the findings in the individual cases, it was thought best to give the findings in detail:

Under twenty-five and over twenty years of

M. C., female. Basal plus 2.9.

M. F., female. Basal minus 7.3. This patient showed an enlarged thyroid; she was 22 years of age, had been suffering from the condition for five years: had been given thyroid medication at the age of fifteen.

E. M., female. Basal 10/29/28 minus 27.

Basal 2/11/29 minus 15.6.

I. H., male, aged 33, basal plus 11. J. H., female, aged 36, basal plus 38.

C. Y., female, aged 37, basal minus 2.

J. DeM., female, aged 46, basal minus 4.

E. G., female, aged 56, basal minus 13.4. S. L., female, aged 45, basal plus 16.2.

Dividing these cases according to age limits we find:

Between 20 and 25 years two females, one showing a plus and one a minus basal.

Between 25 and 35 years one male, basal

Between 35 and 45 years two females, one with a minus and one with a plus basal.

Over 45, one male basal plus; three females; one with a plus and two with a minus basal.

Of these nine cases, five showed a basal metabolic finding within normal limits. In one it was markedly elevated and in one only slightly elevated, while two showed a minus below the lower level.

The blood chemical findings in six of these (blood chemistry was not done in the others) showed marked disturbances in general metab-Five showed hyperglycemia, the uric acid findings were normal in three cases but were elevated in the other three. The urea nitrogen was decreased in two but was markedly clevated in the other four.

### **Psoriasis**

Of this condition 25 patients were examined, six males and nineteen females. They were of the following :

Below twenty years:

Males 1 basal minus. Females 2 basal minus. Females 1 basal plus.

20 to 25 years:

Females 2 basal minus Males none. Females 2 basal plus.

25 to 30 years:

Males 1 basal minus, Females 2 basal minus.

30 to 35 years:

Males 2 basal plus. Females 3 basal plus.

35 to 40 years:

Males none. Females 3 basal plus. Females 1 basal minus.

Over 40 years:

Males I basal plus. Females 2 basal plus. Males 1 basal minus. Females 1 basal minus. The blood chemistry of this group was as

follows: In the group under 20 years one case showed a moderate hyperglycemia. In the 20 to 25 year group, one showed a moderate hyperglycemia and one with an excessively high basal (plus 23), showed a very unstable metabolism with marked variations in the blood sugar and in the urea nitrogen. There were, however, no signs of nitrogen retention. In the 25 to 30 year group one case showed a moderate nitrogen retention. In the 30 to 35 year group, one case showed a moderate nitrogen retention and one other showed a urea nitrogen below normal. In the 35 to 40 year group, one case showed our socalled "arsenic blood picture" and one other showed a subnormal urea nitrogen. In the group over 40 years, two cases showed the arsenic picture and one other a moderate hyperglycemia. A summary of the basal metabolic findings in these cases of Psoriasis shows four findings above plus 10 and one below minus 10.

Sycosis Vulgaris: Eight cases in all of this condition were examined, all of course were males.

Between 20 and 25 years, 2 cases gave a plus basal; I case gave a minus basal.

Between 25 and 30 years, 1 case, basal plus. Between 30 and 36 years, 2 cases, basal plus: 2 cases, basal minus.

Blood chemistry on this group showed uniformly a moderate hyperglycemia.

The basal findings in one case were above plus 10, and in one case it was below minus 10. Infectious eczematoid dermatitis. Seborrhoeic Dermatitis plus bacterial infection. Seven cases.

Below 20 years, 1 female, basal minus. Between 20 and 25, 1 female, basal plus. Between 25 and 35, 1 male, basal minus; 2 males, basal plus.

Between 35 and 45, 1 female, basal plus.

The blood chemistry in these cases was comparable to that in the sycosis group.

Lupus Erythematosus. Five cases. Age 30 years, female, basal plus 15. Age 49 years, female, basal plus 25.9.

Age 58 years, female, basal plus 13.4.

Age ?, male, basal minus 8.2. Age ?, female, basal plus 42.8.

Blood chemistry in this group was without significance except that the CO<sub>2</sub> combining power has a tendency to be lowered. The serum calcium done in some of these patients was within normal limits.

Bromoderma. One case of this condition was seen, a woman aged 24 years, her basal findings were normal, plus 3.3.

Leucoderma or Vitiligo. Six cases.

Under 20 years: Male 1, basal minus; 1 female, basal plus.

Between 20 and 25 years. Male 1, basal plus. Between 25 and 35: Male 1, basal plus; female 1, basal plus.

Over 35: Male 1, basal plus.

The blood findings in this group were essentially negative in most cases, in one it gave a definite arsenical picture.

One case, a female with a high plus, was given a suprarhenal preparation, about 10 days later her basal showed a reduction of 8.4 points.

Of these six patients, four showed a basal above normal, two gave normal findings and in none was it below normal.

Leuconychia: One case, a man, aged 58, gave a very high plus basal. His blood picture was typical of arsenic retention.

Bromoderma: One case, a female, aged 24,

basal plus within normal limits.

Blood findings without significance.

Scleroderma: Longcope reported that in three cases of this condition he found a lowered basal metabolic rate. Pardo-Castello on the other hand reported one case with a high plus rate. Our results were as follows:

Number of cases, six.

25 to 35 years: 1 male plus.

35 to 45 years: 1 male plus; 1 female plus. Over 45 years: 1 male plus; 1 female plus; 1 female minus.

Out of six cases all were plus except one, a female and she showed a minus within normal limits.

The blood findings in this condition were such as we have previously reported. One case showed arsenic in pathological amounts in his urine. This examination was not done on the others.

Acrodermatitis Chronica Atrophicans: Two cases of this condition were examined:

Female, aged 34 years, duration of the condition three years. Basal plus 18.5.

Female, aged 35 years, duration of the condition four years. Basal plus 29.25.

The blood findings in these two were without significance, each showed a moderate hyperglycemia. Generalized Erythroderma.

One case a man aged 51 years, duration of the condition about one year.

Basal metabolic determinations were as follows:—

12/ 5/28	plus	38.3
1/24/29	plus	0.7
2/15/29	plus	23.9
2/27/29	plus	32.1
3/28/29	plus	25.9

The first basal taken 12/3.28 was not considered.

Morvan's Disease: -

One case, a woman aged 60 years. Blood findings only a moderate nitrogen retention.

Basal plus 26.9.

Pemphigus ;-

One case of pemphigus Foliaceous a female 30 years of age, duration of the condition two and a half years. Six basal determinations were done, they varied from plus 22.1 to plus 50.9.

Two cases of pemphigus vulgaris both males of middle age were examined and both a plus basal, one showing a plus 15.6 and the other a plus 55.8.

Alopecia Areata. Levy-Franckel and others reported a series of cases who had not received endocrine treatment. One with an associated Basedow's disease with a basal of plus 56%; seven others with a plus basal above the normal level and one with a normal basal.

In this series we examined 69 cases. Their age groups and findings were as follows:

From 6 to 13 years:

Males, basal plus 4 cases. Males, basal minus 1 case. Females, basal plus 2 cases.

From 13 to 20 years:

Males basal plus 6 cases. Males, basal minus 1 case. Females, basal plus none. Females, basal minus 4 cases.

From 20 to 25 years:

Males, basal plus 3 cases. Males, basal minus 4 cases. Females, basal plus 1 case. Females, basal minus 1 case.

From 25 to 35 years:

Males, basal plus 10 cases. Males, basal minus 7 cases. Females, basal plus 2 cases. Females, basal minus 8 cases. From 35 to 45 years:

Males, basal plus 1 case. Males, basal minus 5 cases. Females, basal plus 4 cases.

Over 45 years:

Males, basal plus 3 cases.
Males, basal minus 1 case.
Females, basal plus 1 case.
Females, basal minus 1 case.

Blood chemistry in this group frequently showed an arsenic picture. Urine examination in 20 of this group showed arsenic in pathological amounts in 75%. Dr. Herman Feit, who is associated with us at the New York Skin and Cancer Hospital is working on this element of the condition and will publish his results in the near future. It might however be stated here that a case of total alopecia which had resisted all kinds of treatment, regained his hair when arsenic eliminative treatment was added to his previous therapy.

#### Lues

Age group 24 to 30 years: Males 2 basal plus. Females 1 basal plus.

Age group 30 to 35 years:

Males I basal plus. Females I basal plus. Females I basal minus.

Age group 35 to 45 years:
Males 4 basal plus. Females 6 basal plus.
Males 2 basal minus.

Age group 45 years and over:

Males 4 basal plus. Females 5 basal plus. Males 2 basal minus. Females 1 basal minus. Blood chemistry was done on six of these

patients:

One case aged 44 years had 7 such examinations his urea nitrogen was above normal on three analyses and normal four times. His uric acid in all the determinations was between 3½ and 4.

A case aged 35, a woman had 9 blood chemistries. Urea nitrogen was normal three times, above normal once and below normal five

The other cases gave similar findings.

A summary of the above shows 15 males 11 of whom had a plus basal; 4 of whom had a minus basal. 15 females 13 of whom had a plus basal: 2 of whom had a minus basal.

An examination of the basal reports in addition to this 24 to 6 ratio in favor of the plus; that the plus was markedly elevated in nine cases, while the minus was below the lower normal only twice and at that the lowest basal finding was—13 while on the contrary the highest plus was 39.9.

#### Eczema

We examined 20 males and 30 females suffering with this disease. Their findings were as follows: Under 20 years:

Males 2 cases, basal minus. Females 1 case basal plus. Females 2 cases basal minus.

From 20 to 25 years:

Males 1 case, basal plus. Females 2 cases basal plus. Females 1 case basal minus. From 25 to 35 years:

Males 2 cases plus.
Males 2 cases minus.
From 35 to 45 years:
From 35 to 45 years:

Males 1 case plus.
Males 3 cases minus.
From 45 to 55 years:

From 45 to 55 years: Males 3 cases plus.

From 55 to 65 years: Males 4 cases minus.

Females 8 cases plus. Females 2 cases minus. Females 2 cases minus. Females 1 case minus.

Females 5 cases plus.

Females 2 cases minus.

From 65 to 75 years:

Males 2 cases minus. Females 2 cases plus. The blood chemistry findings in eczema were the same as we have reported in previous communications. A summary of the basal metabolic findings in this disease were as follows:

In all age groups below 35 years the findings were within normal limits except for two females who showed respectively basals of

plus 25.7 and plus 17.

In the 35 to 45 years group one female showed a basal of plus 28 2 and another female

showed a minus of 16.5.

In the 45 to 75 year group the males showed a practically normal basal with a ratio of 6 with a minus to 3 with plus basal; with the females on the other hand 11 gave a plus to 4 minus. This may have been due to the loss of ovarian secretion at this age. One of these was definitely exophthalmic. Of the total 50 cases 17 showed abnormal basal metabolic findings.

### SUMMARY

In this study 340 patients were examined; 139 of these were males and 201 were females. They were divided according to sex and disease as follows:

Acne	Males 34	Females 75
Alopecia Areata	Males 40	Females 24 Females 2
Bromoderma	Males 20	Females 1 Females 30
Erythema Induratum		Females 1
Erythema Pernio Erythema Toxicum	Males 1	Females 2 Females 8
Erythroderma	Males 1	
Infectious Eczematoid Derm. Leuconychia	Males 3 Males 1	Females 4
Lupus Erythematosus Morvan's Disease	Males 1	Females 4
Pruritus	Males 2	Females 6
Psoriasis Pemphigus	Males 6 Males 2	Females 9 Females 1
Scieroderma	Males 3	Females 3
Sycosis Vulgaris	Males 8 Males 15	Females 15

Urticaria . . . . . Males 1 Vitiligo . . . . Males 4 Females 8 Females 2

In the erythema group there were no marked variations in the basal metabolic findings. In pruritus the same results were found. Psoriasis showed 20 per cent abnormal basal findings. In Alopecia Areata 14 cases showed a high basal and 10 a low. In conditions associated with pus formation such as sycosis vulgaris and infectious eczematoid dermatitis the basal findings were practically negative.

In lupus erythematosus 80 per cent of the patients showed a very high plus basal.

Vitiligo showed the same tendency to high findings; of the four cases, of this condition examined, all showed a high plus. In sclero-

derma all cases examined showed a plus basal but not necessarily above normal.

The one case of Morvan's disease examined gave a high plus. In the case of generalised erythroderma the high basal findings were parallel with the blood chemistry examinations, which showed marked disturbance of the general metabolism.

In pemphigus all cases showed abnormal

high findings.

In syphilis 11 of 30 cases showed abnormal findings; 9 of these 11 were above plus 10, in some instances they were more than plus 30, In only two cases of this disease were the findings below the normal level.

The indications for treatment as shown by basal metabolic findings we have not yet ascertained. A few patients were given endocrine preparations, some seem to have been helped while in others apparently no results were obtained.

We believe, however, that this work deserves to be continued. The results up to date are promising.

### DISCUSSION

By C. N. Myers:—The scope of basal metabolism in skin diseases is broad and practical in that it offers a scientific measure of the whole process of the utilization of food except the mechanism of digestion and absorption. All dermatologists at one time or another have empirically prescribed glandular therapy; they have also attempted to differentiate between hypothyroidism and hyperthyroidism. On the

basis of more than 1000 basal observations it has been shown that this cannot be done with any systematic degree of regularity. Before discussing the results presented in the paper by Dr. Throne, a few remarks dealing with the basic principles might be opportune. Higher organisms are able to do work anaerobically for a short time, but in the main they derive their energy solely from oxidation. By measuring the oxygen consumed and the carbon dioxide evolved the respiratory quotient may be calculated. This is based upon a fundamental law-Avogadro's-which states that equal volumes of all gases contain the same number of molecules, or that equal number of molecules occupy the same volumes. The three classes of foodstuffs differ in the rate at which they become available. Sugar is most promptly oxidized after ingestion and one molecule of oxygen is consumed for each molecule of carbon dioxide evolved. For example glucose is utilized as follows:

$$R.Q. = \frac{C_6H_{12}O_6 + 6O_2 = 6H_2O + 6CO_2}{6 \text{ mol. } O_2} = \frac{6 \text{ vol. } CO_2}{6 \text{ vol. } O_2} = 1$$

With fats and proteins there is a greater initial lag and the reaction for tripalmitin a representative fat is:

$$\frac{\text{C}_{51} \text{ H}_{98}\text{O}_6 + 72.50_2 = 51\text{CO}_2 + 49\text{H}_2\text{O}}{51 \text{ mol. CO}_2} = \frac{51 \text{ vol. CO}_2}{72.5 \text{ mol. O}_2} = 0.703$$

The chemical equation applied for the oxidation of protein is more complex but by experimental observation it has been found to yield a R. Q. of 0.8016. These values are mentioned as they are closely related to products directly concerned in cutaneous manifestations. The monumental work of Benedict of Boston has given adequate consideration to the variable factors.

In exophthalmic goitre, the storage of glycogen has been the subject of much investigation, and the tolerance for sugar is diminished. In diabetes Du Bois concludes that there is no defect in oxidation but an abnormality in the mobilization. In muscular contraction glycogen is transformed by way of the hexose phosphate into lactic acid, a process in which no oxygen is required. Hill, Long and Lupton have aptly compared the reverse process of the restoration of lactic acid to glycogen to the recharging of an accumulator in which the dynamo supplies the energy to effect restoration.

During the past four years the research de-partment of the New York Skin & Cancer Hospital has been concerned with the physiological abnormalities observed in the blood of various groups of patients. These groups of patients have shown marked deviations from the normal either in respect to chlorides, sugars, urea, uric acid, carbon dioxide, cholesterol, calcium or as combinations of the substances. It has not been our purpose to discuss these normal values but to submit data, showing the general trend of these patients by age intervals and sex. The exhaustive study of Clark of the U. S. Public Health Service on thyroid enlargement in girls of school age is interesting in relation to the observations of Dr. Throne in the results on acne. The results on acne show that in the adolescent stage there is a marked difference between male and female. These results are interpreted in terms of the trend of the basal rate and not in terms of the textbook normal. Our experience with textbook normals is that they mean little. Up to the age of 20 among boys acne cases have a ratio of 1:1 as far as the positive and negative are concerned. In females the ratio is 2:1 negative. The number of patients in the group was 50, so that a fair conclusion may be obtained. In the group 20-25 years of age there are more than 50 patients and the ratio for males is 2:1 positive and females still 2:1 negative. This is indicative of a marked difference between the adjustment of the ability to absorb and use foods in male and female. Furthermore this process lags in females as shown by the 2:1 ratio that exists up to the age of 25. At ages 25-30 males show a ratio of 2:1 positive and females 7:5 positive.

It is also important to point out that in psoriasis no definite conclusions can be drawn notwithstanding the fact that earlier investigators have looked upon psoriasis as a condition asso-

ciated with a hypothyroidism.

It has been considered that at least 50 per cent of cases suffering with urticaria have a hypothyroidism. The basal metabolism tests carried out in this investigation have not substantiated these findings.

The results obtained in cases of pruritus are very much the same as the findings in urti-

caria

In mycotic diseases the basal metabolisms thus far have been without particular significance. It is important, however, that a continuation of these studies be made so that the classification by age and sex and the duration of the disease, will undoubtedly bring forward a more conclusive \*tatement in regard to these last three conditions.

In the so-called bullous diseases pemphigus foliaceus and pemphigus vulgaris show a very

high plus basal.

Giuseppe Beraccini. Concerning the Importance of Endocrine and Nervous Lesions in the Etiology and Pathogenesis of Pemphigus, Arch, Ital. di Derm. Sifil, e. Ven., Vol. III, fasc. IV, Avril, 1928.

Dermatitis herpetiformis also shows a high plus basal and it seems from this that this group of diseases shows a very marked tendency for the utilization of food elements ingested. It will be noted that this confirms the 11 reports on patients by Dr. Carl Klepper, Arch. für Derm, und Syph, 153 Band 1 Heft page 6. The basal metabolism in 7 out of 9 cases was elevated more than 10 per cent.

It is my impression that the thyroid alone is not the only endocrine gland which must be considered and furthermore our results seem to indicate that there is a combination of circumstances involved in the metabolism of car-

bohydrates, fats and proteins.

These studies will be continued on several more thousand patients so that a more definite estimate may be obtained as to the distribution of these hypo and hyper values noted in various groups of patients.

In scleroderma cases there has been a tend-

ency toward a hyper value for the basal tests. It is particularly important to refer to the investigations on the basal metabolism in treated cases of syphilis. Syphilis, which involves a large part of dermatological practice, shows that most of these patients with tertiary lesions have a marked tendency toward the hyperthyroid state. The number examined was 15 males and 15 females. The total number that was plus was 10 males and 13 females. Of the 15 females, 13 had a plus and 2 had a minus. Of the 15 males, 11 had a plus and 4 had a minus. The highest plus was 39.9; the lowest was-13. The plus was markedly elevated in 9 cases-above normal in 9 cases and it was below the lower level in only 2.

In alopecia areata 46 males and 23 females were examined. The highest basal was found in a female age 25. She showed a +69. On repeating the test after 8 days the basal was 26.8. Another test after 12 days was +29.5. The lowest found was—21.2. This patient was a man, age 40. A basal rate higher than +10 was found in 17 cases. Ten showed a

basal rate of less than—10.

A group of miscellaneous cases was examined with diagnosis of hyper and hypothyroidism. These results were as follows: Of 5 cases diagnosed hyperthyroidism, 2 showed a plus basal, 3 showed a minus basal. Of 12 cases diagnosed hypothyroidism, 7 showed a plus basal and 5 showed a minus basal. In other words the clinical diagnosis of either hypo or hyper thyroidism was wrong in more than 50 per cent of the patients. From this it can be seen that such a diagnosis can only be made correctly by a laboratory test. These cases were examined both by dermatologists and internists.

THE IMPORTANCE OF EXTRASYSTOLIC ARRHYTHMIAS IN YOUNG ADULTS\* By LOUIS FAUGERES BISHOP, M.D. and LOUIS FAUGERES BISHOP, Jr., M.D., NEW YORK, N. Y.

HERE is no more interesting kind of irregularity of the heart than that which consists of an extrasystolic arrhythmia. It is interesting because the skipped beat is that which we first come in contact with when we begin to feel the pulse as medical students. It is the irregularity that we most frequently meet with and which we are all almost certain to observe in ourselves sometime during our lives. At the same time it is an irregularity which is most grave in its significance in certain conditions and nearly as harmless as any irregularity can be in other conditions.

An epoch making advance in clinical medicine is marked by the time when physicians recognized that the skipped beat was not a skipped beat at all but evidence of a premature contraction. It may be said that this was the first cardiological idea that reached the minds of intelligent physicians in the dissemination of the knowledge of modern cardiol-Our theme today is the study of this irregularity in young adults, and this reminds me of an amusing incident that happened to me in Japan which illustrates the world wide impression that the heart specialist is too often considered as chiefly interested in cardiac failure while the fact is our most thrilling work is in the service we are able to render to the young.

I have just returned from a tour around the world and while in Tokio, Japan, I attended a meeting of the Rotary Club. The Rotary Club is an international vocational society and when one visits a foreign club, on being introduced one is expected to mention one's vocation. I announced myself as a heart specialist and had occasion to refer to the nature of my work and its relation to the prolongation of life. This Tokio Club was composed of some of the brightest and most influential men in Japan. It was a gay and interesting meeting, though conducted mostly in Japanese lan-The next person to be introduced was a Rotarian from another country, who said his vocation was a child specialist. He said his work was different. Dr. Bishop's job was to say "good bye" to people when they left the world and that his job was to say "how do you do" when they came into it.

Unfortunately, this conception of the work of the cardiologist is too prevalent and it is pleasant to emphasize on this occasion the work that we do in giving valuable service in the cardiac neurosis of young people.

Many disturbances of the heart beat give

normal P R and T waves, although the interval between these waves may have been lengthened or shortened. In other words, the heart muscle is to all appearances, normal, and the disturbances rested with the conduction system. The parts of the telegraph system which send and receive messages are in excellent working order and capable of transmitting correct messages but the wires are damaged and cannot function properly.

Let us now see what happens when the conduction system remains intact but the heart muscle itself does not function correctly. The auricle may be considered first. In other irregularities the auricle contracts in a normal manner in response to stimuli received from the normal pace-maker. records itself by a deflection of the electrocardiogram forming a natural P wave, but it occasionally happens that an impulse may arise elsewhere in the auricle than at the pacemaker. Some point has become over-irritable and momentarily supersedes the influence of the pace-maker. When this happens a distorted P wave is found instead of a normal one. Such an impulse travels down as well as up through the auricle to the connecting bundle and finally causes contraction of the ventricle. The ventricle, being undamaged, cares little where the impulse came from and does its duty by contracting but not at the proper time.

It is as if someone tapped in on a telegraph wire and sent a message. The recording instrument at the other end responds with its usual clicks and does not distinguish whence the message came. The R-T or ventricular complex will thus be a normal one.

We, therefore, can distinguish between what are known as "premature contractions" of the auricle and normal ones. They are called "premature" because they come between two normal beats and therefore appear before the second normal beat. In order to illustrate this point further, consider that the heart is beating at a normal rate of about eighty per minute. Each P-R-T complex will be equally spaced from every other and all will have a perfectly similar shape. A queer looking complex is suddenly thrown in and on examination it is found there is nothing wrong with the R-T part of the complex but the P wave is either upside down or taller or perhaps wider than the other P waves. This finding spells "auricular premature contractions," otherwise known as "auricular extrasystoles."

If the irritation which causes these contractions is of longer duration there may be two

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

or three more extrasystoles following each other in sequence and then return to normal rhythm. It must be remembered that while these contractions are going forward, normal impulses are coming from the pace-maker. These, being absorbed in the abnormal complexes, however, become lost.

The ventricle may beat out of time in the same manner as the auricle. In this case there is nothing the matter with the auricle. There has been, however, a point of irritation set up somewhere in the ventricular wall which has started independent contractions, and since these have not occurred through normal paths, their records will be abnormal. Such records will consist of badly distorted R-T waves, the amount of distortion depending on how far the point of irritation less from the normal pathway. These deformities may be extreme and may dip down below the line to a considerable extent or they may go high above the line. Sometimes they are both above and below the line in the electrocardiogram.

In ventricular extrasystoles one usually has to deal with a decided disturbance in rhythm due to what is known as the "compensatory pause." The meaning of this term is simply that when the ventricle is stimulated too soon after a contraction it will not respond to the stimulus so it waits for the next stimulus from the auricle.

Picture again a regular heart rate with normal evenly spaced and similarly shaped P-R-T complexes. A bizarre shaped wave is suddenly found to be thrown in. There is an absence of a P wave and on measuring the width of the interval it is discovered that it is shorter than any normal preceding one, indicating that the R-T complex comes from the ventricle. Meanwhile, normal P waves are occurring and when one of these falls on such an abnormal complex it finds that the ventricle has already contracted and is therefore unable to respond. There is then a pause where nothing happens until the next P wave occurs. This is the "compensatory pause" mentioned above.

There may be several ventricular contractions following each other just as there may be many auricular contractions in auricular extrasystoles. There is a series of weird waves of various shapes here also, but whereas in the first instance they were followed by normal R-T complexes in this case they consist of abnormal R-T complexes.

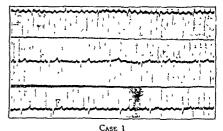

Of course, there may be many variations in extrasystoles. For example, there may be both auricular and ventricular extrasystoles, both starting from different foci, thus giving a series of variously shaped waves, or again there may even be extrasystoles beginning in the con-

necting bundle between the auricle and the ventricle. Although these may for the moment complicate the picture, they can be readily understood by a brief study of the electrocardiograms.

With the exception of sinus arrhythmua, auricular and ventricular extrasystoles are the most frequent forms of irregularities of the heart beat. They are most often found in cases of long standing myocarditis, although they may occur at any age indicating a temporary derangement of the heart function. Their presence need be no cause for alarm as they, themselves, rarely embarrass, but they should always be considered as a reason for a careful search for underlying damage.

To illustrate certain features of extrasystolic arrhythmias in young adults I have included the following three cases:

Case 1—I. H. F. O., girl, age 17. Occupation school. Chief complaint none. No previous illnesses excepting chicken pox when nine or ten years of age No history of rheumatic fever or chorea. About two months ago was ill with influenza At this time her family physician noted that she was cyanotic and had an irregular pulse She was given no medicine for her heart but was kept in bed. Has had tonsillitis about every year Personal history—sleeps well, appetite good, bowels regular. Menstrual history somewhat irregular.

I. H. F. O. Electrocardiogram illustrating an auricular extrasystole in lead II.

Physical examination—Tall, thin girl, moderately cyanotic, Weight 117 pounds. Eyes react to light and accommodation. Eye grounds normal. Teeth in good condition. Tonsils not visible. The lungs were clear and there was no apparent enlargement of the heart. The rhythm was markedly irregular due to extrasystoles "Rate 60. Blood Pressure 80/50. There were no abdominal abnormalities and the vaginal examination was negative Reflexes by peractive

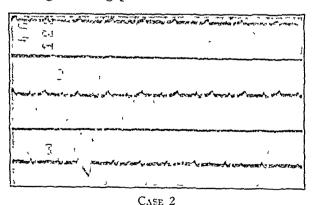

The Orthodiagram showed normal configuration of the heart shadow. Electrocardiogram

taken on January 9th—rate 60—showed sinus arrhythmia and auricular extrasystoles. The Red Blood Count was 4,120,000 and the White Blood Count 6,200. Haemoglobin 72%. Differential Blood Count—Lymphocytes 40. Polynuclears 57. Mono-nuclears 3. Wassermann negative.

Course and treatment—General hygiene, high caloric diet, consisting principally of milk. She was given Quinidine, two grains after meals three times a day. On January 22nd had gained three and a half pounds, feeling a great deal better and is leading a more sensible life with less work. One month later further improvement was noted in her general condition. Resumed her normal life.

Comment: This case illustrates extrasytoles of no clinical importance except as a result of generalized neurasthenia apparently due to extreme overwork in the school. With general hygiene and regular modes of life the extrasystoles entirely disappeared. They were part only of her general condition and in no way indicated any cardiac impairment.

Case 2—I. H. L. H., male, age 20. Occupation student. Chief complaint none. Previous illnesses—Has had measles, mumps, diphtheria, and pneumonia at seven years of age. Influenza in 1918. No rheumatism or chorea. Has attacks of tonsillitis occasionally. He was refused admission to West Point due to the fact that he had an irregular heart and he, therefore, went to his family physician who also confirmed this fact. He sleeps well, appetite is good and bowels are regular. He takes coffee in moderation, no tobacco and he has always been athletic (track). Has lost few pounds in weight during past month.

1 H L H Electrocardiogram illustrating a ventricular cytrasystole in lead III, followed by a compensatory pause.

Physical examination—Well nourished and developed boy. Eyes react to light and accommodation. Teeth in good condition. Tonsils moderately enlarged and appear infected. Small mass of adenoids in the nasal pharynx. Dis-

charge from both sphenoids, particularly the left. The other sinuses appear to be negative. No abnormal pulsations or apparent enlargement of the heart—rate 80. Regular, normal response to exercise. Numerous extrasystoles after exercise; not present after heart had slowed to its usual rate. Blood pressure 120/60. No significant abdominal findings. Extremities normal.

The orthodiagram showed a heart of normal size and shape and the electrocardiogram showed sinus arrhythmia and one ventricular extrasystole in lead two. Red Blood Count 4,490,000, White Blood Count 5,600. Haemoglobin 80%. Differential Blood Count, Lymphocytes 45, Polynuclears 55. Blood Chemistry, N. P. N. 58. Blood Sugar 148. Uric Acid 3. Creatinine 1. Urinalysis on December 29th and December 31st were entirely negative. Wassermann was also negative.

Course and treatment: Tonsillectomy. Quinidine, grain two, three times a day after meals.

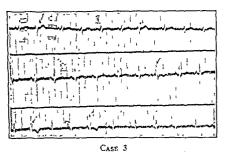

Comment: This boy was placed on Quinidine. grains two, three times a day. Tonsillectomy was done. After a few months, as far as he could notice, the extra beats were very much less frequent and later he passed a physical examination successfully and was admitted to West Point.

Case 3—I. H. D. L., girl, age 21. Occupation student. Chief complaint none. Was examined for her heart because of irregularity discovered by her family physician, who ordered her to take a complete rest and no exercise. On account of this rather severe treatment she wished further opinion. Has had measles, mumps, scarlet fever at four years of age, and many attacks of tonsillitis. Tonsillectomy in 1920. She has had no loss of weight (110). Sleeps well, appetite good and bowels are regular. Menstrual periods also regular. Smokes moderately, coffee in moderation. Takes no medicine. She has no symptoms referable to her heart and would not have sought advice in regard to it had an irregularity not been noticed by Life Insurance examiners and confirmed by her family physician.

Physical examination—Well developed and nourished young woman, weighing 110. Marked myopia and astigmatism. Nothing significant noted in head and neck. No abnormal pulsations of heart and no increase in size made out by percussion. Rate 80. Marked arrhythmia, thought to be auricular fibrillation. No murmurs. No abnormal findings. Reflexes active.

The orthodiagram showed no abnormal enlargement of the heart in any diameter. The electrocardiogram showed marked sinus arrhythmia associated with very numerous extrasystoles. (This finding was very difficult to tell from auricular fibrillation, clinically). Red Blood Count was 4,150,000, White Blood Count, 11,950. Haemoglobin 70%. Differential Blood Count, Lymphocytes 30, Polynuclears 68, Eosinophiles 2. Urinalysis gave no positive findings.

Course and treatment: This patient was placed on Quinidine which in no way altered the rhythm of her heart. She was advised to lead a regular life and to get out of doors and take a moderate amount of exercise. She was also placed on a tonic and smoking and tobacco were restricted. Six months later there was no appreciable change in the condition of her arrhythmia but in every way the girl appears to be normal, healthy and happy.

I. H. D. L. Electrocardiogram illustrating numerous ventruedar extrasystoles in leads I, II, and III, elimically resembling the pulse of fibrillation

Comment: This is a very interesting example of a person with a totally irregular heart due to very numerous extrasystoles, which no doubt would have placed her in the invalid class had not the nature of her trouble been recorded by the electrocardiograph. Where extrasystoles are as numerous as they were in this case it is difficult to say whether they are entirely of an innocent nature and I believe this girl should be watched very carefully over a period of years. But I do not believe she should be invalidized.

It must be confessed that there is very little in the electrocardiogram to determine the importance of extrasystoles in young adults. That is, there is very little in the form of an extrasystole to determine its importance. Clinical medicine seems to teach that the causes of extrasystoles are irritability of the myocardium occasioning the origin of the beat from an ectopic centre. This irritability is of nervous influence or the result of debility.

The key to the cause of the irregularity and to its importance is often best found in the

circumstances of the sufferer that is other than cardiac. Thus, when extrasystoles accompanies some definite nervous shock or severe continuing influence it is fair to suspect a neurotic origin while, when, extrasystoles appear in the course of the final stage of debilitating disease it is fair to predicate weakness as a a cause. It is a situation where we must depend on a complete study of the whole person for the interpretation of a local symptom

A great importance of electrocardiography is the differentiation of extrasystoles when they occur in groups from more important and serious conditions, such as fibrillation, flutter and alternation. This paper presupposes a correct diagnosis and as a consideration of the relative unimportance of irregular hearts in young people which have been proved by careful examination to be true extrasystolic arrhythmias.

We cannot enter here into the very interesting field of the many different types of extrasystoles, so we treat them all as an entity

Not only in young people but in many others one of the pleasing experiences in the practice of cardiology is to be able to reassure the worried sufferer of the relative unimportance of premature contractions in otherwise healthy individuals. It has been our good fortune to rescue from invalidism a large number of young people and watch them go on to a successful career which might have been barred to them by the discovery of this irregularity.

At this late day, in the development of our knowledge of electrocardiography, it is needless to remark that extrasystoles are strongly indicated by an intermittent pulse. At irregular intervals the pulse beat lapses. The same thing might happen with heart block, but that is a serious condition and probably would never be met with in young adults. Then, again, the small premature beat can often be felt or heard at the apex during intermission of the pulse. The same individuals often have a respiratory arrhythmia, but this is not a matter of any great clinical importance.

We have gained our object in reviewing this type of heart trouble if we impress the importance of a careful and deliberate appraisal of the condition of young adults with irregular hearts, particularly when the trouble is liable to lead to an interference with their education or plan of life.

In a recent very interesting statistical study of a large series of cases in the Glasgow Medical Journal, Albert A. F. Peel, M. A., B. M., B. Ch. (Oxon), M. R. C. S., L. R. C. P. gives the following conclusions:

1. "Extrasystoles are not confined to patients with organic cardiac disease, but are about twice as frequent in its presence as in its absence. Of patients with no organic lesion about one-third show disease changes which are liable to lead to organic cardiac changes; a small proportion show some other disease; while about one-half show no disease.

2. The organic cardiac lesions most frequently associated with extrasystoles are those of non-infective origin, which yield about two-fifths of the total cases, hyperpiesis being present in one quarter. The infective cardiac lesions form one-quarter of the total cases; of these one-third are acute and two-thirds chronic.

3. The incidence of extrasystoles in general

is influenced by-

(a) Sex—Males show an increased liability.
(b) Age—An increasing liability accompanies increasing age.

(c) Associated diseases—The age and sex incidence of the various associated diseases modifies the influence of sex and age alone.

(d) Some further factor, possibly the menopause, appears to be operative in the female

sex during the fifth decade.

4. While certain clinical conditions appear to exert no influence on the site of origin of extrasystoles, others appear to increase the liability for extrasystoles to arise in particular situations, although they do not preclude their occasional origin elsewhere. Such conditions are chronic aortic lesions which increase the tendency for extrasystoles to arise in the left ventricle; mitral regurgitant lesions, associated with left ventricular extrasystoles; acute infective processes, associated with a tendency for extrasystoles to arise from multiple foci; angina pectoris without high blood pressure, particularly associated with auricular extrasystoles; while the occurrence of pulmonary complications in cases of chronic valvular disease of whatever type would appear to be associated with an increased liability to right ventricular extrasystoles. On the other hand, toxic or functional causes are more frequently associated with extrasystoles arising in the right ventricle.

Apart from the effect of the clinical condition, age and sex produce further modifications in the site of origin of extrasystoles, auricular extrasystoles being relatively less frequent in females, and right ventricular extrasystoles being more common below the age of 30 and above the age of 60 in both sexes, while left ventricular extrasystoles are more common between 30 and 50 in both sexes and between 50 and 60 in males; in females at this age right ventricular extrasystoles are considerably more frequent than left."

In conclusion I would like to emphasize the importance of a wise attitude on the part of the physician towards these young people. A complete and thorough investigation of the situation must be so conducted as not to cause any fear or dread in their minds and it must be definitely understood by them that repeated examinations and technical studies are necessary to prove the harmlessness of their trouble rather than to prove that it is serious. Say to them that you hope to be able to take the responsibility of freeing them from the limitations set upon their activities by proving that they are not suffering from a serious disease and tell them that you cannot succeed in doing this unless you can bring proof to their superior officers or whoever it may be that controls their activities.

I know it is often said that too much attention to neurotic people increases their trouble, but these young people are already on the road to becoming confirmed neurotics and it is much better that this work should be done by those who have an appreciation of this element in the problem than that they should be the victims of all kinds of casual opinions. In fact, a primary, complete and final study of any condition is a mental, moral and financial assets to any sick person, particularly one who is subject to cardiac neurosis. The physician who cannot put his own personality behind his work should never attempt to deal with the extrasystolic arrhythmias of children and young people.

# CANCER-ITS NATURE, PREVENTION, AND TREATMENT\*

By FRANK E. ADAIR, M.D., F.A.C.S., NEW YORK, N. Y.

LTHOUGH tuberculosis is still one of the front-line officers in the army of death, its position of major importance has now been surpassed by cancer. In the United States in 1928, there were approximately 120,000 deaths from cancer, and 100,000 from tuberculosis. The statistics of the Board of Health of the City of New York represent a cross section of the

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

death registration in American cities. In fact, the exactness and detail demanded by the Board of Health makes the registration of deaths more accurate than that of the average American community. As an example of the monthly registration there were, during April 1926, 7,719 deaths recorded in the city from all diseases. Cancer ranked fourth place, while tuberculosis took fifth place, as follows:

Discases	Number of Deaths
Organic Heart Disease	1473
Broncho-pneumonia	865
Pneumonia	678
Cancer	608
Pulmonary tuberculosis	481

With such a relative position among human diseases, it is therefore time that medical school curricula allot the proper amount of time and talent to teaching the subject of cancer to medical students that the subject deserves.

It is also time that some of the appalling mistakes of the physician who FIRST sees the patient be corrected. One of the gravest errors is the physician's assurance to the patient that "it does not amount to much." The chief reason for this viewpoint of the physician lies in the fact that most diseases are self-limiting, and if sufficient time be allowed, the cure will eventually come. This fact places us in the habit of expectant treatment for too many conditions. We are too prone to tell our patients to return at a later date, without sufficiently impressing them that the diagnosis is not yet determined and that it is of vital importance for a diagnosis to be established as quickly as possible. This condition could be improved by more frequently asking for consultations-particularly in the carly stages of the disease when diagnosis is MOST difficult but the cures highest.

It is important that there be established more hospitals and clinics devoted to the exclusive study and treatment of cancer. These hospitals should have complete facilities for good surgery; for expert radiation, including a staff of physicists; for a proper hooking-up of clinical problems to cancer research and laboratory investigation. Such a cancer institution will give a good account of itself; it will lead the way in more effective knowledge and treatment. We have ample experience and precedent in if we glance at the accomplishments of the special hospitals for orthopedic surgery, for children's diseases, for maternity cases, and for nervous diseases. I predict that in ten years a goodly percentage of patients suffering from this lethal disease will be receiving treatment in special cancer hospitals.

If one were to ask "What is cancer?" one would be astounded at the variety of conceptions held. Cancer is a pathologic entity usually beginning as a single lesion. It is capable of growth; of local recurrence; of dissemination; of causing the death of its host. Death is occasioned (1) by hemorrhage, the result of disease growth into a blood vessel wall, particularly when it is complicated by infection; (2) by absorption of overwhelming amounts of toxic tumor products; (3) by pressure on vital organs—as produced by uterine and bladder cancer; (4) by asphyxiation due to encroachment on lung tissue, as in mammary carcinoma or osteogenic sarcoma;

(5) by starvation resulting from stomach and esophageal cancer; (6) and by various other secondary causes.

The two main theories as to the cause of cancer are well known to all: first, the Cohenheim theory of cell inclusions or embryonal rests which later in life commence growth owing to some FACTOR as yet unknown to us; second, the Virchow theory of continued irritation setting up a mutation in the local cells, which will eventuate in a lawless growth. It is also a well-known fact that neither of these two theories is sufficient to wholly account for the beginning or the GROWTH of a tumor. The very beginning of tumor process is entirely different than growth capacity. There are other important factors which are necessary to neoplastic growth. If we knew ALL the various factors which algebraically added would produce neoplasm, our problem would be far simpler. Unfortunately, we know but few of these causative factors. That we are familiar with even a few, however, gives us hope—in fact far more encouragement than is generally recognized or admitted. If our profession and the laity were to utilize the knowledge we already have of these factors, the morbidity and mortality would be greatly reduced. It is definitely possible to intercept or avert the development into a disease entity by upsetting certain factors; this is the crux of my paper.

The factor of which we know most is that of chronic irritation. This may be chemical, thermal, bacterial, or mechanical. Each individual organ, such as stomach, heart, uterus, rectum, antrum, bone, esophagus, tongue cheek, lip, penis, bladder, etc., possesses factors peculiar to that individual organ. These irritation factors are nor common to the other organs.

One of the greatest agents which has retarded the proper study of cancer in the years gone by has been the conception that carcinoma of one organ is the same process as carcinoma in another organ. This has resulted in an attempt to classify all carcinomata under a few large groups and make the cancer producing factor in one organ apply to the production of cancer in another organ. The etiologic factor in breast cancer is different from those causing cheek cancer.

Breast: In the breast, the recent conception seems to be that the most important single factor is chemical irritation resulting from stagnation. By stagnation, is meant obstruction to the terminal ducts with resultant retention of both the desquamated lining cells and their secretions. That these products cause irritation is evidenced by a marked infiltration of lymphocytes. The irritants cause proliferation and degenerative changes in the lining cells; these become heaped up in certain areas, infiltrate through the basement membrane in places; and cause invasion of the breast with development of a true carcinoma. A study made by us of 200 consecutive cases of

breast carcinoma (Adair and Bagg) revealed that 91.5 per cent of these patients had some significant factor in the history—such as cracked nipple, caked breast, abscess, congenital nipple deformity, miscarriage, grave breast trauma, etc. Miscarriage, as far as the breast is concerned, results in the same proliferation of breast tissue with milk production that is found in uninterrupted pregnancy. Much new tissue lies free to degenerate in the lumen of the ducts and acini; this, with the end products of milk decomposition are active sources of irritation.

Of the 200 patients, 126 had given birth to 386 children and had had 172 miscarriages, thus giving the high percentage of one-third of the pregnancies ending in miscarriage.

This study on the human being was backed up by the significant experimental work of Bagg, who used a strain of laboratory mice with a well-known mammary carcinoma incidence of 7 per cent. He caused stagnation by interrupting breast drainage by ligature of terminal ducts immediately behind the nipple. The tumor incidence immediately jumped to 100 per cent. He demonstrated that the most important single factor is stagnation.

The most meticulous care should be taken of the human breast preceding and during the lactation period; the cracking of nipples should be averted by toughening the nipple with daily applications of alcohol. The modern practice of many obstetricians of drying up the breasts immediately following child-birth is not the best practice in the long run. It is true that the present day expertness of our pediatricians in providing substitute formulae for human milk, is life-saving to the baby in occasional instances; but the blocking up within the breast by tight bandaging of a great quantity of milk and a great amount of new breast tissue, makes the mother more prone to the development of carcinoma in later years. Carcinoma has been experimentally produced by repeated local applications of lactic acid. I have found both lactic acid and butyric acid present in old stagnant human milk obtained by a breast pump. In brief, it appears that mothers should attempt to nurse for about six months as a minimum, and that during this time the breasts should receive the greatest care. If caking is threatened, it can at times be averted before going on to abscess formation, by the use of the breast pump.

Many tumors begin as a benign or an inflammatory lesion, and remain as such for many months or years before undergoing malignant changes. Ewing, in discussing chronic productive mastitis states that "inflammatory passes insensibly into neoplastic hyperplasia. The disease begins as an inflammation and often ends as a neoplasm."

It is therefore in the very early stage of tumor development, when irritation and inflammation

are factors, that our preventive measures must begin.

If a breast carcinoma has developed, the radical surgical operation is still the best method of treatment to employ. Pre-operative and post-operative radiation is being used with benefit. As yet we do not rely on radiation to cure this disease. Some work on the part of courageous radiological investigators is very encouraging and highly suggestive of cure, but operation is still the choice. In the aged, the diabetic, or the arterio-sclerotic, heavy radiation is preferable to surgery.

Uterus: Carcinoma of the cervix uteri occurs chiefly in cases of lacerated cervix. Here the factor seems to be mechanical, chemical, and bacterial. At childbirth, the cervix is lacerated; the cervical glands pour forth secretion; smegma and colon bacilli are mechanically pushed to the region of the cervix; putrefaction and inflammation are present; heaping up of cervical gland cells takes place, some of these become invasive;

and true malignancy develops.

Prevention of cervix cancer lies in cleanliness and in very careful repair of cervical lacerations. It is extraordinary, the amount of filth and decomposing material that can be extracted

from the cervix by a suction pump.

If carcinoma of the cervix has developed, it is now well established that the best treatment is heavy radiation by radium placed into the cervical canal by a cervical tandem. This is fortified by heavy radium bombs and H. V. x-ray cycle, applied about the pelvic girdle. By this method, a much higher percentage of patients are living at the end of five years than by surgical removal. This has been proved by many, including Clark, Bailey, Healy, Cutler, Matzloff, and others. The operative mortality of the pan-hysterectomy of Wertheim is comparatively high, and the five year results are not so good as by radium.

Cancer of the body of the uterus is quite a different condition, and here surgery is still the best form of treatment. Surgical removal done with care removes the possibility of pulmonary

metastasis.

Mouth, Lip, Tongue, and Cheek: It is a matter of medical history that clinicians of many decades ago were united in their opinion that cancer of the mouth, cheek, tongue, and lip would never develop were it not for syphilis, bad teeth, and tobacco. Modern opinion has not changed. It is common to see carcinoma develop in the leukoplakic area of a syphilitic infection or a tobacco burn. It is also common observation to note the development of a carcinoma at the exact site where a sharp tooth continuously rubbed and irritated the tongue or cheek, or where an ill-fitting plate rubbed the gum. Prevention lies in the simple correction of these producing causes.

The treatment of intra oral lesions is today turning more and more to some form of radiation because of the mutilation, morbidity, and mortality caused by surgery in these areas. It is not yet proven that five year cures are higher

by radiation than by surgery

Stomach and Esophagus Certain modern vicious habits of boltung the food, or the taking of food into the stomach too hot or too cold seem to be important factors in causing the development of ulcers and carcinomata. We often take food into the stomach so hot or so cold that it is impossible to hold it in the mouth. That carcinoma of the stomach is so commonly associated with advanced pyorthoea is certainly more than a casual observation.

The observance of certain hygicinc rules and the correction of definite habits will diminish the thermal and bacterial insults to the delicate lining membrane of the stomach and esophagus

Although carcinomata of the stomach and esophagus are so common, treatment for their condition offers about as black a chapter in modern therapy as we possess. Our hope of curing carcinoma of the stomach does not lie in modern treatment by surgery or radiation but in

preventive medicine

The reason that carcinoma of the esophagus is such a lethal disease is due to the anatomy of the esophagus. It is but a thin tube, the wall of which is only 3.5 to 4 mm thick. The first symptom of esophageal carcinoma is dysphagia. By the time there is real embarrassment in swallowing, the disease has already penetrated the wall of the esophagus and is out in the loose periesophageal tissues, and then all hope of accomplishing a curre is gone. It now becomes a matter of treating the symptoms of obstruction by performing a gristrostomy so that food may be injected into the stomach by way of the gas trostomy tube.

In general, the above condition obtains for gastric carcinoma By the time the obstructive symptoms are apparent the disease has pene trated the gastric wall and is out in the perigastric lymph-nodes, the omentum or the liver Except to relieve obstructive symptoms by performing a gastroenterostomy, surgical interference is of little avail. It is the unusual case of gastric carcinoma that offers opportunity for stomach resection St John, in a report from the Presbyterian Hospital in New York, had but one case of stomach resection free of disease at the end of ten years The mortality is high. and cures are rare Radiation of stomach carcmoma to date offers us little. It has definitely prolonged life in certain of those cases of highly cellular adenocarcinoma, which are radio sensitive, but owing to their early dissemination, the benefit from radiation lies chiefly in retarding the disease and in preventing obstructive symptoms, not in curing the disease

Caecum, Sigmoid, and Rectum In chronic constipation, the caecum, sigmoid, and rectum become impacted with hard, rough, and desicated food residue. The irritation produced by this mass of feces pressing against, sliding over, and microscopically lacerating the mucous membrane, in all probability is the chief factor in producing carcinoma of this region. The prevention of carcinoma in this location lies in the prevention of stagnation.

Surgery of sigmoid carcinoma gives brilliant results if applied early The disease remains local for quite a long time before penetrating the wall of the gut Carcinoma of the caecum does not offer so much ease of cure as the sigmoid because the latter is comparatively much more movable The caecal carcinoma much more quickly penetrates the lateral abdominal wall Surgical removal of the caecal disease, with intestinal anastomosis, if indicated, seems the most effective treatment. Carcinoma of the rec tum still seems to be a surgical disease as our largest group of cures lies in that field Colostomy should precede surgical removal of the disease Heavy pre operative radiation by 1 rays com bined with the implantation of destructive doses of radium, then followed by surgical removal, seems to be gaining in number of adherents

Gall Bladder In carcinoma of the mucosa of the gall bladder, there is nearly always a preceding and underlying infection. Students of this subject have found the presence of gall stones in 85 to 100 per cent of the cases, and the presence of infection in 100 per cent. It is commonly taught that the cancerous gall bladder is the small contracted one. This is erroneous, as the organ may be either very bulky or contracted. The cure of gall bladder carcinoma is a surgical problem.

Bone In the development of osteogenic sarcoma, Coley is a firm believer in the traumatic
factor as being of special importance. In his
studies, he has found trauma present in 50 to 60
per cent of the cases. Osteogenic sarcoma is
one of the most highly malignant of all the
sarcomata, there being very few authentic cases
of cure. To date, surgery, radiation, and Coley's
toxins are not curative, as a rule, but the combination of these three agents seems to offer the
most. In the Bone Sarcoma Registry of the
American College of Surgeons, the majority of
those few cases with a favorable outcome, have
received the combined treatment of all three
agents

Pents Our commonest examples of penile carcinoma are those cases of long foreskin with retuned secretion near the corona. In this in stance, the chief factors are filth, putrefaction, bacterial and chemical irritation. It is well known that there is practically no carcinoma of the penis among the Hebrew race because of the

fact that circumcision is practiced. This accounts for there being no retention of secretions; no accumulation of filth; no chemical or bacterial irritation.

The treatment of penile carcinoma is by surgery or by radiation. The penis may be amputated and the groin nodes heavily radiated; or, if the penis lesion is not too large, good results are obtained by heavy applications of radium to the lesion, followed by heavy radiation to the regional nodes. If carcinoma develops in the groin nodes, they can be widely excised.

Because of lack of space, we have left untouched the subject of carcinoma in the bladder, skin, antrum, nerve tissue, lungs, lymphatic system, hemoepoietic tissues, brain, etc.

In conclusion we wish to point out and emphasize that each organ possesses cancer producing factors peculiar to that organ; that these factors are many times multiple; that frequently several factors are acting simultaneously in the same organ; and that the hope of reducing the number of cancer sufferers lies in detailed and careful study and control of these factors.

# HEALTH ADMINISTRATION OF THE PANAMA CANAL ZONE\*

By BERTIS R. WAKEMAN, M.D., HORNELL, N. Y. District State Health Officer, New York State Department of Health

URING a recent visit to Panama I had an opportunity, through the courtesy of the Chief Health Officer, Colonel William Chamberlain, to study the health administration of the Panama Canal Zone.

Soon after the United States took over this district for the purpose of building a canal the health department was organized. This department, for purpose of administration, not only assumed charge of health matters, sanitation and maritime quarantine, but maintained supervision of the hospitals, took care of the sick and injured and maintained health supervision of the two Panamanian cities—Colon and Panama. arrangement has continued ever since. This is one of the few places in the world where a health department not only does preventive work but also practices medicine and surgery.

When the United States undertook the construction of the Canal in 1904 Panama was one of the most unhealthful spots in the world. Yellow fever and malaria had been endemic for years, and these, rather than engineering difficulties, had been responsible for the failure of the French Engineer, Ferdinand deLasseps. Yellow fever has been stamped out, and malaria has been diminishing ever since Colonel Garges, the first health officer started his campaign.

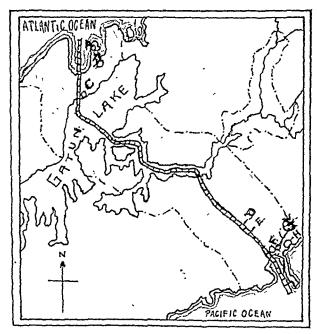

The Canal Zone is a strip of land forty-seven miles long and ten miles wide, five on each side of the canal, and including the shore line of Gatun Lake, an area of 163 square miles with a shore line of 1,100 miles, the largest artificial lake in the world. It also includes a 260 foot contour of the drainage district of the upper reaches of the Chagres River above. Alhajula is the sight of the new storage dam to be constructed.

## Physical Characteristics

You will note by the map that the Isthmus of Panama extends from West to East and the canal

cuts through it from North to South. Caribbean entrance being twenty-seven miles west of the Pacific entrance. It is hard for the average tourist to realize that the sun comes up in the Pacific ocean.

On the Caribbean Sea, there are two cities, Christobal and Colon. Cristobal, an American City is the port of entry on the Atlantic side. Colon, a Panamania City of 31,000 separated from Cristobal by the tracks of the Panama rail-

road. Limon Bay is guarded by Fort Sherman and Fort Randolph. The navy has a submarine

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 5, 1929.

and hydroplane base at Coco Solo. The Army has an aviation base at France Field. Five miles south is an army base, Fort William Davis, for protection of the Gatun Locks and Dam. The Gatun Dam across the Chagres river impounds a body of water 85 feet above the Atlantic sea level

North from Gamboa the upper reaches of the Chagres River, which are to be impounded by a dam at Alhajuela, are in the Canal Zone. A few clearings have been made between Gatun and Pedro Miguel locks for pastureage (40,000 acres) of dairy and beef cattle (8,500 head). There are also a number of clearings made for banana plantations, which are leased to the United Fruit Co. The balance of the Canal Zone is left in the jungle state. Improved highways extend from Colon to Gatun and from Panama north to Gamboa. The stretch from Gatun to Gamboa has no roads, but is served by the Panama Railroad. The continental divide is at Gold Hill, site of the Gaillard Cut (Culabra). An improved highway is now being constructed from Sumit, north to Alhajuela, which will eventually be extended to

Army posts on the Pacific sector are located at Pedro Miguel, Fort Clayton, Carozal and Fort Amador.

On the Pacific side of the Isthmus are located the American cities of Balboa and Ancon, on the Canal Zone and outside of the Canal Zone, the City of Panama, the seat of the Panamanian Government, Balboa and Ancon are separated only by a street. The boundary of the Canal Zone and the City of Panama is the Aveneda Central, one side of the white line is American, the other side is Panama.

Tidal Variations—The sea level of the Pacific is eight inches higher than the Atlantic, except in the month of February when they are the same. This variation is due to current, tidal and wind influences. The Atlantic tidal variation is one foot. The Pacific tide ranges from 12½ to 21 feet with the average of 16 feet.

Climate—The climate is tropical with heavy rain falls, especially on the Caribbean Coast. The average temperature is not over 80 F. The dry season extends from January to April. The heaviest rains occur during October and November.

### Organization—Canal Zone Government

The organization for the operation and maintenance of the Canal and the government of the Canal Zone, as at present constituted, was established by the President in conformity with the provisions of the Panama Canal Act of August 24th, 1912. Authority is vested in a Governor as head of the organization known as the "Panama Canal." The Governor is also President of the Panama Railroad. The Panama Canal is an

independent establishment in the Government Service, directly under the President; but as a matter of Executive arrangement, the Secretary of War represents the President in the Administration of Canal affairs.

The organization on the Isthmus includes a number of departments and divisions in charge of the various activities as follows:

### Department of Operation and Maintenance

Divisions—
Marine
Mechanical
Dredging
Lock operation
Electrical
Municipal Engineering
Fortifications.

Supply Department
Quartermaster
Subsistence
Commissary
Cattle, Industry and Plantations.
Hotels (Washington—Tivoli).
Accounting Department
Health Department
The Executive Department
The Panama Railroad.

The following table shows the distribution of population for the Canal Zone including the Panamanian Cities of Colon and Panama.

### Population

Canal Zone—June, 1928			
Population	White	Colored	Total

Panama Health Office

Health Officer-Dr. Goldthwaite.

5 Sanitary Inspectors.

2 Veterinarians and meat inspectors.

1 Vaccinator.

Cristobal—Colon Health Office Health Officer, Dr. Byrd.

3 Inspectors.

2 Veterinarians—Meat Inspectors.

For the fiscal year ending June 30th, 1928, the expenditures of the health department amounted to \$1,520,199.00. The earnings of the department were \$723,426, making the department forty-eight per cent (48%) self-supporting. The receipts were from fines, hospital fees, quarantine fees, laboratory fees, the care of insane and lepers from the Panamanian Government, etc.

Water Supply—Cristobal and Colon obtain their water from the Brazos Brook Reservoir—capacity 650 million gallons and is located about 2½ miles south or these two cities. The reservoir is about 1¼ miles from Mount Hope. The water flows by gravity to the pumping plant at Mount Hope where it is filtered and pumped through 20 mains. Capacity at Mount Hope filteration plant (slow sand) is 8 million gallons per day.

The water supply for Pedro Miguel, Paraiso, Ancon, Balboa and the City of Panama comes from the Chagres River (Gatun Lake) 18 miles from Panama City. The water is pumped from the lake level, which is from 80-87 feet above sea level, to a standpipe (balancing revervoir) from which point it flows by gravity through a 36 inch main to the purification plant (slow sand) chlorinated at Miraflores, capacity 17 million gallons per day. There it flows by gravity to the pumping station at Balboa, where it is pumped into 2 service reservoirs (high and low) then by gravity to the consumers.

The water for Pedro Miguel and Paraiso is pumped from the Miraflores purification plant.

Gatun is furnished filtered water. The raw water from the lake flows by gravity to the filtration plant where it is pumped directly into the distributing system.

The small hamlets between Gatun and Paraiso

use well water.

Milk Supply

The City of Panama has a full time milk and dairy inspector—a highly trained veterinarian. In the city and its environs there are 35 dairies with an average daily production 5,000 quarts per day. This milk is sold in bottles not only in Panama but in Ancon and Balboa. About 50 gallons are sold in bulk to the Ancon hospital and about 100 gallons to the Canal Zone restaurants, 75 gallons are sent to Colon by train. All dairy cattle are tuberculin tested. All the milk is pasteurized. Milk retails at 25c per quart.

In addition to the above, the Canal Zone Health Department operates a modern well-equipped dairy of 100 tuberculin tested cows at the Carozal Hospital (insane). This milk is used mostly in the hospitals and dispensaries. Milk for Zone babies can be obtained on order from this dairy. A resident veterinarian supervises this farm and dairy. The milk is pasteurized in a modern plant. Sewage Disposal

The Canal Zone including the Cities of Colon and Panama have a duel system of sewers—sanitary and surface. The arrangements for sewage disposal is relatively simple. The seaport towns have sewer mains running out into the respective bays far beyond the line of low tide. The inland towns discharge their sewage into the streams losing themselves into the sea or into Gatun Lake.

Some of the smaller native hamlets have no sewerage systems. In these places pit closets are maintained which are disinfected weekly and cleaned when necessary. In a few locations, septic tanks are maintained.

The low elevation of Colon, which is founded on a fill on Coral Reef, makes it necessary to pump part of the sewage out to sea. The storm sewers in this location have to be pumped occasionally, by a pump on a truck which can be moved from point to point is needed.

### Garbage Disposal

All the garbage and municipal waste from the City of Panama, Ancon Balboa, Fort Amidor and Quarry Heights is gathered duly by big auto trucks and dumped on the flat lands south of the City of Panama where it is sprayed with hot oil and covered with soil. After a period of two years these sections are opened for streets and house building

The garbage and wastes from Cristobal and Colon on the Atlantic side are disposed of in a similar manner. Large incinerator plants were maintained, but these were expensive and created

a nuisance from the odor

Incinerators are still maintained at Pedro Miguel, Fort Clayton and Carozal

### Meat Inspection

A thorough system of meat inspection is main tained including the cities of Colon and Panama, by trained veterinarians. The abattors are lo cated at Colon, Mount Hope and Panama. All cattle, hogs, horses and mules for entry into the Canni Zone are inspected.

### Santary Inspection

Three sanitary inspectors are connected with the Cristobal Colon Health Office. The Canal Zone proper is covered by four inspectors, one for the northern district, one for the southern district, one for Ancon district and one for Ancon suburban district. There are five sanitary inspectors for the City of Panama. These in spectors see that the provisions of the sanitary code are carried out. Particular attention is given to mosquito control, building and back yard inspection and rat proofing.

### Mosquito Control

Mosquito control embraces by far the largest activity of the Canal Zone Health Department Yellow fever has not been present in the zone since it was stamped out by Dr. Gorgas in 1905. The rate of malarial infection in the zone and terminal cities has touched the lowest point ever reached since the United States began operations on the Isthmus. The malarial carrying anophe line mosquitoes vary in numbers from one year to another. This lowest malaria and improvements in the similated areas which have taken place in

recent years and to the greater ease with which mosquito control is now carried on in these areas Concrete bottomed ditches and subsail tile drains have simplified the maintenance of the draining system by which mosquito breeding is maintained

There are about 135 species of mosquitoes on the Isthmus, but most of them breed and spend their lives in the jungle, rarely if every attacking min. Only a few species are of sanitary or economic importance and these for the purpose of mosquito control, may conveniently be divided into two general classes.

A Mosquitoes which transmit malaria—Ano pheles

B Mosquitoes which transmit yellow fever and dengue fever (Stegomyia)

(The yellow fever mosquito is essentially a do mestic animal, laying eggs in artificial collections of clear water. Mosquitoes breed in the home or yard and fly short distances. Less than 1% of

the total No problem)

Screening and mosquito killing are both used for the prevention and control of the mosquito menace. The sanitary code requires that every building in the Canal Zone which is used for human hibitation must be properly screened and approved by the sanitary inspectors. Copper or bronze wire screens are now used exclusively, and each building is carefully inspected from time to time, to see that the screens are intact and mosquito proof.

Mosquito killing is accomplished by spraying with hot fuel oil, the lake shores, rivers, streams and ditches every ten days. Particular care is given to all new developments along the jungle borders. Inspectors and mosquito catchers are on duty day and night, wherever a new territory is opened up. Hydraulic filled land is frequently inspected for the purpose of discerning and eliminating any pockets of stagnant water which may develop. Garbage dumps are sprayed with hot oil daily and covered with dirt.

### Hospitals and Dispensaries

Three hospitals and five dispensaries are main tained on the Canal Zone There is one general hospital (Santo Tomas) in the City of Panama

Ancon (Gorgas) Hospital, capacity 800 was built by the French, modernized and enlarged by the Health Department. The administration building and the ten attractive concrete pavilions, are built with special regard to tropical heat and rainfall. This hospital is maintained from funds appropriated by Congress and from its earnings. The earnings last year were 51% of the gross cost of operation. It has a stiff of 25 physicians, 5 internes, 75 nurses and 255 other employees. Practically all bed patients in the Canal Zone are hospitalized.

This hospital furnished necessary care for all employees of the Canal and their families (except for residents of the Atlantic side 4ho for emer-

gency or other reasons are treated at Colon Hospital), for the Army and Navy personnel and their families, for Canal Zone charity cases, for crews of ships making these ports, and for passengers of ships and others who may desire to enter and are able to pay the rate fixed by schedule for such non-government patients.

Colon Hospital, capacity, 80 beds is operated chiefly as an emergency hospital and dispensary for the benefit of those living on the Atlantic side of the Isthmus.

Carozal Hospital, capacity 600 beds, is an institution for the care of the insane of the Canal Zone and of the Republic of Panama, it being reimbursed for the latter class of patients by the Republic at a fixed rate of \$.75 per day. It also cares for alien employees of the Canal Zone who are disabled by reason of injuries or chronic diseases and who desire to enter the institution.

## Laboratory Service

On the grounds of the Ancon hospital the health department maintains a Board of Health Laboratory under the direction of Dr. Lewis B. Bates. Two army surgeons, a major and a captain are detailed to this laboratory as pathologist and bacteriologist respectfully. There is also a chemist attached to the laboratory. Upwards of 35,000 specimens are examined each year.

The health department offers a bounty of 25 cents for every snake brought to the laboratory for identification as each year there are a number of deaths from snake bite. 1,564 snakes were sent last year to Dr. Thomas Barbour of the Division of Comparative Anatomy, Harvard University for examination. A small amount of antivenen is furnished the laboratory by Dr. Barbour. Of the great number of snakes found in the jungle only four varieties are venomous.

Over 16,000 Wassermann tests are made during the year. About 300 autopsies are made yearly on patients dying in Ancon Hospital, which is 70% of the deaths.

The undertaking department is under the supervision of the laboratory. All embalming on the Canal Zone is done here.

Palo Seco Leper Colony, capacity 102. Population 6 white, 1 Chinese, 95 colored. 75 of these patients are from the Republic of Panama for whose care the Panamanian Government pays the Health Department at the rate of 75 cents per day. The other 27 resided in the Canal Zone territory at the time of their admission to the Colony or were employees of the Panama Canal.

The colony is located on the wooded shore of Panama Bay about four miles West of Balboa and accessible only by motor boat and punt through the serf. Last year a fine administration building including an operating room and dining room were erected. The colony is under the supervision of a full time resident physician.

Dispensaries.

The five dispensaries scattered over the Canal Zone are used by the canal employees and their families and are for ambulant cases only.

The physicians attached to these dispensaries make one call to quarters when necessary and the patient is then usually transferred to one of the hospitals. Home calls are rather expensive and are discouraged as far as possible.

A hospital car, attached to the regular trains on the Panama Railroad bring patients from the various points along the canal to the hospitals or dispensaries.

### Health Centers

Health Centers for infants and children are maintained at Ancon, Balboa and Pedro Miguel. Under the direction of the Public Health Nurse many of the mothers of the Pacific side have taken great interest in these centers. 700 visits have been made to these health centers and the nurse made 1,034 home calls the past year.

The Cristobal Women's Club Free Clinic, in the City of Colon, is operated jointly by the Cristobal Women's Club and the Health Department. The health officer of Colon is director and the health department supplies the nurse. The clinic has confined its work to infant welfare, prenatal, dental and eye, ear, nose and throat work. Milk is prepared and feedings are provided for approximately 25 babies daily.

# Medical School Inspection

Panama Canal physicians assisted by trained nurses make annual physical examination of all Canal Zone children, both white and colored.

The visiting nurse makes weekly inspections of the schools of the Pacific end of the zone. She also assists in the examination of school children in the City of Panama and in the work of the Baby Clinic of the Panama Red Cross.

### Vital Statistics

You will note from the following table:

		-	
	Vital Statistics	Canal	N. Y. State
Birth Rate	Canal Zone	18.34	20.9
	Panama	35.50	
	Colon	24.13	
Death Rate	Canal Zone	6.72	12.9
	Panama	19.32	
	Colon	13.65	
Infant Mortality		58.56	71.2
(Cases 13 white-	-44 black)		
	Panama	144.28	
	Colon	129.21	
Tuberculosis	Canal Zone	0.65	93.8
	Panama	3.39	
	Colon	2.46	

That the health work of the Canal Zone compares favorably with that of New York State. In comparing these two localities one must consider

some of the characteristics of the zone population. The Americans who are employed on the Canal Zone are usually carefully selected as to age and physical condition. Most of the Americans are from the early and middle age groups. If any of them are incapacitated they return to the states. There are few or none of the "old people" group among the Americans on the Canal Zone.

### Communicable Disease, 1928

Malaria—There were 1250 cases of malaria reported in the zone and cities. There were no deaths. At Bruja Point a gang of men were engaged in construction work (forts) for the Army and were housed in a temporary camp outside of the sanitated areas. Among the 400 employees, 188 cases of malaria developed. Half of the men employed developed malaria within five months. This furnishes an example of what would occur on the Isthmus if sanitary measures should be relaxed.

Diphtheria—In the tropics diphtheria is not a serious disease. The cases are usually rather mild and at no time during the past 20 years has the disease assumed anything even approaching epidemic proportions, locally.

In a period of 20 years on the Canal Zone, a total of 252 cases of diphtheria, have been admitted to hospital. During the same period there have been 7 deaths among the residents of the Canal Zone and 100 deaths among the residents of Panama and Colon, 84 of these being in Panama City and 16 in Colon. During the last 7 years there has not been a death reported among the residents of the Canal Zone. This certainly speaks highly for the health service given to these people. Deaths occurring in the hospitals of the zone have generally been in neglected cases where either no medical advice was sought or where the disease was not recognized. In some cases there was an illness of from 5 to 18 days prior to admission to the hospital and in a few cases there was no medical attendance, the disease being found at autopsy. In those cases received in the hospital early the course was mild and the recovery prompt. Records were found or five cases of diphtheria among the hospital attendants, four nurses and one orderly. There have been four cases of post diphtheritic paralysis treated during the 20 years. Of the 252 cases admitted to hospitals of the zone there have been 41 per cent of pre-school age, 36 per cent of school age, and 23 per cent of adult age. These percentages show that any control measure cannot be limited to any one age group. Control measures on the zone have consisted in prompt diagnosis, hospitalization, early administration of antitoxin, isolation of all positive cases and also of all suspected ones. All contacts are closely watched, being inspected at frequent intervals and close contacts are cultured as well. That these measures have been adequate and effective is proved by the extremely low incidence and death rate and by the fact that at no time has the disease reached epidemic proportions.

In Panama City conditions are less favorable. No statistics are at present available to cover the same period as those presented for the Zone. The health officer of Panama has furnished me data covering the years 1925, 1926 and 1927. These figures show a total of 338 cases for this 3 year period with 16 deaths. When these cases are separated into the same age groups, pre-school, school, and post-school or adult, 38 per cent of the cases fall into the pre-school age, 40 per cent into school age, and 22 per cent into post-school These percentages do not vary markedly from those for the zone cases but do show that protective measures can not be confined to any age group. 87.5 per cent of the cases reported in the City of Panama during the last three years have been among the blacks and only 12.5 per cent among the whites. During the last two years there has not been a diphtheria death reported in the white population The greatest problem is presented by the black population of Panama City due to overcrowding and neglect,

Typhoid Fever. Four cases reported last year—one death All non-residents. These cases were hospitalized from the Maritime quarantine station.

Hookworm—546 cases reported occurring in the City of Panama.

I can best summarize the health activities of the Canal Zone by quoting a statement from Dr. John D. Long, Chief Quarantine Officer of the Panama Canal Zone. He says:

"Those of us here on the Canal Zone, that small strip of land that is, perhaps the most intensively and effectively sanitated spot on earth today, have exceptional opportunities to observe in advance of many others the direction future public health tendencies may take. We have a compact community, we are highly standardized; as to our work; our dietary; our clothing; our pleasures, even as to many of our methods of procedure and thought. The rest of the world will not arrive at such a state of affairs for many years to come.

"We have the lowest death rate in the world, the lowest infant mortality, the lowest malarial incidence in any tropical country, social and economic conditions are good, population on the zone is practically stationary and poverty does not exist, so may be once again the Panama Canal Zone will serve as the laboratory in which the Public Health destinies of the future will be worked out."

### GRANT C. MADILL, REGENT

The Legislature has acted wisely in electing Dr. Grant C. Madill, of Ogdensburg a member of the Board of Regents of the University of the State of New York. The Regents have charge of the educational system of the State of New York, from the kindergarten to the Medical and other professional schools, including the licensing of physicians, dentists, veterinarians, nurses and other professional practitioners.

To physicians generally Dr. Madill is known as a skillful surgeon and a past president of the Medical Society of the State of New York. His close friends and associates also know him as a cultured gentleman whose extensive literary library is reflected in his daily speech and his public addresses. He will bring to the Regents a practical combination of professional judgment and literary appreciation.

### THE CANCER PROBLEM

Special attention is called to two articles in this issue of our Journal The first article is on "Cancer as a World Problem," by Dr Joseph C. Bloodgood, of Johns Hopkins University, while the second is on "The Nature, Prevention and Treatment of Cancer," by Dr Frank E Adair, of New York City These discussions of the cancer problem will appeal to family physicians for their style is simple and clear, and their content is practical. They will be of special help to those physicians who are seeking to educate themselves, their brother practitioners, and the people regarding the prevention and control of cancer.

Cancer ranks with tuberculosis and heart disease as the greatest cause of human deaths Efficient methods of control and prevention of tuberculosis have been developed and standardized with the result that the incidence of this disease is progressively decreasing The methods of the control of heart disease are also becoming standardized and applied with results both satisfactory and efficient But cancer still remains the dreaded menace of former years and is claiming more victims than ever before.

The attitude of both the medical profession and the people toward cancer at the present is similar to their attitude on tuberculosis and heart disease a half century ago, yet Dr Bloodgood points out the fact that the application of methods already known will reduce the cancer mortality to one-half its present rate—a result which is almost as good as that in tuberculosis and heart disease History will repeat itself, and the present stage of ignorance and fear will be replaced with hearty cooperation of patients with their doctors in methods of prevention and relief

The lack of knowledge of the cause of cancer has led many physicians and most laymen to think that little valuable is known about cancer, and they therefore take a hopeless view of the problem; but the outlook is more hopeful than it may seem, as is shown by a comparison of conditions in cancer with those in tuberculosis and heart disease.

1 Cancer is far more insidious in its onset than either of the other two diseases Both tuberculosis and heart disease produce fatigue, and weakness, early in their course,—feelings which drive the patient to seek relief, but cancer begins as an insignificant sore, or lump, or crust and may progress to a malignant stage before it gives signs of evident sickness and disability. Physicians are talking more and more about cancer in its pre-clinical stage, or that stage in which it is not cancer, but is readily curable

2 Tuberculosis and heart disease tend to get well, and many patients who have one of these diseases recover completely after a transient

sickness; but when cancer actually exists it usually goes on to a fatal stage. Just because it is usually fatal people neglect the pre-clinical condition or the doctor dismisses the patient with the advice "It is nothing. Come back if it gets worse."

- 3 The treatment of tuberculosis and heart disease is medical and hygienic, but that of cancer is mainly surgical,—severe in the later stages of the disease, but simple and local in the preclinical stages. Yet the fear of the knife is the greatest of all deterrents which keep people from seeking or accepting relief from possible cancer
- 4 Physicians no longer hesitate to tell patients that they have tuberculosis, or heart disease Doctors tell their patients that if they rest and live a hygienic life, they may expect to get well But they are not able to give this assurance to their cancer patients unless the disease is in its preclinical stage Here is the doctor's great oppor-The physician need not tell the patient that a persistent sore, or a lump, or a crust, is cancer; but it is his duty to insist that the patient shall accept efficient treatment for the condition, before it turns into something worse Patients are comforted by the assurance that the condition from which they suffer is not cancer, and that if it is cured there will be no cancer develop at that point
- 5 The campaigns of education regarding tuberculosis and heart disease have pointed the way for similar campaigns regarding the pre-When the cancer vention and cure of cancer lecture is arranged, over one-half of those who may be expected to attend will stay at home from fear that they will hear something unpleasant about cancer. In their minds it is inconceivable that cancer can be anything but an advanced condition, gruesome and horrible in all its details Those who lecture to popular audiences on tuberculosis and heart disease scarcely mention their advanced stages There is no need to mention cancer in its fully developed stage, or to frighten people with the statement that the only cure of cancer is the knife, although the statement may be true. The people need to be reassured that cancer in its pre-clinical stage is as susceptible of treatment as is either tuberculosis or heart disease in its incipiency. A lecture or campaign for the suppression of cancer designed for ordinary mixed audiences had better be confined to a consideration of the disease in its pre-clinical stage. If people would attend to the little sores, and lumps, and scabs and discharges that develop in accessible situations, the incidence of cancer would be cut to one-half or one third its present
- 6 Quacks no longer annoy patients with heart disease and have practically ceased to solicit

those with tuberculosis as they did in former years, but cancer quackery still flourishes. The fear of the knife is nourished by the advertisements of quacks who promise sure cures without the knife. The quacks flourish on mistaken diagnoses, for everything that comes to their mill is Over one-half the cases which are referred to cancer specialists are sent away reassured that their condition is something other There are higher odds that those than cancer. who go to the quacks are not suffering from cancer at all, but some condition which would get well of itself, or would respond to proper treatment. Quacks do incalculable harm by instilling a fear of the legitimate means of relief from a cancer when one actually exists.

The control of cancer will require both the education and the inspiration of physicians and the people. The work must start with physicians,

for it is they who will see the people while their conditions are in the pre-clinical stage. If the doctors would treat these pre-clinical conditions conscientiously and persistently, they would solve the cancer problem, for they would reach practically every potential cancer patient. The control of cancer therefore depends largely on the attitude of the individual doctor toward his individual patient.

But there is another phase of the problem. The doctor cannot treat the patient unless that patient wants to be treated. People need to be educated regarding the dangers of neglect of small lesions and the relations of incipient conditions to fully developed cancer. Malignancy has a terror because it is now strange and mysterious. The cancer problem will be simplified when education removes its mystery.

## ALEXIS ST. MARTIN AND DR. BEAUMONT

An account of Dr. William Beaumont and his experiments and observations on gastric juice made on Alexis St. Martin was published in this Journal of December 1, 1929, page 1144. At that time we were unable to find the record of life of St. Martin, but the January issue of Colorado Medicine, page 20, contains the following note:

"Alexis St. Martin, the French Canadian subject of Beaumont's experiments, died in 1880 at the age of 83 years and was buried at St. Thomas de Joliette, Canada. It must be

unhappily recorded that his family successfully defeated the earnest efforts of members of the medical profession, including Osler, to get an autopsy."

St. Martin, an ignorant Canadian laborer, was 25 years of age when he was wounded in the stomach on June 6, 1822, and was treated by Dr. Beaumont who was then 37 years of age. He was in the doctor's employ for eight years beginning in 1825, in order to be the subject of experiment and observation of stomach digestion.

# LOOKING BACKWARD THIS JOURNAL TWENTY-FIVE YEARS AGO

The Health of the Nation: A quarter of a century ago Departments of Health were the leading organizations practicing public health. Dr. Walter Wyman Surgeon General, U. S. Public Health Service, writing in this Journal of March, 1905, calls attention to the leadership of official departments of health in preventive medicine and then continues:

"Thus far I have spoken only of the official health organizations, which are, of course, the most potent of all, based upon the statutes of the States and the nation, continual in their operations and not dependent upon spasmodic effort or ephemeral enthusiasm. Yet it is impossible to ignore the valuable results of auxiliary organ-

izations, voluntary in character, but inspired by noble and patriotic motives. They are too numerous to mention in detail, but I may refer to such organizations as the great American Medical Association, the American Public Health Association, state, county and city medical societies, and the auxiliary sanitary associations that exist in so many of our States and cities. Through these public sentiment is developed which crystallizes into statutory laws and organizations."

It is to be noted that Dr. Wyman places organizations of physicians next to health departments in public health activities; but he evidently did not foresee the extent to which "Sanitary Associations" would engage in public health work.

# MEDICAL PROGRESS

Primary Cancer of the Liver Apparently Cured by Resection .- It is usually stated in reference works that primary cancer of the liver is excessively rare and that when present it is usually congenital, developing in the first months of life. Secondary cancer of the liver from extension or metastasis is common enough. J. L. Nicod and H. Paschoud of Lausanne report a case of primary cancer of the liver in a woman Exploratory laparotomy in a case of abdominal tumor showed that a voluminous growth occupied nearly the entire right lobe of the liver. A vain search was made for a primary focus of cancerous disease, but not even an enlarged lymphnode could be found anywhere. So extensive a resection would be without theoretic justification and difficult of execution but the disease seemed isolated and the authors, after consultation, enucleated the mass in such a manner that the sections of the liver could be sutured. The gall-bladder was removed with the mass. The hemorrhage was not dangerous, all wounds were healed in 16 days, and the patient has since been gaining weight. The growth proved to be an epithelioma, of adenomatous arrangement with marked trabeculation,-Schweizerische medizinische Wochenschrift, December 7, 1929.

Pseudo-Laziness,-H. Codet refers under this title to pathological states which are hastily regarded as due to natural indolence. He deals with this condition only as found in children, some of whom are really backward in development while others do not receive sufficient nourishment. In a few cases some disease is in its prodromic or incubational stage, while in another group an endocrine factor may be involved, as hypothyroidism. Adenoids are known to cause apathy among other symptoms. Ocular affections including anomalies of refraction may tend to cause indolence as shown by the improved status which follows correction by glasses, operation for squint, etc. Other factors traced by the author comprise insufficient sleep, anomalies of the vegetative nervous system, psychic conflicts with parents where a strong sense of injustice may be present in the mind of the child, overstudy in school, exhausting play, etc. There is, however, an endogenous type in which no causal factor can be isolated. The author appears to omit one of the most striking causes, to wit, the effect of a series of the illnesses of childhood occurring in rapid succession. The author appends a considerable bibliography but most of the titles have to do with overstudy in school.-Le Progrès Médical, December 14, 1929.

Some Points in Connection with Cataract Extraction.—R. H. Elliot takes exception to the usual advice that a cataract must be mature before operation is undertaken, even if the sight in the other eye is so defective that the patient is nearly helpless. The exact date for operation should be decided upon after careful consideration of all the factors in each individual case The advice that if the second eye sees well, it is a mistake to have the first one touched is eminently unsound in many cases, as to be blind in one eye exposes a person to many risks. In favor of early operation is the fact that in the elderly every year lessens the patient's resistance to operation. No person should be allowed to go blind and to drop his normal activities, as the probabilities are that he will never take them up again. When a patient cannot read and carry on his usual activities with comfort, he should be operated upon without delay. Hypermaturity should be avoided, as it brings in its train definite risks of secondary glaucoma and a slow form of It is highly important to maintain the morale of the patient, hence it is an advantage to operate before he has lost hope and become despondent. Before submitting a patient to operation all sources of autoinfection should receive attention. Elliot prefers to operate under a conjunctival bridge, and would not think of reverting to the old operative incision. Six weeks after extraction any after-cataract can be dealt with by discission, and then a wait of some weeks is necessary before lenses are prescribed. During this time the patient should have useful vision of the other eye. He may use the eye that has been operated upon as soon as he can do so without pain or discomfort. Operation should not be denied in diabetes, provided the patient's general health is good; neither is a pathological tremor a contraindication to operation. The only medical treatment of cataract that the writer has found beneficial has been the exhibition of thyroid extract in suitable cases.—British Medical Journal, December 21, 1929, ii. 3598.

Spleen Therapy in Tuberculosis.—G. F. Watson relates his experience with a case of lymphatic leucemia in which marked improvement in the general condition of the patient and in the blood count, an increase in weight, and a decrease in the size of the spleen resulted from injections of a raw extract of spleen. This success led him to try the spleen extract in maliginant conditions and tuberculosis. The results in the former were not encouraging, but in the latter decidedly so. In six cases of early tuberculosis, three of which are described in detail, there

was a definite increase in weight and appetite, red blood cells and hemoglobin. The gray pallor of the face changed to a healthier tone and the patients felt much better. At first it was thought that the beneficial effects were merely those resulting from an increase in the red blood cells, but it was found that there was an increase in lymphocytes, leucocytes, and endothelial cells. It seemed also that the spleen extract might have a specific effect on the resistant lipoid envelope encasing the tubercule bacillus. W. D. Swan, who has also been employing this treatment, is of the opinion that spleen extract has a specific effect on the disease. In reviewing the literature Watson finds that Danilewsky (1895), Bayle (1903), and later Armande-Delille have reported favorable results from the use of spleen therapy in tuberculosis. He adds that he is employing spleen extract in two cases of Hodgkin's disease (in conjunction with x-ray therapy in one case), and in both the glands have become smaller and much softer, and there has been an increase in red blood cells and hemoglobin. He feels sure that the extract has been of benefit in these cases.—Canadian Medical Association Journal, January, 1930, xxii, 1.

Early Diagnosis of Whooping Cough.—K. Ochsenius refers to the difficulty of early diagnosis, which is made only after an observation period. The cough of neuropathic children with simple colds often simulates the early paroxysms of the specific disease. Objective finds are usually negative and we cannot depend on the statement that the cough is worse at night. practitioner must abandon his objective quest and depend more on the testimony of the patient's relatives. The parents or others are more familiar with the natural evolution of whooping cough than the medical men, save when the latter have followed up cases in their own families. More valuable in the history than the whoop are the double paroxysms with an interval of a quarter to half a minute. Where we find the twostage paroxysms a blood test may prove of value, for a lymphocytosis at this period has no little diagnostic value. We may find only an ordinary leucocytosis, but the lymphocytosis will appear later and the blood count should therefore be followed up. It must not be understood that all coughing spells are double for before the acme of the disease the double cough is alternated with ordinary coughing spells; but at the acme all paroxysms are apt to be double. The time required for the supervention of the double cough varies greatly and it may therefore be too late for early diagnosis. It is highly important for the practitioner to be present during a paroxysm; this is not always possible in ordinary office practice and several medical men have suggested precipitating a paroxysm by means of some mild irritant, such as oil of tur-

pentine, sprayed into the throat by an atomizer. Certain children can also bring on a paroxysm as a result of conscious suggestion—and the mere mention of a coughing spell may serve to provoke a typical paroxysm.—Münchener medisinische Wochenschrift, December 27, 1929.

Prevention and Treatment of Seasickness.— Ivan D. Mishoff took with him on a long ocean voyage his concusser and vibrator. socket could be made to fit the vibrator he felt the first symptoms of seasickness and decided to have the concusser employed. His symptoms responded readily to several treatments. prefers the concusser to the vibrator as it is easier to carry and to attach. During the trip he was able to afford relief to a number of passengers, among them two pregnant women who were experiencing morning sickness which the sea caused to become twenty-four hour sickness. The ship's physician had treated them many days when they asked that the concussion method might be tried. To this treatment they responded very rapidly, and the relief lasted several hours. By concussing them morning, noon, and night the writer effected a perfect cure. Mishoff thinks that in seasickness the pylorus is contracted and reverse peristalsis takes place because the brain cells which preside over the palate and the stomach are irritated. The concussion or vibration of the interspace between the fourth and fifth dorsal vertebræ opens the pylorus and at the same time soothes the nerves of the brain which control the palate and stomach. hence the relief. Thirty strokes, one stroke in two seconds, is given, so the treatment takes just one minute. The interspace is tender, and if the malady has lasted long, the spot is sensitive or even painful to the touch. When such is the case, the stroke should be lighter and the interval between strokes longer, say four seconds. Better results are obtained by concussing the seventh cervical vertebra first. If there is headache thirty additional strokes are given close to the skull; this causes the headache to disappear.—Physical Therapeutics, January, 1930, xlviii, 1.

Operative Case of Hirschsprung's Disease.— S. Sjövall reports the case of a boy of 13 admitted to hospital with the diagnosis of acute dilatation of the stomach and intestines. He was apparently normal at birth but at the age of two years the abdomen was seen to be unduly large. The bowels were at first regular but by the age of 5 he had begun to suffer from constipation which grew worse until the movements occurred at intervals of 4 to 7 days and then only with the aid of an enema. The boy was virtually an invalid, unable to play with his fellows. When he began to suffer from cramps with inability to evacuate the bowels even with enemata, he was taken to the hospital, where

first-aid measures of colonic irrigation brought away much gas and feces and reduced the size of the belly. The acute dilatation symptoms therefore no longer existed. A rontgen plate now made the diagnosis of the basic condition which was technically megasigmoid. A provisional appendicostomy was first made and in a second stage the entire enlarged and dilated sigmoid was exsected, the segment having a length The descending colon was now of 60 cm. joined with the stump of the pelvic colon by a lateral anastomosis, necessitated by the difference in diameter of the two stumps. The greatest circumference of the segment was 32 cm. appendicostomy fistula was allowed to close. Healing was smooth and the result ideal, the boy having been made over into a perfectly normal individual. Although many cases of Hirschsprung's disease are on record, the number of radical operations is not large and the author can find but five in the Swedish literature. The operative record is probably held by Finsterer of Germany-11 cases with one fatality. It is readily apparent that megasigmoid is much more amenable to operative treatment than dilatation of the entire colon, and fortunately the sigmoid alone is involved in nearly half of all cases .- Acta Chirurgica Scandinavica, December 30, 1929.

Codeinism.—The claim has usually been made that this alkaloid does not act upon the higher cerebral centers but only exerts a cedative action on the cough center. Addiction, therefore, has been regarded as impossible and the classification of codeine as a narcotic under the law has often been criticized. But according to Hans Schwarz, who is an associate at the Charité Hospital Neurological Clinic, an addiction which resembles closely morphine addiction is known, and he reports three cases of it in detail. The first was in a man of untainted stock who for years had procured codeine from druggists of his own accord for an irrigating cough. His addiction was secret until failing health and the need of large sums of money, and occasional alcoholic excesses caused him to make an unsuccessful attempt at breaking off. Failure sent him to the clinic where he was weaned from the drug with but little trouble. He had been taking as high as 45 grains daily. The drug produced an increased capacity for work and on withdrawal he developed diarrhea and sneezing fits, various pains, and insomnia. He was cured in two months and had not relapsed after five years. The other cases sufficiently resembled the first and all bore a strong resemblance throughout to morphine addiction, including withdrawal symptoms. As is the case with morphine addiction per os, the condition is relatively mild and with the exception of insomnia the withdrawal symptoms wear off in a week or less. The drug

is stopped entirely and immediately and any sedative, analgesic, or hypnotic which contains no opium or derivative may be used. Six or eight weeks are required to rehabilitate the personality of the patient and remove the likelihood of relapse. While no figures are given, it is evident, the author says, that codeine addiction is not uncommon in Germany, although most apt to be encountered in neuropathic-degenerative stock.—Deutsche medizinische Wochenschrift, January 3, 1930.

Parathyroid Tetany and Cataract.-Leslie Cole reports the case of a woman, aged 34 years, who developed tetany and cataract following thyroidectomy at which both lateral lobes of the thyroid appear to have been completely removed. Treatment consisting of a calcium-rich diet (two pints of milk and two eggs), with the addition of 12 drachms of calcium lactate daily, kept the serum calcium between 5 and 8 mg., and the signs within the limits of latent tetany. serum calcium could not, however, be kept at the normal level in a healthy person without the administration of parathormone, which was given intramuscularly in doses of 10, 20, or 30 units twice a day. During one period this was replaced by a dried parathyroid extract by mouth, in doses of 1/5 of a grain three times daily. The dried extract did not have the same effect on the serum calcium as did the parathor-The combined calcium and parathormone therapy appeared to have no effect on the cataract, and prognosis as regards sight apparently depends on the successful surgical removal of the cataracts. When the treatment was omitted the symptoms of tetany returned, so it may prove necessary to give the parathormone regularly in the same way as insulin is given in diabetes. Cole analyzes 38 recorded cases which show that the results of partial or complete removal of the parathyroid glands may be divided into two categories: (1) Alterations in the calcium and phosphate content of the serum associated with signs and symptoms of tetany; (2) changes in the lenses, nails, teeth, and hair. No explanation of these changes has yet been put forth. In the present case it is worth while noticing that there was a rapid increase in the lens opacity which followed an increased calcium diet without parathormone. This observation appears to support Greenwald's evidence that in the absence of the parathyroid hormone there is an extensive deposit of calcium, probably in the form of calcium phosphate, in the tissues, and that cataracts may be due to a deposit of this salt in the lens. As a precautionary measure, it seems to be unwise in severe parathyroid tetany, before cataracts have developed, to give an increased calcium diet without parathormone .--The Lancet, January 4, 1930, cexviii, 5549.

Parrot Fever .- Quite independently of the American visitation, which he does not mention, Professor C. Hegler of the General Hospital, Hamburg, reports two small epidemics of psittacosis. In regard to the first, which appeared in July, 1929, there had been a small epizootic among the parrots in the pet shop of the family afflicted, and a week after the original appearance of sickness in the birds all three members of the family were attacked with a disease resembling typhoid with a complicating pneumonia. Two of the patients succumbed to this infection. An attempt was made to find the Nocard bacillus, but all effort along this line was barren of results. Positive diagnostic points in favor of psittacosis were familial incidence, exposure to the sick parrots, severe course, violent psychic disturbances indicating cerebral metastasis, and pneumonia without marked cough or expectoration. author reported this episode at the time to the Hamburg Health Board. The second small epidemic appeared in November last. The first victim was an elderly man who had owned a Brazilian parrot, although neither at the time nor subsequently had the bird shown any signs of illness. The patient was admitted to the hospital with a diagnosis of croupous pneumonia of an atypical character, thought due possibly to a typhoid infection, but all agglutination tests were negative. Death occurred on the 10th day, the autopsy suggesting an influenza-pneumonia. The exposure to a parrot was not known at the time and the case would have passed unrecognized had not a hospital epidemic developed in the ward with 6 more victims, two of whom were nurses. All bacteriological and serological tests were negative. Three patients succumbed and autopsy threw no light on the nature of the disease which was assumed to be psittacosis, although it is sometimes denied that this is transmissible from one human being to another.-Deutsche medizinische Wochenschrift, January 24, 1930.

A Plastic Operation for Facial Paralysis .--W. O. Lodge describes a procedure designed to ameliorate disfigurement and to ward off impending corneal ulceration in long-standing cases of lower neuron facial paralysis, more especially those due to mastoid disease, or accidentally inflicted during mastoid operations. The procedure consists in grafting three new ligaments into the face, corresponding in position to the inferior portion of the orbicularis oculi, the levator palpebræ superioris alæque nasi, and the zygomaticus major. These sustain the drooping eyelid and the palsied side of the mouth, thus giving a more pleasing facial expression. With the patient under general anesthesia, 2 per cent mercurochrome solution is applied freely to the skin, conjunctiva, and buccal surface of the cheek. probe is passed along the inferior lacrymal

canaliculus, to define its position. The angular vein and parotid duct must also be avoided. Two short incisions are made, exposing the temporal fascia and the internal palpebral ligament, respectively. A third tiny incision is made at the junction of the skin and mucous membrane at the angle of the mouth. Meanwhile an assistant has excised from the outer aspect of the thigh a strip of fascia lata, as long as can possibly be obtained, and 5 mm. in width. This is threaded along a triangular course between the three facial incisions, among the atrophied muscles, with the aid of a packing needle. The internal palpebral ligament and orbicularis oris are encircled en The two free ends are drawn taut and route. woven into the fibers of the temporal muscle. The incisions are closed and the tension is temrelieved with adhesive Lodge concedes that the results are not as good as those obtained by facio-hypoglossal anastomosis in cases of shorter duration, but it has the advantage that the effect is immediate.—British Journal of Surgery, January, 1930, xvii, 67.

Progress of the Cancerous Endemic Among the Population of Paris.—L. Moinson and Th. Stephanopoli state that the generality of clinicians have been impressed with the considerable increase in the mortality of cancer in Paris during and after the war, no other malady having shown a similar activity. These cancer deaths among the fixed population of Paris have been shown to stand in some relation to alternating periods of anxiety and of tranquillity and hope. Statisticians have plotted the mortality from cancer for the past 50 years and have brought out periods of higher and lower incidence which show that the same forces were in operation before the war. During the 50 years the mortality has risen from about 90 to nearly 135 per 100,000 inhabitants but the curve is sharply interrupted at times by high mortality. Thus about 1898 the Fashoda episode and the Dreyfus scandal were attended by a rise to 108. Just before the great war the mortality had reached 110, but was considerably lower than in 1906, when domestic and foreign troubles caused worry. By the siege of Verdun in 1916 it had risen to 124 and with the fall of the franc in 1925 a maximum of 132 was attained. The authors assume that a state of worry and fear acts adversely on the organism through the neuro-vegetative system, giving rise to intoxication with fatigue products. Although the data speak for themselves the authors are not convincing, for the increment in the mortality from cancer during the Verdun period must have contracted their ailment some years in advance of 1916. At the most the mental state could only have accelerated the demise of the sick individuals and the physical hardships and privations of war could have been contributory factors.—Bulletin de l'Académie de Médecine, December 24, 1929.

### CONTINGENT HOSPITAL BEOUEST NOT INTEREST-BEARING

By LLOYD PAUL STRYKER, Esq. Counsel, Medical Society of the State of New York.

A very interesting question was recently presented to one of our Surrogates' Courts in this state. A man was desirous of adding a wing to a hospital as a memorial to himself. For this purpose he bequeathed to the said hospital the sum of \$10,000, upon condition that "within five years of his death, or that of his wife, an additional \$20,-000.00 shall be raised for said hospital and shall be given to it for the same purpose." He further provided in his last will and testament, in the event that such amount was not raised and given, then the entire principal of the bequest, together with any accumulated income should revert to and become part of his residuary estate. residuary estate is given to the legatees (among them being the hospital) in the proportion their respective legacies bear to one another. Upon his death the hospital took steps to raise the specified amount and toward the close of the five-year period was successful in raising the entire sum. In the meantime the contingent bequest to the said hospital of \$10,000 had earned interest amounting to \$2,500. The question presented to the Surrogate for decision was whether or not the hospital was entitled, not only to the \$10,000, but also to the interest it earned during the five years mentioned which it took for the hospital to raise the necessary sum of \$20,000; or whether the hospital as one of the residuary legatees, takes only its proportionate share of the accrued interest.

The facts before the Surrogate disclosed that at all times there were abundant funds to meet the full amount of the legacy to the hospital, and that the delay of five years was due solely to the hospital having availed itself of the limitation of time set forth in the will. In holding that the hospital was only entitled to the sum of \$10,000 plus its proportionate share of accrued interest as resid-

uary legatee and not to the full sum of \$12,500, the court said:

"As to ordinary legacies, the common-law rule, making them payable at death, put the executor in default if he withheld payment until he had ascertained and liquidated the estate; and thus the legatec was deemed to have a right to interest on the legacy from the date of death. The injustice of this was corrected by the statute which gave the executor a year to liquidate and make ready for payment; and thereafter such legacies as bore no interest carried interest from and after the end of one year from the date of death or letters, for that date then became the day when they were due and payable. All legacies, however, do not necessarily bear interest. Cases have occurred where the bequest was of a promissory note that had been made 'without interest'; and also in the same form, but 'payable at my death.' Other legacies are indefinite and such that it could not be said, before judicial settlement, just how much each one would receive. \* \* \*

'When the time for the payment of a legacy is fixed by the will and there are no other controlling considerations, interest is due only from the time designated for payment of the legacy.' \* \* \*

I am of opinion, therefore, this legacy was a gift of \$10,000 and no more; and that it was not payable until the prescribed condition had season-ably been met; and that whenever it thus became payable, it then entitled this legatee to demand only the definite sum mentioned; and that all the interest accurred thereon pending the performance of the condition, does not pass to this legatee either as a matter of law, or as an accessory of this non-specific principal; but must be deemed to have been intended to go to the residuary legatees, including this particular legatee for its proportion with the others."

### CLAIMED IMPROPER TREATMENT OF POTT'S FRACTURE

In this case the plaintiff had for many years been a patient of the defendant. On the occasion involved in this suit, the defendant received a telephone call from a nearby town asking him to call to 'see the plaintiff. Upon arriving and examining the plaintiff the doctor found him to be suffering from a Pott's fracture of the left leg

He was taken to a nearby hospital, and a roentgenologist was called. Cold applications were applied to keep down the swelling of the leg.

On arriving at the hospital, the patient was immediately taken to the X-Ray room, and upon examination a very badly swollen ankle and foot were revealed. The greatest amount of swelling

was about the ankle, particularly on the external aspect of the joint. X-rays of the fracture and the lower part of the leg consisting of anterior, posterior and lateral views were taken. The X-rays revealed a fracture of the distal extremity of the fibula about one and one-half inches from the tip of the malleolus, with external displacement of about one-half to three-quarters of an inch of the proximal end of the distal fragment and a posterior tilting of the distal end of the distal fragment. There was also a fracture of the internal malleolus of the right ankle but very little displacement.

The type and extent of the fracture were explained to the patient and he was advised that he must submit to a general anaesthesia for the purpose of reducing the fracture, also if the fracture could not be properly set an open operation might be necessary. The patient very reluctantly consented to the administration of a general anaesthesia for the purpose of reducing the fracture, but absolutely refused to consent to the performance of an open operation. After the administration of the anaesthesia and in attempting reduction, it was noted that the whole foot was very easily moved in almost any direction while the leg was held steady, which indicated torn capsular ligaments in addition to the fracture. Great difficulty was experienced in the reduction. Finally, it was decided to place the foot at right angles to the leg and invert it slightly internally. During the reduction X-rays were taken in order to check up on the position of bone fragments. While the foot was in the latter position a plaster cast was applied from the toes to a short distance above the knee-joint, and a further X-ray was taken which showed the condition satisfactory. After the plaster cast had hardened the plaintiff was taken to a room in the hospital, the leg propped up on pillows and held by a sand-bag.

The patient was advised that the reduction obtained was the best possible without an open operation, and the patient again refused to consent to an open operation. The following day the patient was taken to his home where, because of other conditions entirely disassociated from the Potts fracture, the patient was seen at least once a day for several weeks.

About one month after the fracture, the cast was removed and the leg found to be somewhat swollen. Massage was prescribed and administered for a period of about four months. For several weeks after the removal of the cast, the ankle was bandaged with cotton bandages. The patient remained in bed for about six weeks and was then able to walk with supports. During the summer, within three months from the fracture, the patient was up and about and attending to his duties. In six months he was able to walk with a slight limp, but without any supports and could walk with a low shoe. The last treatment was rendered about five months after the fracture, at which time the plaintiff had a good result considering the nature of his injury. The foot, however, was inverted and the external malleolus enlarged.

The complaint charged that the defendant physician failed to render proper medical care and attention and that as a result thereof the plaintiff sustained a weak, deformed and abnormal foot and leg and was unable to perform his customary duties without the use of an iron brace and support. The action was commenced about a year and a half after the plaintiff had sustained the fracture and about one year after treatment was concluded. After the action had been pending for over three years the plaintiff voluntarily discontinued it, thus terminating the action in the doctor's favor.

# OBSTETRICS—CLAIMED INJURY TO INFANT'S EAR

The complaint in this case charged that the defendant so negligently delivered a woman that the child sustained severe injuries to her ear.

From the facts it appeared that the doctor in this case was engaged to attend a woman who was pregnant. He gave her the usual prenatal care. On the day of delivery he found the woman suffering from uterine dystocia, and the conditions were such that he was compelled to use forceps in making the delivery. The child was delivered and was normal in all respects, except that there was a condition of caput succedaneum. The mother made an uneventful recovery. The condition of the child cleared up, but left a small haematoma

on the back of the child's head at the parietal bone. Several days after the mother left the hospital the doctor called with a consultant at her home for the purpose of surgically treating the haematoma. The consultant, assisted by the doctor, operated on the child, and the doctor continued to treat the child until the wound had healed. At no time was there any injury to the child's ear, except that a small pimple appeared on the ear which was cleared up by medication.

The plaintiff's attorney examined the defendant at considerable length before trial, and the doctor acquitted himself so well on the examination that the plaintiff's attorney discon-

tinued the action.

# NEWS NOTES

### LEGISLATION

Senate Int. No. 396, Pitcher-Assembly Int. No. 464, Lattin, makes certain amendments in the Public Health Law with regard to state aid. This amendment was prepared by the State Department of Health so as to make the manner of distributing aid to counties conform to the custom in distributing other forms of state aid, as, for instance, through the Department of Education and the Department of Highways. This amendment provides that a county desiring state aid shall have its program approved in advance by the Department of Health and shall file with the Department of Health a statement of the amount of monies expended during the year, by the 15th of December. The advance in this date was made so as to give the Department an opportunity to collect the statements from the various counties and introduce them into the budget, which is supposed to be presented to the Governor before the first of January.

Senate Int. No. 397, Pitcher—Assembly Int. No. 466, Lattin. The Department of Health would amend the Public Health Law with regard to the filing of death and birth certificates. The certificates themselves have been revised, as well as the manner of their filing.

Senate Int. No. 398, Pitcher—Assembly Int. No. 465, Lattin, amends the Public Health Law with regard to the general powers and duties of local boards of health, extending them somewhat.

Assembly Int. No. 494, Doyle—amends the Public Health Law in relation to the licensing of donors of blood for transfusion. Supplying blood for transfusion has grown to be quite a business in some of the larger cities. Persons willing to be donors and who have satisfied the health requirements regarding the condition of their blood, are now being organized by promoters who contract for their services. We are not convinced of the necessity for this measure and will welcome your opinion.

Assembly Int. No. 506, Hanley.—You will recognize this bill, although previously it was usually handled by Mr. Berg of the Bronx. We shall register our opposition to this bill as in the past.

Assembly Int. No. 573, Horn—would revise the Workmen's Compensation Law so as to remove the time limit for physicians filing their bills for services. The justice of this bill is apparent, but we doubt whether it will have the same appeal to insurance carriers.

Assembly Int. No. 646, Lattin, amends the Public Health Law in relation to the maintenance and care of carriers of disease. The state has about five hundred known typhoid carriers, about half of whom live in greater New York City. These carriers are unfortunate in that in spite of the best medical and surgical efforts some of them will always remain carriers, and, therefore, they will be limited as to occupation. In a number of instances this is a real hardship and the state has endeavored to compensate the carrier in part for his loss. Quite a few of the cariers are women. Under the law at present state aid is distributed by the poor director, where such persons still exists, and this has been objectionable in some instances because it gives the appearance that the person receiving the compensation is an object of charity, which such is not the case. This amendment would correct that condition

compensation shall be under the jurisdiction Health.

Assembly Int. No. 647, Lattin-The necessity for this amendment arises from a desire to pay nurses their travel expenses at more frequent intervals than the law at present provides. In most cases these bills can only be paid after the board of supervisors audits the account, and the board's meeting are so infrequent that the nurses are obliged to carry their own expenses. In some instances for more than six months. This is working an unnecessary hardship and the amendment provides a way by which their expenses can be paid more frequently. The amendment also provides for paying the committee who directs the nurses' work, the expenses incurred in attending the meetings. It has been shown that in some instances physicians have traveled more than fifty miles to attend these meetings, all at their own expense. The amendment is introduced by the Department of Health.

Senate Int. No. 533, Schackno—originated in the Assembly—Int. No. 722, where Mr. Post introduced it. He has informed us that he conceived the bill after having talked with an obstetrician in New York City, a friend of his, who impressed upon him the importance of the state taking a greater interest in maternal mortality. He pointed out that in the last ten years there has been practically no change in

this particular mortality rate, while most other rates have markedly decreased. He said that he had discussed the matter with the Department of Health and thought that a commission, such as he has indicated, could add materially to the public's interest in this important problem by the collection of data and such interpretation of the data as it would make. Probably the Governor would name one or more medical men as members of the commission.

Senate Int. No. 625-Mr. Brown has introduced a chiropractic bill which is very similar to the one introduced in the Assembly by Mr. Esmond. We shall offer the same objection to both bills and will do our utmost to see that neither of them leaves committee. Don't forget to advise your legislators with regard to opposition against the three chiropractic bills—two of them by Mr. Esmond and this one by Mr. Brown.

Assembly Int. No. 738—Mr. Gimbrone has introduced a bill which would, permit free choice of surgeon or physician by the injured employee. This, in our opinion, is an important bill and if you are so persuaded, we suggest that you immediately let your legislators know how you feel about it and urge them to support it. It is likely that a similar bill will be introduced on the other side of the House in the next week or so, and we shall hope to get one of them enacted.

It gives us great pleasure to announce that Dr. Grant C. Madill was elected by the legislature as a member of the Board of Regents from the fourth judicial district. Dr. Madill enters upon his new duties immediately.

Assembly Int. No. 938, Dominick-Is a revision of a bill which he had before the legislature last year. Mr. Dominick feels that by creating district infirmaries he can relieve many of the county homes from the necessity of having an infirmary. At present each county home must provide itself with quarters and assistants to take care of the guests who may become ill. In the smaller institutions it may be that at no time will there be more than two or three persons ill and much time might pass when there would be no one ill, yet the institution would be obliged to keep itself in a position to care for those who might be taken ill. The bill, in districting the state, leaves out such counties as have definite infirmaries; for instance, Albany, Erie and Onondaga. In drawing the bill Mr. Dominick has consulted with the Department of Social Welfare.

Assembly Int. No. 871, Cuvillier—This bill was before the legislature last year. The object Mr. Cuvillier has in mind is a worthy one, but whether he has selected the proper way of approaching it is controversial. Will you read the bill carefully and give us your comments?

Assembly Int. No. 855, Doyle-A cosmetic bill has been before the legislature in one form or another for several years. Let us have your opinion on this one.

Senate Int. No. 737, Knight-The county board of supervisors has limited powers for spending money in public health activities. The Department of Health has taken the position that they have no powers except where they are specifically stated in the law, as for instance, the employment of a nurse to take care of crippled children or the appropriation of money to finance tuberculosis clinics. Some counties would like to pay the physicians for conducting anti-diphtheria clinics in the rural districts where there seem to be a need for such clinics, and also to pay the physicians for conducting child welfare clinics and preschool clinics. Wyoming County has appropriated a sum of money to pay physicians to conduct child welfare clinics, and when it was found that the Department of Health disapproved, the money, we understand, was transferred to tuberculosis clinic activities. If this amendment of Senator Knight and Mr. Stockweather should be enacted into law, it would appear that supervisors would have the power to appropriate money for the types of work we have discussed above. The objection the Department of Health raises is that a board of supervisors is not an executive body, but an administrative body.

Senate Int. No. 700, Pitcher—This bill makes a number of important and unimportant changes in the county health law. One of the most important is that which provides a way by which the board of supervisors may finance a county health district after it is authorized and before the taxes levied for its financing have been collected. Another important change is that which provides that a deputy may serve for the county health commissioner; and a third enables the county board of supervisors to pay the expenses of the county health district when such county does not have a county auditor.

### PUBLIC RELATIONS COMMITTEE—LETTER NO. 2

A few weeks ago Dr. Sadlier addressed a group of chairmen of health committees of women's clubs, in New York City. Following this, the chairman of the Summer Round-Up Committee of the Parent-Teachers' Association of this State asked for the cooperation of the medical men of the State in promoting the round-up campaign.

This campaign undertakes to give all children who expect to enter school in the fall a physical examination, in order that defects found can be corrected or the correction begun before the opening of school. It hoped that the family physician will be willing to cooperate by making

these examinations.

Commissioner Wynne, of New York City, has stated that out of twenty thousand children newly admitted to the schools of Queens County this year, nearly four thousand came with a certificate of a medical examination by their family physician. The Public Relations Committee has sugested to the Parent-Teachers' Association that where children of parents have no family phy-

sician, a public clinic be held and that the county medical society be asked to recommend physicians to do the work, and that they be paid as physicians have been paid for service at diphtheria immunization clinics.

The Committee on Public Relations advises that the family physician record his findings on the blanks submitted, so that there will be no difficulty in the acceptance of these reports by the school physician. The Public Relations Committee thinks that it would be well for your committee to take a real interest in the round-up campaign, both for its intrinsic value and its value as a stepping stone to the readjustment of relationship of the medical profession to public demand.

The Public Relations Committee will greatly appreciate any suggestions that you have on this subject, and will be glad to hear from you at your earliest convenience.

W. H. Ross, Secretary, Committee on Public Relations.

### PHYSICAL THERAPY APPARATUS

The Committee on Physical Therapy and the Committee on Medical Economics have issued the following joint statement for the information

of the medical profession.

"Both Committees believe that physical therapy performs an essential part in the practice of medicine and should be given the same consideration as any other division of the healing art. The Committees, however, deplore the aggressive sales methods of a few irresponsible and unethical manufacturers or of sales agents, which induce a good many physicians to spend a disproportionate amount of money for apparatus which they do not need and whose uses are too often unknown to them,

"The Committees, therefore, emphatically recommend that no physician buy any piece of expensive apparatus or install a whole set of apparatus without an adequate preliminary course of instruction under recognized medical auspices, so that he may himself determine what the needs of his particular practice are, and thus be guided in how much he should invest in covering his actual needs."

### JOINT MEETING OF PHYSICIANS AND DENTISTS

The marked extension of the fields of practice common to medicine and dentistry, witnessed by the past decade, has created a growing need for a closer relationship between the two professions.

Recognizing this and to promote such closer relationship, the Medical Societies of the Counties of Kings and of Queens and the Second District Branch of the Dental Society of the State of New York have arranged a joint meeting to be held in the building of the Medical Society of the County of Kingsi 1313 Bedford Avenue, Brooklyn, New York, during the afternoon and evening of March 10, 1930.

For this occasion, there is being gathered from throughout the country the best available talent for the program, so as to present to the physician and to the dentist various imporant phases of medical and dental interdependence. A medicodental meeting on such a large scale is pioner in character and, it is believed, will do much for the progress and development of the inter-rela-

tionship of the professions.

The immediate future will surely witness a more intimate relation of medicine and dentistry and an extension of co-operative movements which promise to become National and even International.

The effect of such a co-operative movement upon the practice of Medicine and Dentistry both in this country and throughout the world will be most profound and far reaching and will benefit countless millons by the better service each of the professions will be enabled to render.

The following program has been arranged. Each of the subjects will be presented from the physician's and from the dentist's viewpoint by a member of the medical and of the dental professions and the discussion of each will be opened

by a physician and by a dentist.

#### AFTERNOON SESSION:

- 1. Subject—The Co-operation of the Physician and Dentist the Recognition of Disease.
- 2. Subject—What Justifies the Dentist and the Physician in Advising the Extraction of a Tooth?

#### **EVENING SESSION:**

3. Subject—Oral Conditions and General Health.

Between the afternoon and evening sessions, there will be dinner at the Unity Club wih brief addresses from eminent members of the two professions.

A cordial and urgent invitation is extended to all practitioners of medicine and dentistry to attend the meeting called for March 10 to arouse the interest and set into operation the activities of Local, State, National and International Medical and Dental organizations along co-operative lines.

#### WOMAN'S AUXILIARY COURSE IN PUBLIC HEALTH

The Woman's Auxiliary of the American Medical Association has issued a course of study in public health for the guidance of the Auxiliaries of County Societies. Since the course is simple and practical, it is here reproduced for the benefit of any group that is planning a course in public health.—The Editors.

Fundamental Principles: Fundamentals upon which the Woman's Auxiliary work for improve-

ment of public hygiene should be based:

(1) Recognition of the fact that public health work is a highly technical job, requiring scientific, technically trained workers. That health work undertaken by lay women with no knowledge of the public health problem as a whole is necessarily fragmentary and ineffective.

(2) Recognition of the fact that every state, county and city is entitled to a scientific full-time health department (organized not to treat the sick, but to prevent disease and promote health), adequately financed, free from political domination, and providing continuity of service to a trained personnel so long as work is efficient.

(3) Recognition of the fact that the first and most fundamental job for lay organizations like the Auxiliary, is to secure such scientific full-time health departments and adequate health protection, in their state, their county, their city or town

(4) Recognition of the fact that where efficient, full-time, scientific health departments do not exist (and only about ten per cent of the rural districts of the United States have anything approaching adequate health protection), health activities must be initiated and carried on by volunteer unofficial agencies; but that all such work should be so planned and administered as

to serve as stepping-stones toward the full-time official health department, and that when the full-time official health department, with workers trained for public health work, has become an accomplished fact, lay organizations should support and cooperate with the official workers and should be willing to take orders from them.

(5) Recognition of the fact that no health department, state, county or city, can do effective work without intelligent cooperation of the public; that such public cooperation depends upon wide-spread health education; that lay organizations can do this educational work, and are needed for it; and that the Auxiliary can be one of the most valuable tools for an official health department to use in this work because it can, by its education of the public concerning the official health department's work and needs, be the means of gradually eliminating or preventing political interference with an efficiently working department, and thus insure to it uninterrupted public service.

Most volunteer agencies do not yet realize the wastefulness of their individualistic efforts. One of the first things the Auxiliary should do is to work for a change of attitude in other volunteer women's organizations.

Health officials know that the work which makes the greatest emotional appeal to the public is not always that which most needs to be done. Unfortunately most women do not know this. This is something the doctors' wives might well undertake to teach other women.

The National Auxiliary recommends, therefore, that each State Auxiliary undertake, under the direction and with the help of the Public Health Committee of the State Medical Association and

of its Advisory Council a study along the following lines --

1 The fundamental principles of health pro

motion and disease prevention

2 The set up considered essential by public health experts for an effective state health de partment, of qualifications of personnel, adequate budget, and the like

3 The state health conditions

It shall devise means of acquainting all the state board members with the result, and make recommendations for educational work by the county Auxiliaries based upon the conditions found

In states where all is well, and where time has developed good official health machinery and good health conditions, general knowledge of the fact will tend to prevent interruption of the excellent work, and will be a source of satisfaction to the women of the state

In those states where there is much yet to be done, this investigation will indicate what sort of work needs doing first. For example

(a) In those states which are not in the Birth Registration Area, the Auxiliaries would, without doubt, wish to tackle, as their first job, the ninety

per cent birth registration problem

(b) In those states in which the state health department believes the "County Health Unit" to be the solution of the rural health problem, the county auxiliaries should be encouraged to take as their clief work such persistent and wide spread education of the public as will gradually create a general demand for the full-time county health department

(c) In those states where the rural health work is directly done "long distance" by the state health department, the county auxiliaries, if will ing to work, and work under the directions of the state health department, can carry on intensive local health education work which would be impossible for the state department without intelligent local cooperation

Outline of Study — To those auxiliaries which agree with these ideas the committee recommends

the following outline of study

#### I PUBLIC HYGIENE

(1) Vital Statistics Their value

Compare the vital statistics of the state with those of other states

Compare the vital statistics of the different counties of the state

Compare he vital statistics of the cities with other cities in the state, and in the United States

(2) The State Health Department, its organ iradion, and program

- (a) For general state work
- (b) For cooperating with the counties in improving county health conditions
- (3) The value of the Public Health Nurse
- (4) The County Health Unit as a possible solution of the rural health problem
- (5) Community wide conditions which affect health
  - (a) Milk

Milk standards, why necessary, what milk standards your community needs How are these needs being met?

(b) Housing

Your community housing laws Housing conditions as they have developed under these laws and as they affect health

Improvements needed

(c) General Sanitation and its relation to the death and morbidity rates Sewage disposal

Water

Garbage

Flies

Dust and street cleaning, etc

#### PERSONAL HYGIENE

The improvement of personal hygiene in any community is almost entirely a matter of education. Here again the Auxiliary members must first educate themselves before they can take a safe part in educating the public. The committee therefore recommends that the Auxiliary study programs shall include such subjects as

Health Promotion

Prenatal care

Child Welfare

Infant and pre school hygiene

School hygiene

Mental hygiene

Social hygiene

The advantage to the public of general compliance with health regulations

The periodic health examination

Control of communicable diseases

The entire program should close with a survey of all the private agencies doing health work in the community, and a discussion of the possibility and desirability of centering the direction of all such work in a full time, scientific health department, under which the private agencies, while still maintaining their identity, would work in complete cooperation

# THE DAILY PRESS

#### CHIROPRACTIC CONVENTION

The Chiropractors held a convention in the Hotel New Yorker, New York, on February 5, which was addressed by B. J. Palmer, son of the founder of the Cult. This address as reported in the Herald Tribune of February 6, reminds us of the studies in chiropractic printed in this Journal in 1924, especially those in the August to December numbers. The Herald Tribune reporter caught the spirit of our own medical journal when he wrote:

"'B. J.' as they affectionately call him, is a middle-aged scientist, with long, glaced hair. a Vandyke beard two special fountain pen pockets in his waistcoat and a large red monogram on his right shirt sleeve. He lectured in his shirtsleeves, partly for his own ease and partly to make everyhody feel at home. His long hair was natily caught up by an elastic which extended from his forchead around behind his ears, which prevented his mane from staggering down his back. It was sheared off neatly at the "fourth dorsal," to use a phrase from his own science.

"His neurocalometer or nerve meter, is an apparatus which you adjust to a vertebra and it shows whether the nerve impulses are flowing freely or are being interfered with. It shows exactly at which joint the chiropractor should hurl himself to cure appendicitis, athlete's foot, hives, talking to one's self in the subway, opinionatedness or ears that stick out.

"The evils which 'B. J.' denounced unsparingly included overadjustment of the spinal column, failure to take advantage of the apparatus which science had provided for the chiropractor, and a sneaking, lying air in going after big fees.

"The evil of a slinking, hangdog deportment in leading up to the mention of an exceptionally stiff figure was the result of knowing that you were a liar all the time, according to 'B. J.' who said the only way to do was to believe 100 per cent in yourself at all times and have the fullest confidence in any statements you might feel moved to make.

Palmer was quoted as saying:

"It's a question of salesmanship but the trouble with you fellows is, you're trying to tell your patient something and expecting your patient to believe something you don't believe yourself.

"You want to step up your results. I know you do and it's only right you should, and I am now making it possible to help you. Now, I have 50 neurocalometers up in my room—and Mabel is up there and is perfectly willing to take away from you—so long as those neurocalometers last—150 simoleons each, so that you can take those neurocalometers home and begin to build up your business."

The reporter continued:

"The inventor said that the apparatus frequently enabled the operator to tell that a patient was improving when he couldn't tell it himself.

"The convention passed by unanimous vote a resolution opposing all legislation that made it a workhouse matter to practice chiropractic or interfered in any way with the free exercise of the healing science. Books and pamphlets were on sale at the meeting exposing what was termed a giant conspiracy on the part of the medical profession to deprive the sick and suffering of the vital benefits of chiropractic."

#### HEALTH SERVICE IN NEW YORK CITY

The larger the city, the more complete and efficient is its health service. The New York Times of February 10, comments editorially on the free health services of New York City and

"An imposing volume, 'A Health Inventory of New York City.' has just been published by the Welfare Council of New York City. It is the first comprehensive study of all the organizations working for the improvement of the public health, and it was issued in the hope of making further effort along these lines more efficient. Health services are so numerous and have grown so rapidly both in numbers and in scope that the workers engaged in one field have not been able

to keep track of similar and perhaps overlapping labors in another. Some notion of the extent of the work may be gained from a consideration of the agencies omitted from the survey.

"The inventory is confined to 'organized efforts at rendering personal health services to individuals.' This compels omission of all such work done by nurses and physicians working privately.

"Astonishing as it is to learn of the enormous volume of health-promotion work done by the 818 clinics in this city, it is even more surprising to realize how small it is in proportion to the curative work. New York spends about twenty times as much money on the care of the sick as on the prevention of sickness."

It is a characteristic of health agencies operated by the City and lay organizations that every item of work is recorded. It is equally characteristic of physicians doing private practice that they do not keep or publish statistics of the number of cases that they treat or of the cost of the treatments. This is reflected in the immense amount of labor and time which the National Committee on the Cost of Medical Care will expend in order to get reliable information; and when the Committee gets it, most physicians will probably doubt the figures because they have no idea how they apply to the families in their own care

295

#### NEGRO PHYSICIANS IN NEW YORK CITY

The daily papers of February 14 comment on the action of the Commissioner of Hospitals, Dr. J. G. William Greeff, in opening the staff of the Harlem Hospital to negro physicians. The largest negro "City" of the World is in Harlem, there being over 150,000 of the colored race in that section served by the Harlem Hospital, which is conducted by greater New York City. The New York Herald Tribune of February 14 says:

"There are in Harlem about 125 Negro doctors, with first class professional training, graduates of Howard University or the standard white medical schools. They are not yet patronized as fully as they should be by their own people. Many of the Negroes go to white doctors, not all of whom are a credit to their race. Most of the Negro physicians, combining sound skill with warm personality and sympathy, are splendidly

fitted for their profession.

"Dr. Greeff said last night that this step, the first to be taken in the only city hospital in the Negro section to recognize the importance of Negro doctors by raising them to posts of responsibility on a basis of equality with white doctors, might have far-reaching results. White physicians will still outnumber the Negroes, but if the present plan is successful further promotion of Negroes on the staff may result.

"Dr. Greeff said there were Negro physicians on the staff who were capable and deserving of filling the responsible places which may be laid open to them under the new plan, adding that he believed there were enough now to occupy the positions that are ready for them.

"Dr. Greeff's statement on the reorganization

reads as follows:

"'Today the medical board of Harlem Hospital was reorganized and will meet in my office at 10 a. m. tomorrow and elect their officers. This reorganization of the medical board was based upon a survey and report made by a committee, of which Dr. George David Stewart was chairman. This committee made an exhaustive inquiry into conditions and devoted much time and thought to their work and I desire here publicly to acknowledge my gratitude and appreciation to its members.

"'This action was taken by me in the interests of better service at the hospital. I was also influenced by the desire of the Mayor to give to colored physicians full and equal opportunity for hospital training and experience. In this matter the Mayor has taken the most advanced position of any public official in the United States. In no other city in the country do colored physicians enjoy the opportunity that is theirs in this city."

#### PILLTAKING CHAMPIONSHIP

The New York Herald Tribune of February 13, has an editorial on the holder of the record for taking the greatest number of pills, which says:

"There once lived a man named Samuel Jessop, says The London Lancet, who in twenty-one years took 226,934 pills and 40,000 bottles of medicinal mixtures. Whoever kept count evidently was more careful of pills than mixtures and recorded the latter only in round numbers. In the year 1814 Mr. Jessop, somewhat more pill hungry than usual, piled up what The Lancet believes to be a record. Within that twelvementh 51,590 of the medical buckshot rolled down the Jessopian esophagus. This seems to be the world's greatest pill-swallowing feat to be listed with the accomplishments of the man who drank forty-five cups of coffee, with the individual who rolled a peanut up Pike's Peak with a toothpick, with the recent luminary who sat longer than any one else atop a flagpole and with other devotees of freak contests. Another medical worthy, *The Lancet* continues, almost deserves to rank with Jessop and his pills. This was Mr. David Hartley, who ate

200 pounds of soap.

"Medicine has much in common, anthropologists always have insisted, with magic. Taking a pill is still more of a ritual act, it is probable, than an act of reasoned common sense. It would be interesting to have a census of the numbers of pills and other medicines swallowed today as compared with the per capita doses in Samuel Jessop's day or in the still earlier age of powdered munmy. We venture that medicine taking has slackened little, in spite of the urging of modern physicians that cures are to be wrought more by attention to habits and hygiene than by powders and pills. There may even be unsung champions alive today who have swallowed in a year more pills than Jessop's record of 51,590."

1.7. 1.3

# OUR NEIGHBORS

#### FEDERAL INCOME TAX

The January issue of the Wisconsin Medical Journal contains a five page article on the application of the provisions of the Federal Income Tax Law to physicians. The article was submitted to the Federal authorities and approved; and it is therefore as authoritative as any general article can be. Physicians in New York State will be especially interested in the following list of depreciations and deductions:

#### Depreciations Allowed

Automobile-Professional use.

25% cost price.

Classification includes snowmobiles.

Instruments:

20% of purchase price surgical instruments.

Library:

10% on medical books.

Office:

10% cost furnishings and fixtures.

#### Deductions

Automobile-Professional use.

Cost of upkeep.

Cost of repair. Salary of Chauffeur.

Debts

Dues-Professional.

Any paid in interest of business or profession:

County Society.

State Society-\$10.

Special Societies.

College of Surgeons.

College of Physicians, etc.

Fire-Losses by.

Insurance premius:

State Medical Defense, \$2.

Other Malpractice policies.

Auto—Public liability:

Auto theft.

Auto fire.

Theft of professional equipment.

Fire-Professional equipment.

Lawsuits:

Expense in defending malpractice suit

Library:

#### THE COMMONWEALTH FUND IN INDIANA .

Public Health Foundations such as the Milbank and the Commonwealth Funds, are substituting educational work for that of subsiding "Demonstrations." The January issue of the Journal of the Indiana State Medical Association says:

"The following letter received from Director of Division of Public Health of the Commonwealth Fund, New York:

"For the information of members of your so-(Continued on page 298—adv. xvi)

#### INFANT DIET MATERIALS

Dextri-Maltose

•

#### Dextri-Maltose for Modifying Evaporated Milk

In sections where fresh cow's milkis not readily available, physicians often rely upon evaporated milk forinfant-feeding.

Destri-Maltose is as important for modifying evaporated milk as it is, for fresh cow's milk, supplying the correct proportion of carbohydrate without nutritional upset to the baby.

The assimilation limit of Dextri-Maltose is twice that of cane or milk, sugar. Dextri-Maltose is absorbed high in the intestinal tract, so that it is least likely to cause fermentative diarrhea and nutritional disturbances.

5 LU TINS AT DRUGGISTS SAMPLES AND LITPRATURES A

# Dextri-Maltose for Modifying Lactic Acid Milk

In using lactic acid milk for feeding infants, physicians find Deatri-Maltose the carbohydrate of choice:

To begin with, Dextri-Maltose is a bacteriologically clean product, unattractive to flies, dirt, etc. It is dry, and easy to measure accurately.

Moreover, Destri-Maltose is prepared primarily for infant-feeding purposes by a natural diastatic action.

Finally, Dextri-Maltose is never advertised to the public but only to the physician, prescribed by him according to the individual requirements of each baby.

ciety there is enclosed an announcement of a new project in the field of public health to be undertaken by the Commonwealth Fund begin-

ning January 1, 1930.

"This project will involve close cooperation with the State Health Department in each State selected. An identical announcement has therefore been sent to the State Health Officer in Indiana and also to the deans of the medical schools. We are sending it to your society because we desire that the medical profession have complete information regarding this new project for it is our belief that sound public health work depends very largely upon the cooperation and understanding of the medical profession.

"The objects of this fund, as set out in a pamphlet accompanying the letter, follows:

- 1. The establishment, under direction of the State health department, of a field unit for the purpose of organizing and improving county or district health service in rural communities.
  - 2. Medical Education.
- (a) Assistance to a Grade A medical school which sends a reasonable percentage of its graduates into the State in question; to develop courses in preventive medicine, and to provide special facilities and opportunities for postgraduate work by rural physicians. The appropriation for the teaching of preventive medicine is planned not to exceed \$10,000 per year, and that for postgraduate facilities not to exceed \$15,000 per year.

(b) The establishment at the same medical school of a scholarship or loan fund for the use of not less than five students from the State in question who agree to go into rural practice in that State for a stipulated period after graduation

(c) The establishment of postgraduate fellowships for physicians in each State.

3. The establishment of one or more postgraduate fellowships for public health nurses.

4. Health education. Assistance to the State normal schools, or other teacher-training institutions, in providing facilities for the training of teachers in the purposes and methods of health education."

# ACTIVITIES OF THE IOWA STATE MEDICAL SOCIETY

The first article in the January issue of the Journal of the Iowa State Medical Society is a letter from the President, Dr. John H. Peck calling attention to the activities of the Society. The two which he emphasizes is popular medical education and graduate education of physicians. The President says:

"The Lay Education Bureau has a splendid

future for service as soon as the numerous lay organizations discover that we are in a position to furnish interesting and authoritative health information. These addresses are planned for all sorts of audiences. Talks at high school assemblies are no doubt the greatest opportunity for mass instruction. Such audiences are composed of persons of even age and similar intellectual attainments. Young people are usually very appreciative of a well presented message of health. Even modest stimulation of invitations for these talks invariably brings a good response.

"The State University College of Medicine is now ready to give extramural postgraduate instruction in gynecology, obstetrics and pediatrics upon specific invitation of the county medical society. These courses are carefully planned to be of the maximum benefit to the general practitioner. It is hoped that many counties will request this clinical work very soon."

The second article is by Dr. O. J. Fay, Chair man of the Board of Trustees, who discusses the work of the Managing Director as follows:

"The Board of Trustees feels that the conduct of society affairs during the past year under a full-time Managing Director fully meets their expectations, and that the money spent for his salary is fully justified in accomplishment.

"The Managing Director's work is divided almost evenly between four activities, Journal, Legislation, Business Manager, and Executive Secretary. By the terms of his employment, the Managing Director was to act as assistant to the editor and to take charge of the business affairs of The Journal. The year preceding the employment of a Managing Director, Journal and reprint charges were approximately \$1,600 more than our income. During the first year under a business management, this deficit was turned to a profit of \$100, so that the society made an actual gain of \$2,600 on this one item alone.

"During the three months of the Forty-third General Assembly, the Managing Director devoted most of his time towards furthering the enactment of needed laws, working under the direction of the legislative committee.

"Various economies in the handling of records, purchasing of printing, etc., have been effected; and the income of the society has been increased through the securing of additional members (about \$500) and the conduct of the annual session, especially the commercial exhibits, which will bring the state society a return of between \$500 and \$1,000.

"As assistant to each of the officers of the state society and as executive secretary to the boards and standing committees, the Managing Director has rendered a most valuable service to

### How could we get along without

the Canned Fruits

Canned fruits add health and variety to every diet and menu

JUST LOOK at the wonderful assortment of canned fruits, jellies, jams and relishes every grocer offers you. You are always able to get just what you want at a nominal cost.

Modern science has been used by the canner to bring the finest fruits to you cooked to uniform perfection. And sugar plays an important part in such results.

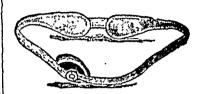

Every cook should cultivate the habit of using sugar as a flavorer. Often fresh vegetables, such as corn, tomatoes, peas, carrots and string beans need a dash of sugar to restore their sweetness. In making them more palatable, everybody is eager to eat what they need of these foods. This is especially true where children's meals are concerned. Can you blame a child for shying at an institi vegetable, a too-sour fruit tened cereal?

This is one of the advertisements of The Superins Intitute, appearing in newspapers Sugar Institute, appearing in newspapers throughout the country. In order to keep throughout the country. In order to keep throughout the country. In order to keep throughout the country in accord with modern throughout the country in the superins when the superins the superins authorities in the field of human nutrition in the United States.

the society. The Scientific Program Bureau, under his management, is assisting county societies in arranging programs, while the Speakers Bureau is sending members of the state society to speak before lay organizations so that fewer faddists will be pressing their propaganda from the platform. A large amount of important clerical and detail work is being done for the various standing committees, especially those on Medical Economics and Medical Education and Hospitals.

(Continued from page 300-adv. xviii)

"The important fact is that these services have cost us nothing, since the increase in revenue as outlined has taken care of the increased expenses. The society lived within its income during the year ending April 30, 1929, and had a surplus

of \$2,000."

# EXTENSION OF ACTIVITIES IN WISCONSIN

The December and January issues of the Wisconsin Medical Journal record the visits of the Lay Secretary, Mr. J. G. Crownhart to several county societies in order to explain a proposed increase of dues, in the State Society, for the purpose of expanding the activities of the State Society. In reply to our request, Mr. Crownhart wrote the following explanation of his visits:

"Early in 1929 the council of the State Medical Society voted to recommend to the 1929 session of the House of Delegates an increase in State dues from \$10 a year to \$15 a year. This question was referred to the 1929 House of Delegates and by them re-referred to the fifty component county medical societies. As secretary of the State Society I am now visiting each of the fifty county medical societies in this State this year, explaining in some detail, neither advocating nor defending, the proposal to the council. The item to which you refer represents the action of the various county medical societies on the question of instructing their delegates for the 1930 session of the house.

"Assuming that you are not interested in all details of the proposed extension in the work as suggested by the council, the essential points

are listed as follows:

(a) Employment of an assistant secretary.

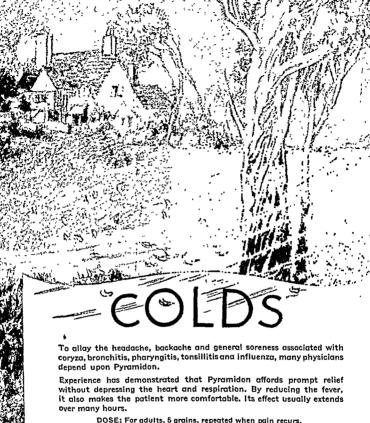

(b) A small appropriation to assist in the organization of a women's auxiliary.

(c) A small appropriation for additional supplies, additional office room, and additional expenses of the delegates to the A.M.A.

(d) An appropriation to provide for a State meeting once a year, of the officers of all official and non-official public health agencies in the State.

(e) An added appropriation to the committee on public policy.

(f) An appropriation to pay rail fare for additional council meetings each year.

"In general, the present budget of this society is approximately \$21,000 a year. If the dues were increased, the budget would approximate \$30,000 a year. It is this question which I am submitting to the county medical societies at the request of the House of Delegates, for ascertaining the inclination of the members and for the guidance of the officers of the State Society."

# HEALTH DEPARTMENT AND THE MEDICAL SOCIETY IN OHIO

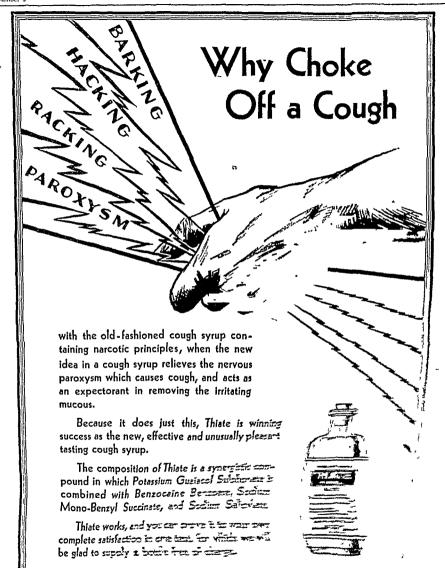

The February issue of the Ohio State Medical Journal has an editorial commending Dr. F. R. Dew, health officer of Belmont County, for his cooperation with the physicians. The editorial reads:

"In connection with the December issue of the monthly bulletin, published by the Belmont County Health Department, Dr. Dew sent out a supplement especially for the physicians of the county. After expressing his appreciation for the support his department has received from the medical profession and extending the season's greetings, he printed the list of newly-elected officers of the Belmont County Medical Society; admonished the members that annual dues should be paid at once; urged more general and more regular attendance at meetings of the society; outlined the program of a recent joint medicaldental meeting; called on physicians to contribute articles and suggestions for the betterment of public health in the county; and made a suggestion or two regarding immunization against diphtheria and the reporting of communicable diseases.

"Dr. Dew's policy of outlining his program to the physicians of his district; asking them for views and criticism of the work in progress, or suggestions for future activities, and calling for the support and cooperation of the medical pro fession in the health work of the community, is certain to give Belmont County a high-type, efficient and result-producing public health administration. Such methods are necessary to the advancement of public health work in every county of the State.

"In the opinion of the Ohio Health News, publication of the State Department of Health, this plan of Dr. Dew's is one of the most forward pieces of work for strengthening relations between the medical profession and the official health agency that has come to the notice of O. H. N. and Dr. Dew is to be congratulated that he has pioneered the way."

"That publication makes the suggestion that other health commissioners who issue bulletins 'may well do likewise.'"

#### HEALTH EDUCATION WEEK IN GEORGIA

The January number of the Journal of the Medical Association of Georgia contains the following announcement of a Health Education Week:

"The first week in May has been designated 'Health Education Week.' One hundred cities and towns in the State have been chosen as centers for holding the public meetings on health education. The State Board of Health. the two medical colleges and the Georgia Tuberculosis Association are cooperating with the Medical Association of Georgia in putting on the greatest health education ever conducted campaign Replies have already Georgia. been received from more than ninety per cent of the secretaries of the county societies which have been tentatively selected as centers for the lectures. This work will be done only under the supervision and with the full cooperation of the respective local societies.

#### PUBLIC APPEAL OF THE MAINE MEDICAL IOURNAL

The editors of the Maine Medical Journal believe that their Journal will have a public appeal as is shown by the following editorial in the January issue:

"Although the Journal is a Medical publication-and its chief appeal is properly to the Profession, it should be of considerable interest to the public. Many matters are being widely discussed today in State Medical Journals that are of vital interest to every citizen and it is our purpose to find space to discuss some of these more general topics. Social Service. Public Health, Modern Hospitals, the cost of Medical care, the cost of Nursing, the Education of the nurse, are all subjects which are engaging the attention of the world today,"

"This number is on sale at the Central News Stand, Brickett & Rands, 664 Congress Street, Portland, Maine.'

#### RESEARCH BY DRUG MANU-**FACTURERS**

Huxley held that science was nothing but trained and organized common sense, differing from it only as a seasoned veteran differs from a raw product.

Few great achievements represent perfection at the time of their inception. A boundless debt of gratitude is due the long list of men who have contributed so materially to the prolongation of life through discoveries of disease causation and cure. to the names of Pasteur, Holmes, Semmelweiss,

Behring and Nicolaier might be l added a host of contemporary scientists who have benefited by the work of these great pioneers in improving the principles upon which their early efforts were based.

Research organizations such as that of Eli Lily & Company deserve much credit for perfected methods of refinement and concentration of antitoxins. From these Indianapolis laboratories came the first largescale production of Iletin (Insulin, Lilly); also the highly practical Ephedrine Products, made possible through the work of Chen and his associates on a drug that has been known for half a hundred centuries. To these achievements might be added the production of Liver Extract No. 343, based on the studies of Dr. Minot and his co-workers.

Eli Lilly & Company's great progress is in a large measure due to research in the field of medicine, and to the fact that the company seeks recognition for its products through professional channels only. are few scientific discoveries that are entirely original, but valuable improvements in form and refinement are countless, and are significant of the progress of our time.

See page xiv-Adv.

#### THE PHYSICIAN'S POLICY IS MEAD'S POLICY

Messrs. Mead, Johnson & Company, in addition to producing dependable Infant Diet Materials such as Dextri-Maltose, have for years been rendering physicians distinguished service by rigidly adhering to their well-known policy which is

the following:
"Mead's Infant Diet Materials are advertised only to physicians. feeding directions accompany trade packages. Information in regard to feeding is supplied to the mother by written instructions from her doctor. who changes the feedings from time to time to meet the nutritional requirements of the growing infant. Literature is furnished only to physicians.'

Every physician would do well to bear in mind that in this commercial age, here is one firm that instead of exploiting the medical profession, lends its powerful influence to promote the best interests of the medical profesison it so ably serves.

See page xv-Adv.

#### KNOX GELATINE

You undoubtedly know that many eminent physicians have written much on the value of gelatine as an aid to the digestibility of cow's milk for babies.

It has ben proved by actual test sation and cure. And cases time and again that the addi-of Pasteur, Holmes, tion of 1% of Knox Sparkling Gela-koch, Metchnikoff, tine to the baby's milk reduces stom-

ach disturbances and helps to increase weight.

Knox Gelatine is an excellent protein-uncolored, unsweetened, unflavored, unbleached. It has been prescribed by the medical profession for more than forty years in cases of infant malnutrition. Be sure you specify Knox Gelatine—the real gelatine-when you prescribe gelatine.

The following is the formula prescribed by authorities on infant feeding: Soak, for about ten minutes, one level tablespoonful of Knox Sparkling Gelatine in one-half cup of milk taken from the baby's formula; cover while soaking; then place the cup in boiling water, stirring until gelatine is fully dissolved; add this dissolved gelatine to the quart of cold milk or regular formula. See page v-Adv.

#### GOLD RADON IMPLANTS

Removable gold radon implants are now available to the Medical profession. Unlike the gold implants previously procurable these are under permanent seal so that there is no possibility of leakage of radon. Moreover they are fashioned in such a way that the ends are perfectly smooth-no rough and jagged edges to traumatize the tissues or cause irritation in those cases where it is decided to leave them permanently in position. Inasmuch as irritation is regarded as one of the most potent predisposing factors to the establishment of malignancy, the avoidance of any form of treatment which has even a remote possibility of inducing it, is of paramount importance in preventing recurrence. With such a means of application the uses of radon can now be greatly extended. The implantation method is steadily supplanting other forms of administration, inasmuch as it is adaptable to a multitude of situations where no other form of application is possible. Screened with 0.3 or 0.4 mm. of gold, practically all caustic action by Beta radiation is eliminated, while the deep penetrating, short-length gamma radiation—upon which the radium therapist depends to produce results-is unimpeded.

Radium, in the convenient adaptable form of radon implants, can no longer be regarded as a "last resort"—to be employed when surgery and all other methods prove futile or impossible. It is now used alone in many situations where surgery a few years ago would have been deemed the only effective method, and even where surgery is still the main reliance, the wisdom of bringing in radium implantation as a postoperative auxiliary, is acknowledged on all sides. In the form at present available the field of its usefulness seems likely to be indefinitely extended, and the entire science of radium therapy has received a new impetus which will place it on a par with any other therapeutic methods now known to medicine.

See back cover.—Adv.

#### A COMBINATION MATERNITY GARMENT-SOMETHING ENTIRELY NEW

Ready now for your approval. It embraces all therapeutic requirements and provides a perfect ensemble for the woman who prefers the "all-in-one" garment. Reinforced lower portions provide firm support to the lower abdomen. The cup-form bras-siere, with inner sling, gives uplift to the breast. A flexible upper front gives softness and with side lacings allows for figure increase. Habit back, well down over gluteus muscles, with Camp Patented Adjust-ment for splendid sacro-iliac sup-Write for our Physician's manual. See page xvi-Adv.

#### ADREPHINE (P. D., & CO.)

Adrephine, Parke, Davis & Company, is suggested to physicians for use as a topical application when preparing the patient for rhinologic examination; for shrinking swollen or congested turbinates; for establishing drainage in cases of sinus occlusion from congested membranes; for its astringent effect in coryza, hay fever, or other nasal, pharyngeal or laryngeal inflammation; for toning up the voice and clearing the

head in cases of "relaxed" throat in public speakers and singers; and for the relief of conjunctivitis or the eye symptoms of hay fever.

It may be applied by spray or directly on gauze or cotton pledgets (in shrinking turbinates, for example), and in very young children it may be desirable to drop it into the nares with a medicine dropper Should a sensation of undue dryness or local discomfort of any kind follow the application of the undiluted Adrephine, water may be added to the mixture for subsequent application. See page xxxvii-adv.

#### BELLAFOLINE "SANDOZ"

Contains in pure form all the therapeutic principles of belladonna leaves and is more constant and more stable than belladonna tincture, a preparation often lacking in dependability. Bellafoline is twice as active as atropine in doses of equal toxicity and is, therefore, more suitable for long continued treatment so often necessary in cases requiring belladonna or atropine therapy. It has no narcotic effect and acts solely by moderating vagus functions and not through general depression of the nervous system. Its indications are those of belladonna generally: vagotonies, spasm, hypersecretion.

Bellafoline "Sandoz" is marketed in

tablets and solution for oral use (dose: 1-2 tablets, or X-XX drops solution, 3 times daily), and in ampules for sub-cutaneous use (dose: 0.5-2 cc. per day). —See page xiii.—Adv.

#### MAGNESIA-MINERAL OIL

Perfectly emulsified, palatable, unflavored, producing no disturbance of digestion, rarely if ever inducing "leakage," Magnesia-Mineral Oil (25) formerly Haley's M-O Magnesia Oil, is indicated and has been endorsed as effective and satisfactory by thousands of physicians in the treatment of Gastro-intestinal Hyperacidity, Fermentation, Flatulence, Gastric or Duodenal Ulcer, Constipation, Autotoxemia, Colitis, Hemorrhoids, be-fore and after operation, during pregnancy or maternity, in infancy, childhood and old age. See page xxviii

#### KALAK WATER

Many diseases are complicated by "acidosis." An important part in their treatment consists in replacing those elements needed to maintain the alkali reserve.

In clinical practice a rational and agreeable method of alkalinization is afforded in Kalak Water.—See page

## Prompt Relief - -

When chronic constipation or intestinal toxemia is a causative factor, Pulvoids Tauro. phen will be found effective in conjunction with Pulvoids Natrico.

## Hypertension

Pulvoids Natrico are valuable in reducing blood pressure, pending the determination and treatment of the cause. Because of their enteric coating they do not disturb digestion or renal functioning, so that their use may be continued to maintain the blood pressure within safe limits.

## Pregnancy: Prenatal Care

As a prophylactic from date of declaration to term, the use of Kalak Water affords the patient a dependable defense against abnormal conditions that may be manifested as a result of mineral depletion.

Presenting a fully saturated solution of calcium as the bicarbonate, Kalak Water helps to supply the need of the patient for this essential base.

Kalak Water Company
6 Church Street New York City

## **PNEUMONIA**

and its treatment with

#### Antipueumococcic Serum Lederle

Refined and concentrated as prepared by FELTON

#### **ADVANTAGES**

#### Smaller Bulk-

Average volume is about one tenth that of the original serum.

#### Minimized Scrum Reactions-

Serum reactions are minimized due to the elimination of inert foreign proteins.

#### Standardization in Units-

This makes it possible to use the product with more certainty of adequate dosage

#### Procedure

10,000 to 20,000 units should be injected at the earliest possible moment after diagnosis.

Repeat every 8 hours until the temperature falls and beneficial effects are evident. If the disease is severe and the patient very toxic, double the unit dosage at 4 hour inter-

Antipneumococcie Serum (Lederle) is supplied in syringes containing 10,000 and 20,000 units each of Type I and Type II.

A Treatise on Pneumonia will be sent upon request

# Vita\* Glass Effective in Winter

St Mary's Hospital, Grand Rapids, is equipped with Vita glass

FEBRUARY sunlight coming through Vita glass windows in New York contains sufficient ultraviolet rays in the vital range to make it effectively antirachitic. This fact has been proved definitely by the experiments which Walter H. Eddy, Professor of Physiological Chemistry, Teachers College, Columbia University, has conducted for the past two years in that severest of winter months.

"In 1929," writes Dr. Eddy, "using a glass two years oldt, we not only obtained protection between February 16th and March 16th, but we also proved that three to four hours exposure was equivalent to a full 24-hour exposure in protective value."

#### Vita glass Transmission Constant After Few Weeks Exposure

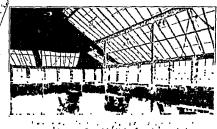

†The results of Dr. Eddy's experiment with Vita glass two years old add new weight to the conclusions drawn from other biological tests, in which seasoned Vita glass similarly proved its retention of anti-rachitic and normal growth-promoting properties.

Accelerated -----Standard Institute

and gro communed the power of seasoned Vita glass to transmit an effective amount of vital ultra-violet rays. These territories

(weati place v becor ıse.

Tests show that sunlight coming through Vita glass windows in any season has high health value

This is the Vita glass-equipped South Boston Health Unit

Dr. Eddy concludes: "I am convinced by these experiments that the installation of Vita glass windows in New York City insures the utilization of rays of real health value even in winter . . ."

The Eddy experiments confirm anew the results gotten with winter sunlight and Vita glass by the council on Physical Therapy of the American Medical Association, and also the results reported in numerous other tests by scientific bodies and individuals. In full agreement with them are the reports received from hospitals and sanitoria equipped with Vita glass throughout the United States.

More than 250 institutions for the treatment of disease are wholly or partially equipped with Vita glass. And from those in the latter class an impressive number of orders for repeat installations is being received.

Available to you upon request is the authentic report of actual clinical results obtained with Vita glass, especially in the hospitalization of children, by Drs. Caldwell and

Dennett at Post Graduate Hospital, New York. This report formed an article published in the il of the American Medical Association for

22, 1929. We shall be glad to send it to n receipt of the coupon below.

# Concentrated Anti-pneumococcic Serum Squibb Type I and Type II

Prepared according to the method described by Dr. Lloyd D. Felton of the Harvard School of Medicine.

This new concentrated ANTI-PNEUMOCOCCIC SERUM SQUIBB offers the following advantages:

- 1. Its small volume permits the administration of more than 10 times the quantity of protective antibodies supplied in an equal volume of unconcentrated serum.
- 2. Inert and objectionable proteins and lipoids have been removed.
- 3. There has been a marked reduction of chill-and serum-reaction producing substances.
- 4. Its use extends the benefits of biological treatment, since more than 60 per cent. of pneumonia cases are caused by Types I and II; whereas formerly an effective serum could be used only in cases of Type I.

Concentrated ANTI-PNEUMOCOCCIC SERUM, Types I and II, SQUIBB is supplied in syringes, each containing one dose. 10,000 units each of Type I and Type II pneumococcic antibodies, as measured by the Felton method, are contained in each syringe.

Write for full information, or consult the Squibb Professional Service Representative on his next visit.

Restful sleep ... induced by calming not forced by benumbing

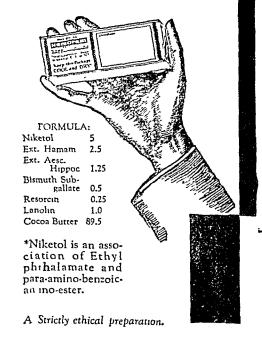

# **BROMURAL**

Bromural {alphabromisocalerylurea} is a quickly acting somnifacient, inducing a refreshing sleep. It is an efficient sedative in general nervous conditions. It fills a gap between the bromides and the powerful hypnotics, and is useful as a stronger sedative than the bromides or where a mild, yet effective hypnotic is in place.

Indications: Bromural is indicated in functional nervous disease, restlessness, in dysmenorrhea and nervous disorder at the menopause, palpitation of the heart, and nervous indigestion. Also as a sedative preparatory to operations, and in post-operative excitement.

As sedative 5 grains several times a day
As hypnotic 10 to 15 grains at bedtime
In 5 grain tablets and as a powder

### FACTORS THAT INFLUENCE PROGNOSIS AND END RESULTS IN UTERINE CANCER

BY WILLIAM P. HEALY, M.D., F.A.C.S., NEW YORK, N. Y.

TT seems quite proper that some part of the time available for scientific discussion at this meeting should be devoted to a consideration of the problem of uterine cancer, more especially since cancer of the female genital organs and particularly the uterus is extremely common. Much money, time and effort have been expended in impressing this fact upon the public. In a general way I have no doubt many individuals have been greatly bene fitted, either by the recognition and cure of so called precancerous lesions or the more prompt recognition of cancer itself and the institution of treatment for it. On the other hand we all realize that many patients refuse to heed warning symptoms and postpone altogether too long seeking professional advice. Also we must frankly admit that too many patients who seek advice for definite symptoms meet very little cooperation at times from the physician consulted, so far as clearing up the question of exact diagnosis is concerned.

There seems to be a great tendency on the part of many physicians to minimize, to delay and to procrastinate instead of grasping the problem, facing it squarely and wrestling with it in each individual case until a definite diagnosis has been established.

The cervix is the most common site for the disease in the female genital tract, possibly nine out of ten cases of uterine cancer are located in the cervix. This fact alone is a great asset in making a diagnosis as the cervix can in the vast majority of instances be both seen and felt.

After all a correct diagnosis is possible in fully 80% to 85% of all cases of cancer of the cervix, by any physician, on the clinical his-

and the pelvic examination as in only of all cases seen is the lesion so early a reasonable doubt would exist as to its identity. A doubt which would demand consultation or a biopsy or both together in order to determine the exact diagnosis.

It is well known that cancer of the cervix occurs more commonly in women who have born children and more especially it is believed where the cervix has been damaged by laceration and chronic infection and these secondary conditions have not been cleared up by proper treatment.

The greater number of cases of cervical cancer occur during the active menstrual life or at the time of the menopause. This fact confuses the patient as the only important symptom is abnormal uterine bleeding and this is regarded by the patient as the result of some ordinary incident in the routine of her life, its significance is overlooked and investigation is postponed while the disease progresses, hence only 15% of cases are seen at an early stage.

Cancer of the uterine body on the other hand is much more frequent after the menopause, in fact in our experience is rare before that event. Again the only important symptom is uterine bleeding. It would seem that any recurrence of bleeding after the menopause would be regarded as abnormal by the patient and would cause sufficient alarm to demand prompt medical advice. Our records indicate however that on the average twelve months elapse after the appearance of symmoms before these patients apply for treatment. A truly extraordinary situation difficult to explain.

I would also like to emphasize here that about 94% of the patients with cervical cancer have born children where as 25% of cases of corpus cancer are nulliparous,

I feel that it is extremely important to keep all cases of supposed or even undoubted fibromyoma of the uterus under periodic examination after the menopause. If there should be the slightest evidence of growth activity the entire uterus, including the cervix should be removed at once because the incidence of

of the Medical Society of the New Y., June 5, 1929.

7

carcinoma of the uterine body as a complication of fibroids after the menopause is too frequent to be ignored. It is indeed a great responsibility which a physician assumes when he assures a patient that an abdominal or pelvic tumor may be ignored.

The important factors that influence prognosis and end results in uterine cancer we believe are (1) Early Diagnosis. (2) Histologic Characteristics of the Tumor. (3) Choice of Treatment. (4) General constitutional condition of patient such as age, hered-

ity, susceptibility, anemia, etc.

The Early Recognition of the disease before it has spread from its original site and metastases have occurred is beyond doubt the most important factor in offering a favorable prognosis regardless of whether the lesion is treated surgically or by radiation therapy or by a combination of both methods.

It is self evident that a pemanent cure cannot be expected when definite metastases at a distance from primary focus can be identified.

At the Memorial Hospital under radiation therapy with a combination of radium and x-ray the early cases of carcinoma of the cervix in which the disease is localized give 60% of five year cures, whereas only 23% of the advanced cases remain well for five years. This difference indicates at once the tremendous importance of early diagnosis as a factor in prognosis.

The same situation is met with in cancer of the corpus, the early or favorable cases give about 60% five year cures by surgery or

by radiation therapy.

The Histologic Structure of the tumor as an important prognostic factor has been emphasized by various writers in recent years.

Broders of the Mayo Clinic deserves the greatest credit, at least in this country, for having placed the classification of cell types in carcinoma upon a definite basis. He identified four different cell types or grades beginning with Grade 1 which represented the adult highly differentiated type of epidermoid cancer cell and terminating in Grade IV in which the tumor is very cellular and is made up of completely undifferentiated embryonal or anaplastic cells. Grades 11 and 111 are intermediate between one and four in degree of cellular differentiation and evidences of anaplasia.

The interesting observation has been made and verified that the degree of clinical malignancy of these tumors varies with the cell type, the most highly developed cell which makes up the Grade 1 tumors is the least malignant, whereas the least differentiated cell type which composes the Grade IV tumors is the most malignant and rapidly invades the lymphatics.

A still more remarkable and to the patient, most important observation has been made that the degree of radio sensitivity of the epidermoid cancers of the cervix varies directly with the cell type, Grade 1 being the most radio resistant and Grade IV the most radio sensitive.

The extreme importance of this observation is evidenced by the statistics of end results in cancer of the cervix under surgical or radiation treatment respectively especially in Grade IV the most malignant cell type. Under surgical treatment by hysterectomy 9½% of the cases in this group remain well for five years, whereas under radiation therapy 66% remain well for five years. Thus emphasizing the fact that the extreme malignancy of this type of tumor cell is more than

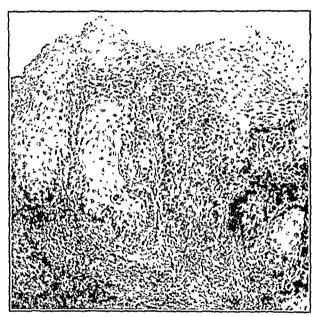

Figure 1.

Photomicrograph showing epidermoid carcinoma of the Cervix.—Grade I.

counterbalanced by its marked radio sensitivity.

In like manner the cancers of the corpus, known as glandular cancer or adenocarcinomata can be readily subdivided into four groups based upon variations in cell type and structure.

In a recent study of our cases of corpus carcinoma at the Memorial Hospital it was found that the Grade 1 cases were the least malignant and the most readily cured by any form of efficient therapy. Whereas the Grade IV cases were the most malignant and at the same time the most radio sensitive and histologically closely resembled the anaplastic group IV variety of cervix cancer.

Under surgical treatment by hysterectomy

the Grade IV cases of corpus cancer give uniformly bad results, not one of Mahle's cases, in his report from the Mayo Clinic had survived five years. Under radiation therapy on the other hand 50% of our cases of Grade IV corpus cancer were living and well at the end of five years. This indicates the great necessity for a preliminary biopsy or curetage with careful microscopic study of tissue by a competent tissue pathologist before finally subjecting the patient to operation.

Choice of treatment as a factor in prognosis in uterine cancer is much more important than seems to be generally recognized by the profession at large. There still is too great a tendency on the part of the individual surgeon to treat all cases of uterine cancer alike, that is by hysterectomy and with little or no regard for the histologic characteristics of the tumor or its classification according to Broder's plan.

Under such treatment practically all patients with tumors of the Grade IV type are condemmed, regardless of how favorable for operation the case seems to be.

Figure 2
Photomicrograph showing plexiform epidermoid carcinoma of the Cervix—Grade II.

It is absolutely essential that a preliminary study of the histologic structure of the tumor be made either from a biopsy specimen or material obtained by curetage in order to determine the kind of therapy that should be employed. All authorities today are agreed that the Grade IV group of tumor cases should be treated by radiation therapy and not by hysterectomy.

Moreover advanced cases which form 80%

to 85% of all the cases of cervical cancer are entirely out of the surgical group and must be treated by radiation therapy if anything at all is to be tried.

It is worth remembering that under radiation therapy 23% of all our advanced cases were still alive at the end of five years, a really remarkable salvage since the outlook was hopeless as far as operation was concerned when the patient was first seen

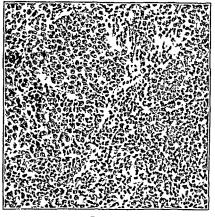

Figure 3

Photomicrograph showing anaplastic epidermoid careinoma of Certix—Grade III

#### CONCLUSIONS

- Early clinical diagnosis of uterine cancer, cervix or corpus, is the most important factor in prognosis.
- 2. Grouping of tumor according to cell type based on Broder's classification is important as a guide to correct treatment and therefore a protection to the patient especially if the treatment contemplated is surgical.
- 3. The prognosis and end results in uterine cancer vary according to whether operation or radiation therapy is the method employed. With operation all group IV cases give uniformly bad results, whereas with efficient radiation therapy the results are surprisingly good. 66% of the favorable cervix cases and 50% of the favorable corpus cases remained well five or more years
- Operation, the Wertheim hysterectomy, is associated with a primary mortality of 15% in expert hands whereas radiation therapy should be practically free from mortality.
- 5. In our series no cases of cervical cancer under 30 years of age survived five years

### INTERPRETATION OF BLOOD PRESSURE READINGS\*

BY ALLEN A. JONES, M.D., F.A.C.P., BUFFALO, N. Y.

the clinician when he takes the blood pressure but much may be learned if the instrument fails to register a high pressure. For the sake of brevity we seek to ascertain one or more of several things in relation to the circulation when we feel the pulse, listen to the heart or use the sphygmomanometer. We wish to learn whether or not we are dealing with:

- 1. Normal blood pressure,
- 2. High blood pressure,
- 3. Low blood pressure,
- 4. A fluctuating tension,
- 5. High pulse amplitude,
- 6. Low pulse amplitude,
- 7. Normal pulse lift,
- 8. Regular or irregular size and force of the pulse,
- 9. Regularity of pulse registration at the bend of the elbow,
- 10. Soft, thickened or calcareous arteries,
- 11. Pulse frequency.

It is not necessary to discuss normal blood pressures here excepting to note that 110 systolic seems normal to some persons while, for others, 130 to 140 is apparently normal; that is, these pressures are repeatedly found without any evidence of disease anywhere in the body. It may be argued, however, that few people are really absolutely healthy and live without the slightest disturbance chemically, cellularly, organically or functionally.

Some degree of hypertension may be said to exist when the pressure readings register above 140 and are maintained at that reading or a bit higher on repeated examinations. The diastolic may be found at 80 or 90 and remains there at all readings. The ideal pressure has for years been placed at 120 systolic and 80 diastolic with a pulse amplitude of 40, or one-half the diastolic pressure. Pressures rise in two fashions: in one the systolic pressures rise and the diastolic remain at 80 or 90. In others, the systolic and diastolic rise simultaneously.

One may have taken a pressure in 1923 and found it 140/80 and in 1925—160/80, while in 1927 it registered 180/90 and in 1928, 200-220/90-100. On the other hand systolic and diastolic rise together and from the figures 140/80 in 1923, the pressures rise so that 1928 discloses a registration of 230/140. In the latter

case the diastolic pressures rise steadily, though the pulse pressures, while still abnormally high, are lower than in the first instance. It is difficult to estimate the significance of this and intensive study is often required to answer the questions which naturally arise.

Are we dealing with so-called essential hypertension or with vascular or with renal disease? Here the interpretation of our blood pressure readings will depend upon the state of the heart, the aorta, the arteries and arterioles and the kidneys. If the heart is manifestly enlarged and there is a relative mitral insufficiency with a few basal pulmonary rales and yet a fairly good urine, quantitatively and qualitatively, with normal urea concentration tests and normal blood nitrogen, are we to assume that the renal phase is subsidiary in the clinical syndrome? May we postulate that with a mere prominence of the aorta and a negative Wassermann we are facing an arterio-capillary fibrosis and arteriolar hypertensive nephrosclerosis? In many cases this is the truth but may not some cases illustrate the influence of toxic or infectious arteritis. Adequate or serious focal infections are found to be the underlying cause in some instances. Although some teeth may have been lately extracted and though dentograms may, within the past year or two, have absolved the teeth from blame, yet, re-examination may reveal pyorrhœa, peridental and subdental pathology. Or, tonsils previously considered harmless, may be found culpable. Or sinuses may be at fault or cholecystitis, appendicitis, pyelitis, cystitis or prostatitis, colitis or diverticulitis may be partly to blame. In a woman, endometritis, salpingitis or other pelvic disease may be etiologic factors.

High blood pressure in women often raises considerations different from those in men. The menopause, for instance, is a factor which is frequently associated with a high blood pressure. In the writer's experience, the systolic pressures have been found high with the diastolic but slightly elevated in a large proportion of menopause high pressure cases. There may or may not be other symptoms of the menopause such as hot flashes. Probably this nervous type of elevated tension depends upon endocrine imbalance and the cessation of monthly loss of blood. It may be aggravated by emotional upsets, worries, family or household anxieties. The menopause occurs at the time of life when the hopeful buoyancy of youth is ebbing, when many women's children are marrying, perhaps not too happily, and when a woman may suffer from real or

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 4, 1929.

fancied domestic infelicity which may contribute to disturb her.

A gouty diathesis may play a part in the hyperpiesis of women between forty and fifty years of age and, although perhaps not so common as in men, more or less arteriosclerosis may be present. In these cases the diastolic pressure is usually elevated as well as the systolic. One of the most difficult questions to decide in everyday medicine is that which relates to so-called "essential hypertension." Is there such a thing? What is it? What is its explanation? What is its prognosis? Many doubt its existence. We undoubtedly encounter people with high blood pressure in whom we are unable to find a reasonable or adequate cause. If, however, some of these individuals are observed long enough, or come to autopsy, an explanation is forthcoming. spite of clinical renal efficiency, arteriolar fibrosis may be found in sections of the kidney and other organs. It is well to ascertain whether or not hypertension is constant or paroxysmal An obscure toxic thyroid, or what Warthin calls the "Graves constitution," is sometimes the cause of hypertension either of temporary or permanent type. An adrenal tumor may be the cause of paroxysmal hypertension as reported by Pincoffs. Prolonged nervous tension with repeated subjections to acute mental trauma and agony may elevate the pressure very definitely and in the interpretation of a reading this should be remembered. Heredity is a factor is some cases; father and children may present almost identical pressure readings as well as sphygmographic tracings.

In order that a person may be said to have "essential hypertension" the pressure should be found elevated at all times for years without any cardiac enlargement or evidence of the slightest disorder of renal function in any respect, nor of any eyeground changes; nor any abnormality of graphic cardiac tracings; nor any impairment of general nutrition, nor of any clinical or laboratory evidences of arteriosclerosis; nor any thyroid tumor or manifestations of hyperthyroidism. In other words the person should be quite free from disease under the most searching and critical clinical examination. Occasionally such a person is found and years of observation reveal nothing excepting high blood pressure readings. These are the exception. One might suspect capillary contraction from stimulation of Rouget's cells as Krogh has cited, but no definite, even temporary organic limitation of the capillary field is observed. Sometimes long continued hypertension eventually or inevitably results in arteriolar and arterial fibrosis.

Let us here consider the so-called "malignant hypertension." In our experience this is a term applied to high blood pressure, both systolic and diastolic, which fails to respond to any or all therapeutic measures. Neither rest, diet, eliminative procedures, abolition of focal or other infections, theobromine preparations, mercury, iodides, sodium citrate, nitrites, high frequency current, warm baths, climatic treatment nor any other method of treatment has any lasting beneficial Systolic pressures of 250 to 300 and diastolic of 140 to 160 or even higher may be encountered. The peripheral arteries are prominent, hard and sometimes tortuous, the radials and brachials are pronouncedly hard and unyielding, the heart hypertrophied and working forcefully, the aortic second sound hammering, the urine of low specific gravity, whether copious or scanty, the patient sleepless and nervous with anorexia, bad breath, coated tongue and perhaps headache. These symptoms may be present for some time before either retinal hemorrhage, cerebral hemorrhage or high blood nitrogen are manifest. The clinical picture is outstanding and unmistakable and corresponds to Gull and Sutton's generalized arterio-capillary fibrosis. impaired renal function is but a part, though a very serious part, of the disease. The hypertension is malignant in the sense that it is one manifestation of a fatal cardiovascular renal dis-

When a high bood pressure is found one naturally examines the thyroid. While thyrotoxicosis excites hypertension it usually fluctuates. There are, however, some instances in which it is persistent and the readings are recorded in high figures.

The interpretation of high systolic and very low diastolic readings is usually aortic regugitation but there are found a few instances of low diastolic pressures, even down to zero, with no evidence of aortic leak. These are thought to be due to vaso-motor paralysis or a complete absence of vascular tone.

In a few cases polycythemia proves the explanation for high blood pressure; especially is this found in those exhibiting marked hyperemic flushing with some cyanosis, vertigo and headache; those in whom there is augmented blood volume as well as hyperglobulia.

It is well to remember that a sudden decline of a high blood pressure occurs in cases of cardiac infarct. In some instances of coronary thrombosis the systolic pressure falls whereas the diastolic may remain stationary and thus the pulse amplitude may be lessened very decidedly. In one case we observed a pulse lift of ninety narrow in a few days to twenty following cardiac infarction.

How informative blood pressure readings may prove in valvular heart disease sometimes engages a clinician's thought. In aortic regurgitation a pressure reading may in itself prove well nigh diagnostic with the sharp, short systolic sounds and the fading sounds as the abnormally low diastolic reading is approached. In aortic

stenosis the fainter, less obtrusive systolic knocks which are a bit blurred and indecisive with the diastolic which indicates a low pulse amplitude may be suggestive. In a compensated mitral disease the pressure readings may give no diagnostic hint but with auricular fibrillation which so often occurs with mitral stenosis the continuous irregularity and the varying strength and tones of the sounds are almost diagnostic and the maximum pressure reading is found quite above the point where most sounds are recorded. The figures for the diastolic also vary several points and the definite pressures both systolic and diastolic are difficult to determine.

In cases of replacement fibrosis of the myocardium with a badly weakened heart the systolic sound may be weak all through and the reading limits indecisive. This also obtains in some young persons with flabby hearts and arteries in whom the auscultatory arterial sounds are so faint that it is with great difficulty definite pressure readings are procurable. In some instances the auscultatory method reveals a silence up and down the scale and the systolic pressure is necessarily determined by palpation of the radial while the diastolic remains unknown. In some of these cases the heart sounds may be quite good and the failure to obtain auscultatory pressure readings may depend upon low vascular tonus. It may not be amiss to remind ourselves not to allow a so-called "silent-gap" to mislead us in reading a systolic pressure.

This naturally introduces the question of low blood pressure which assumes an importance which gives it a special place in medical literature.

In the young both the systolic and diastolic pressures are frequently low. It is not uncommon to find the systolic 90 or 100 and the diastolic 60 or 70. In a large series of vigorous young people the values are usually nearer 120 systolic and 75 to 80 diastolic. Some pressures are raised by vigorous exercise for awhile or are quickly responsive to nervous excitement or tension while others are not so responsive.

Continuous low blood pressure is found in some with the hyposthenic habitus and is considered a sign of constitutional inferiority, the subjects being unable to bear the wear and tear of life as well as those with normal pressures. This is true in a large number of instances yet many persons are found with low blood pressures who are able to carry on as well as other healthy people and indeed who enjoy long and active lives. It is hard to interpret the significance of low pressures in many who present themselves as patients complaining of a great variety of complaints. The low blood pressure is found in a routine thorough examination. The heart sounds may be good, its rate and size normal and these belie the low pressures discovered. There is often a so-called "drop-heart," visceroptosis and the individual is of the slender type and is underweight. There is no breathlessness nor are there any signs of circulatory impairment. In these cases search must be made to discover whether or not there is a hidden tuberculosis, an anemia, morbus Addisonii, gastric or duodenal ulcer, diarrhœa or some disease with which hypopiesis is often associated.

The strains and stresses of life may bear hard on these individuals of low pressure type, fatigue follows early on both physical and mental endeavor, blood pressure declines rather than rises and the heart and arteries display a lack of tone and staying power which is manifested by increased cardiac rate and lowered pulse tension. Pallor is apt to appear in place of the flush of vigor upon exercise and muscular tremor with a distressing sense of nervous exhaustion or instability soon supervene in the event of athletic contest or nervous strain.

In the mill of life, then, those who suffer from hypopiesis are victims of a real handicap.

This cardiovascular hypotonia is sometimes a result of diphtheria, typhoid fever, streptococcic or influenzal infection earlier in life. It may be found associated with valvular disease following rheumatic fever, chorea, scarlet fever or other infection. It is important to look carefully into the history of cases illustrating a continuous hypopiesis. A flabby myocardium and arteries of lowered or unstable tone may be found to have resulted from so-called heart-strain or they may be part of the clinical syndrome which is popularly termed neurocirculatory asthenia. Some years ago there came to us from the lumbering camps of northern Pennsylvania a goodly number of apparently strong men who complained of backache and a quite used up feeling who presented no definite evidences of physical defect excepting slightly dusky face and hands, notably small weak pulses, weak heart sounds and an abnormally low blood pressure. These otherwise vigorous looking men gradually improved under rest, large doses of nux vomica, small doses of digitalis and regulation of their living conditions. As a valuable supplement in the examination of low blood pressure cases the low voltage of the electrocardiogram is interesting. Electrocardiograms, however, frequently fail to show evidence of degenerative changes in the myocardium but sometimes they are quite definitely illustrated in cases of rheumatic myocarditis. We have seen more tracings showing slurring of the Q-R-S-complex in high pressure than in low pressure cases. Earlier in this paper mention has been made of those cases of high pressure subsequently developing low pressure and in taking our readings we often suspect that higher pressures have existed prior to our low pressure find-Reference is here made particularly to those exhibiting habitually low pressures who

are not suspected of having had hypertension, coronary disease or myocardial fibrosis. It is well to bear in mind, however, that some of the worst cases of coronary atheroma as seen postmortem, even cases with angina pectoris or badly damaged kidneys, were found with low blood pressures ante-mortem. Friable atheromatous arteries of the heart or brain may co-exist with low blood pressures.

In the interpretation of blood pressure readings it is best to correlate the findings with all other available clinical criteria and thus will the interpretation yield more workable guidance.

The literature of the subject is too enormous to be taken up in this short discussion but those who are especially interested in this wellworn subject and desire broad information concerning it, will find both hyperpiesis and hypopiesis

thoroughly considered in J. F. Halls Dally's books on these subjects.

One naturally thinks of hypoadrenalism in cases showing habitual low blood pressure without some special weakening disease or constitutional abnormality to account for it but it is difficult to establish its existence. Some hope, however, of raising such blood pressures to a normal level is held out by the preparation of an extract of the suprarenal cortex which promises good results.

Another point in blood pressure readings refers to the different figures which may be yielded by the two arms and thus a suggestion of aneurism of the aortic arch may be offered.

And finally alarmingly low pressure readings may herald hemorrhage, shock or approaching death,

#### THE RELATION OF COLDS TO PNEUMONIA\*

BY JAMES W. W. DIMON, M.D., UTICA, N. Y.

HEN I was asked by our chairman to talk to you this afternoon on the relationship of pneumonia to the common cold, it became my first problem to clarify my own conceptions on the subject. It is evident that one must have a clear understanding of the etiology and development of these two diseases before he can consider their con-nections. Our knowledge of pneumonia in these respects is quite accurate and fairly extensive. In regard to cold however, I could find very little that was helpful, and indeed, most of our standard works entirely ignore this subject, or at best pass it over with a scant paragraph or two. Among the few articles available there seems to be a diversity of opinion. Some accept colds as a true contagious disease; others assume the cause as a chilling and ischaemia of the local mucous membranes, which allow the already present bacterial flora of the nose to start an infection of mild nature; others stress such factors as nasal pathology and lowered resistance through improper clothing, etc., without going too deeply into the actual etiology. One very interesting theory assumes the catarrhal symptoms as due to an anaphylactic reaction against foreign protein, presumably bacterial. However, the impression one gets in looking over the recent literature is that there is no unanimity and indeed very little interest.

I should presume that fully 40 per cent of the practice of the general medical physician consists in the treatment of this so-called minor malady. Nevertheless, he is thrown almost entirely on his own resources, with very little aid from his professional brothers,

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

clinical or laboratory. The result of this situation is that the general medical man has no accurate knowledge either of the bacteriology or the treatment of this widespread affection except such as he may gain through his own personal clinical observations. We are forced to rely for our therapeutic measures on the latest product of our manufacturing drug companies, and it is no wonder that our patients often drift off to the chiropractor who happens to be in vogue at the time, and with whom, on account of our mutual ignorance, we come into active competition.

Although there is an apparent lack of accurate knowledge about the nature of colds, one cannot pursue an active medical practice without forming his own theories, based upon his personal observations, and I hope it may not be deemed amiss if I talk for a few

moments along this line.

My own very distinct impression is that there are two kinds of colds. One follows exposure, or may in fact be brought on by anything that temporarily lowers the resistance of the nasal and pharyngeal mucous membranes, and is probably caused by the normal bacterial flora of these parts. These colds are usually quite amenable to treatment, rarely lasting over a day or two. Individual resistance seems to vary a good deal, and their frequency is of course greatly increased by the presence of nasal pathology, such as adenoids, hypertrophical turbinates, chronic sinus conditions, etc. The second type is without doubt a truly contagious disease. history of successive cases in a family or a community, and the frequent epidemics that occur during our winter season, leave, little room to doubt this fact.

There is a group of contagious respiratory infections which must be distinguished from the common head colds. I am referring to influenza or grippe. That this disease has a distinct entity has long been recognized, and it has won itself a place in most of our standard text books. Few of us in active practice failed to recognize this fact, either in the fearful epidemic of 1918-19, in the comparatively mild one of January, 1929, or in the occasional sporadic cases. The sudden onset as against the slight but definite prodromal period when one knows that he is coming down with a cold, the fever as against the subnormal temperature of the uncomplicated head cold, the slightness or absence of catarrhal discharge in influenza, and the long drawn out prostration and weakness as against the rapid recovery from colds, are some of the features that distinguish these diseases.

I do not think that the bacteriology of influenza or grippe has been successfully demonstrated, nor has the causative agent of the common head cold been discovered. Indeed it would seem that these are caused not by one specific organism, but rather by a group of similar or related organisms. The different epidemics that occur during a winter have distinguishing characteristics: in one we will note a tendency to ear and sinus complications, another may be characterized by digestive symptoms, etc. Also the immunity conferred by an attack of cold would seem to hear out this same supposition. When an individual contracts and recovers from a cold he will not immediately recatch this particular cold from his family or friends, but when, a few weeks later, a fresh epidemic with slightly different characteristics occurs, he is again susceptible to this new infection. Of the specific nature of the infecting organisms we know practically nothing. It may well be that it is not hacterial at all. To be sure, the more common pathological germs can be cultured from the throats of these patients, but this can be done also from people who are in apparent health. It is quite possible that these colds may be caused by some ultramicroscopic organism not yet discovered. Perhaps this organism does not even produce its effects in the way we ordinarily characterize as infection, but rather through a protein anaphylactic reaction or some such mechanism. There are two things which to my mind seem to give weight to such a view: namely, the production of catarrhal irritation with mucus rather than true pus; and secondly, the subnormal temperature ranging from 95° to 98° rather than fever. I will have to qualify this statement as follows. When one of the common complications of colds develops, such as otitis, tonsillitis or sinusitis, we immediately have a fever. But let us note these further

facts, that while a culture from the nose or throat of an uncomplicated cold is inconclusive, 'the culture from an otitis or sinusitis usually shows a pure growth of pyogenic bacteria, and while the discharge from an uncomplicated cold is mucus, the discharge from a complicating ear sinus, etc., is pus or mucopus. This would look as if these complicating infections might be caused by bacteria as secondary invaders.

In dealing with pneumonia we have two subdivisions to consider. The first is lobar pneumonia, a clear cut disease running a definite course with characteristic symptoms. It is caused by the pneumococcus in one of its types. The second is bronchopneumonia, a much more variable condition, usually, if not invariably, secondary to some preceding infection, and caused by a variety of organisms, streptococci, pneumococci, the influenza bacillus, etc. In considering the relationship of pneumonia to the common cold, let us treat

these two varieties separately.

We will first take up bronchopneumonia. We have on the one hand a group of diseases classed under the general heading of colds, of doubtful etiology, but probably caused by a number of allied or similar organisms, very possibly not bacterial in character. On the other hand we have the bronchopneumonias, definitely proven as bacterial in character, and caused by any one of a number of common pyogenic germs. These bronchopneumonias are usually secondary invaders. They may follow any of the acute diseases, measles, whooping cough, etc. Is there any reason to suppose that their relationship is different in the case of colds? The pneumonia germs are ready at hand. A very large percentage of apparently healthy individuals will show a growth of some of the common pyogenic bacteria in their throats. It seems to me a natural supposition that the cold simply prepares the soil and lowers the resistance so that the pneumonia can get a foothoid. It is not an uncommon thing for apparently benign bacteria to assume such a pathogenic role when opportunity offers. The innocuous skin staphylococcus may suddenly begin to produce boils and the colon bacillus is often found as the cause of a pyelitis. Furthermore, whatever the preceding disease, measles, typhoid, or cold, the bacteriology of the pneumonia is the same, one of the common pyogenic organisms, and if we assume that these organisms are also the cause of the cold, we must assume that they are the cause as well of the measles or the typhoid, which is absurd. I think we may safely say that bronchopneumonia germs have a widespread distribution, and that they are often in our throats or nearby, waiting only a favorable opportunity to show their pathogenic properties.

Lobat pneumoma is usually, though not necessarily, a primary disease. There are two things necessary for its occurrence First, the presence of the pneumococcus, second, a receptive soil in the lungs of the patient I do not know whether the usual source of the pneumococcus has ever been shown. It seems to me that there are only two probable theo It may come from the sputum of the pneumonia patients This is a possible, but probably not a very usual occurrence, Lobar pneumonia is not often acquired by direct contact, and the viability of the germs outside of the body is not very great. On the other hand, the lobar pneumonia germs may have a fairly wide distribution, just as in the case of bronchopneumonia I do not know whether any work has been done in typing out the benign pneumococci found in the throats of well individuals It would be interesting to know whether they fall into the same general classes as do the pathogenic germs, and if so, what is the relative proportion of the different types in these two conditions. We cannot tell absolutely what makes the living tissue receptive to these germs, but in general it seems to be a lowering of vitality however brought about,—by exposure to severe weather conditions, by alcoholic poisoning, prolonged over exertion or worry, the weakness of infancy or old age, or, finally, by the debilitation of disease In this last, colds will find their place, and there is no doubt that colds, if sufficiently severe and debilitating, can be followed by lobar as well as bronchopneumonia

In concluding let me leave this thought The sequence of cold and pneumonia is too frequent to allow us to doubt that there is a relationship, and whatever the mechanism, I think we must accept this relationship as one of cause and effect Let us make this fact plain to the public whenever we have the

opportunity Let us teach our patients that colds must be taken care of, that they are not simply a disagreeable experience which has to be gotten through with as best one can, but that they hold a threat of real danger to our health and lives Let us also stress the fact that most colds are contagious. Now lit tle importance is placed on this fact in every day life We go about our business breathing our cold germs into the faces of our friends and carrying in our pockets handkerchiefs covered with dry nasal secretions it is, of course, impossible to isolate every one having a cold, people should at least be taught to keep their distance, to turn their heads aside when they speak, and to cover their mouths when they cough

The situation with young children is even There is no doubt that they more serious suffer more from colds and their complications than do adults, and their lack of experience leads them to neglect protecting themselves against unnecessary exposure. Nevertheless our children are sent to school sniffling and coughing and spreading their germs among their companions when they should be at home under the nursing care of their paients so that they may avoid the all too frequent and severe complications I am in favor of a much more rigid exclusion from school especially in the lower grades, and I am in favor of treating colds in young children by rest in bed at least for the first few days

Let me finally say that a campaign of education is needed in this subject, and that as a basis of education we must have more knowledge of the etiology of colds and their relation to pneumonia. Such knowledge will come when we have a more general interest among both the practising physicians and the research workers in making and recording observations and experiments.

#### MINOR POINTS IN MAJOR SURGERY\* BY GEORGE W COTTIS, M D. F A C S JAMESTOWN N Y

Tall difference between a good surgeon and a spectacular operator is not appreciated at all by the latty and not enough by plus scrams. Lay writers, in prose and in verse, extol the deft fingers, the subtle touch, or the image desterity of the surgeon, but seldom mention his surgical judgment or his understanding of the complex chemical, physical and psychic processes with which he has to deal. The popular conception of a surgeon is a glorified combination of a juggler and prestidigitator, who with a different environ-

ment might have been a first class vaideville artist, or an expert pickpocket. This type of sur geon may perform a mechanically faultless gas troenterostomy, but that is small consolution to the patient of his symptoms are due to takes. It is only the undertaker who profits from a perfectly performed resection of the boxed on epittent who should have no mere than the simplest possible draining operation.

Such major errors in diagnosis and poor surgical judgment increase our mortality and discredit surgery. Minor errors increase morbidity prolong convolvacione and cause innecessity suffering. It is chiefly of these that I wish to speak

<sup>\*</sup>Tend at the Animal Meeting of the Milital occiety of the State of New York at Utica N Y June 1229

There is a group of contagious respiratory infections which must be distinguished from the common head colds. I am referring to influenza or grippe. That this disease has a distinct entity has long been recognized, and it has won itself a place in most of our standard text books. Few of us in active practice failed to recognize this fact, either in the fearful epidemic of 1918-19, in the comparatively mild one of January, 1929, or in the occasional sporadic cases. The sudden onset as against the slight but definite prodromal period when one knows that he is coming down with a cold, the fever as against the subnormal temperature of the uncomplicated head cold, the slightness or absence of catarrhal discharge in influenza, and the long drawn out prostration and weakness as against the rapid recovery from colds, are some of the features that distinguish these diseases.

I do not think that the bacteriology of influenza or grippe has been successfully demonstrated, nor has the causative agent of the common head cold been discovered. Indeed it would seem that these are caused not by one specific organism, but rather by a group of similar or related organisms. The different epidemics that occur during a winter have distinguishing characteristics: in one we will note a tendency to ear and sinus complications, another may be characterized by digestive symptoms, etc. Also the immunity conferred by an attack of cold would seem to bear out this same supposition. When an individual contracts and recovers from a cold he will not immediately recatch this particular cold from his family or friends, but when, a few weeks later, a fresh epidemic with slightly different characteristics occurs, he is again susceptible to this new infection. We have on the one hand a group of diseases classed under the general heading of colds, of doubtful etiology, but probably caused by a number of allied or similar organisms, very possibly not bacterial in character. On the other hand we have the bronchopneumonias, definitely proven as bacterial in character, and caused by any one of a number of common pyogenic germs. These bronchopneumonias are usually secondary invaders. follow any of the acute diseases, measles, whooping cough, etc. Is there any reason to suppose that their relationship is different in the case of colds? The pneumonia germs are ready at hand. A very large percentage of apparently healthy individuals will show a growth of some of the common pyogenic bacteria in their throats. It seems to me a natural supposition that the cold simply prepares the soil and lowers the resistance so that the pneumonia can get a foothoid. It is not an uncommon thing for apparently benign bacteria to assume such a pathogenic role when op-portunity offers. The innocuous skin staphylococcus may suddenly begin to produce boils and the colon bacillus is often found as the cause of a pyelitis. Furthermore, whatever the preceding disease, measles, typhoid, or cold, the bacteriology of the pneumonia is the same, one of the common pyogenic organisms, and if we assume that these organisms are also the cause of the cold, we must assume that they are the cause as well of the measles or the typhoid, which is absurd. I think we may safely say that bronchopneumonia germs have a widespread distribution, and that they are often in our throats or nearby, waiting only a

favorable opportunity to show their patho-

genic properties.

John Wyeth published his report of 200 appendectomies without burying the stump. From that time many surgeons, including ourselves, have never buried the stump unless necrosis extending to the very base, made simple ligature unsafe. There is no reason for traumatizing the cecum with a purse string suture. It has repeatedly been proven that the suture is always infected by passing into the mucosa and protective omental adhesions often result. On the other hand the appendix stump is dead as soon as it has been crushed and ligated. Adhesions to dead tissue do not occur. Examination of scores of stumps treated by both methods has shown a smooth cecal wall, with an almost invisible scar and no adhesions where the stump has been simply ligated, while the infolded stumps are shown by a nodule in the wall and in most cases by omental adhesions to the infected suture line. The fact that so many surgeons still go to the trouble of inflicting this unjustifiable trauma suggests that we should ask ourselves the reason for our procedure in other cases. For example.

#### Drainage

We all agree that a deep abscess of the thigh or palm should be drained. There is no such unanimity in regard to the peritoneal cavity. Why? Let us apply our rule of reason. In the cellular tissues of the thigh or palm there is no limiting or protective membrane and infection spreads by continuity, or in tendon sheaths, or through lymph vessels. Relief of pressure is essential and some form of drain gives better results than any other treatment. What are the accepted facts concerning the reactions of the peritoneum?

1. The endothelial lining is very resistant to infections. Even pus under pressure seldom passes through it to infect the outer layers of the ab-

dominal wall.

2. It has the property of forming adhesions to wall off any source of irritation, whether bacterial or mechanical.

3. It secretes large quantities of fluid rich in autibodies and full of phagocytes.

4. It readily absorbs fluids.

How do these functions affect the question of drainage?

In the case of acute appendicitis, we get an early exudate of clear or turbid fluid. This is now universally recognized as being purely protective, and there is no indication to remove it, to say nothing of draining it.

A gangrenous, stinking appendix without gross perforation is a different case because we know that bacteria have passed through its walls and the outer surface is infective. If the appendix is removed we know that we can safely close the peritoneum, but not the skin. The subcutaneous fat and the relatively bloodless aponeurosis have

little resistance and we have the same situation as in the abscess of the thigh. The stinking grey sloughing membranes which we used to get with closure of the skin around a drainage tube are now never seen. We simply pack the outer wound with B. I. P. gauze. Even with a foul appendiceal abscess, this packing can be left for five or six days, with perfect assurance that when it is removed we will find healthy red granulations permitting secondary closure by adhesive straps or suture.

Up to this point most surgeous are in agreement. But what about perforative appendicitis with frank pus formation? Either the pus is walled off or it is not, depending usually on whether or not the patient has been given a cathartic. If the appendix lies in an abscess cavity, and can be removed without breaking through the wall of adhesions, the pus can be aspirated and the peritoneum closed without drainage provided the cavity is lined with functioning endothelium. If the abscess has existed long enough for the endothelium to be destroyed or badly damaged, we are realing with an extraperitoneal abscess and a cigarette drain is indicated. When in doubt, we drain for 24 hours.

General peritonitis. Given a belly full of infective fluid, with no limiting adhesions, whether following perforative appendicitis or a perforated gastric ulcer, the mortality increases with the number of drains used. This was proven by the British Army surgeons in the third year of the World War. Multiple gunshot wounds of the intestines treated by suture of the perforations, and all sorts of drains, gave a frightful death rate. All methods of treatment failed to reduce the mortality until closure without drainage was tried. In spite of the fact that operation was always performed late, seldom under twelve hours and often after twenty-four hours, an amazing number of patients were saved. It is reasonable to believe that our results in civilian practice will be improved if we adopt the same procedure in all cases where we can remove the source of infection. Let us apply our rule of reason again.

What happens when we insert a drain? Within a very few hours it is surrounded by a mass of omentum and bowel. Experiment has shown that in six hours after the drain is inserted, if the peritoneal cavity be filled with a dye such as methylene blue by injection at some other point, little or none of the dye can be recovered thru the drain. When a patient recovers from general peritonitis he does so not because a few cubic inches are drained, but because the entire peritoneal cavity not reached by the drain has been able to take care of the infection, by its own power. If 99 per cent of peritoneum which we do not traumatize can do this, of what advantage is it to traumatize the 1 per cent by a foreign body? This may sound theoretical, but the correctness of the theory is easily proven by practice. Let me illustrate.

The last case of general peritonitis which we drained was a boy of ten who had appendicitis for two days before the family physician gave him a large dose of castor oil. The bowel movement and the perforation occurred almost simultaneously a few hours later. On admission six hours afterward, all the symptoms of general peritonitis were present. At operation the appendix was found gangrenous and perforated, with a large fecolith lying loose near the cecum. There were no adhesions and the entire abdomen was filled with thin turbid fluid. The appendix was removed and a drain inserted, to be loosened in 24 hours and removed in 48 hours. The wound healed nicely, but on the fifth day there was a rise in temperature with intermittent colicky pains. On the ninth day a mass could be palpated to the left of the midline. A midline incision was made. The general peritoneal cavity appeared normal and contained a moderate amount of clear peritoncal fluid. Dense adhesions surrounded the region which had been drained. A loop of bowel was firmly adherent to the anterior abdominal wall in the left lower quadrant. A finger was insinuated through these adhesions until a large cavity full of thick stinking pus was opened. It extended up along the outer side of the descending colon as far as the costal border, and was drained through a stab wound in the left flank.

The important points in this case are: 1. The region drained was walled off from the rest of the abdominal cavity. 2. A large secondary abscess developed in the left flank. 3. These two regions were separated by the greater part of the peritoneal cavity which had returned to a normal condition. It seems reasonable to conclude that our drainage had nothing to do either with the distant abscess or with the clearing up of the infection in the median portion of the abdomen, which was walled off both from the drainage area and from the abscess.

The next case to be admitted was a man of 40 in whom we found the belly full of thin foul smelling pus, a perforated appendix, a free fecolith and no adhesions—exactly the same condition as in the preceding case. We removed the appendix, closed the peritoneum and muscle without drainage and packed the superficial wound with B. I. P. gauze. The postoperative course was not different from that of an ordinary interval appendectomy. His temperature before operation was 102°. Twelve hours later it was normal and at no time did it go above 99°.

In cholecystectomies, the omission of a drain is more dangerous for two reasons. First, because massive leakage of bile gives a more violent peritonitis than pus does. Second, because the ligation of the cystic duct is often done necessarily at the bottom of a deep hole and the ligature slips either because it is insecurely knotted or because it is tied while the duct is held under tension. A third danger is the use of too heavy catgut. A clothesline can not be tied around a leadpencil as tightly as a linen thread can. The finest chromic gut should be used that permits us to properly set the second half of the knot. This varies with the individuality of the surgeon. Our rule is to omit drainage only when absolutely sure of our technic. If there is any doubt, we prefer to drain.

The use of the Murphy-drip and hypodermoclysis after abdominal operations is in nearly all cases an unnecessary nuisance. Just before the peritoneal suture is tied, the abdomen can be filled with fluid through a small rubber tube about a foot long, with a funnel in the upper end. Our routine is to use 1000 cc. but if a large tumor has been removed, much more fluid may be injected. This gives a very uniform absorption during the six or eight hours immediately following operation, just when it is most needed. About 5 per cent is actually excreted through the kidneys within one hour, and 60 to 80 per cent during the first 6 hours. This we have demonstrated by mixing 1 cc. of phenolsulphonphthalein in the 1000 cc. of saline and measuring the output at various intervals. The absence of postoperative thirst after this procedure is most striking and satisfactory.

Postoperative pain and especially gas pains are greatly reduced and sometimes entirely avoided by the careful infiltration of the parietal peritoneum with quinine and urea just before closure. Gas pains are due to preoperative cathartics, to traumatizing the bowel by rough handling, to the protective distension reflexly produced by any injury to the sensitive parietal peritoneum, and to tight adhesive strapping. This can be demonstrated by avoiding the first two, blocking the third by the prolonged anesthetic action of quinine and urea, and by cutting the adhesive as soon as it is tightened by abdominal distension.

Conclusion—Suffering, shock and morbidity may be reduced and convalescence shortened by applied physiology and the observance of the Golden Rule.

Volume 30 Number 4

#### SURGERY OF THE DIABETIC PATIENT\*

#### BY CHARLES GORDON HEYD, M.D., F.A.C.S., NEW YORK, N. Y.

T the present time the diabetic lives longer under less dietary restrictions and with under less dietary restrictions and with a better physical well-being than at any time in medical history. This very desirable condition was initiated before the days of Insulin but its completion was accomplished by Insulin. Coma, which formerly represented from sixty to seventy-five per cent of the mortalities of diabetes, has been eliminated. In the decade ending 1910 coma and tuberculosis were leading as the cause of death in diabetes and it is stated that the decade ending in 1930 will show that arterio-sclerotic conditions basically and surgical complications secondarily will account for the majority of deaths. Joslin is of the opinion that at the present time one out of three cases of diabetes is potentially a surgical subject.

The basic underlying factors in diabetes, so far as surgery is concerned, are represented in the following: (1) a lessened tissue resistance, (2) low reparative power, (3) an increased susceptibility to trauma, (4), in the extremities a progressive and continued sclerosis with diminished blood supply.

According to Joslin twenty-five per cent of the Boston diabetic death rate was due to diabetic gangrene and infection. Infection diminishes the ability of the diabetic to tolerate carbohydrates and lowers his previous glucose tolerance. Add to this the increased catabolism due to septic absorption and fever and a vicious circle is soon established. The small margin of stored glycogen is soon exhausted with an incomplete combustion of fats and the production of Ketone bodies. This phenomenon is most frequently observed in the mild or unsuspected diabetic who enters the hospital for an infection which in general surgical practice would be considered trivial but the effect of which in a diabetic is to change a mild condition into a fulminating and ofttimes fatal diabetes. Infection likewise lessens the protective possibilities of Insulin from fifty to seventy-five per cent. The value of giving Insulin lies in its ability to bring about the oxidation of glucose which in turn diminishes ketogenesis, and spares body protein. It is this breaking up of body protein in severe diabetes which is the ultra dangerous factor in the surgical complications of diabetes.

Winter, Smith, Pryde and Hewitt have demonstrated that the diabetic organism is incapable of oxidizing the glucose as it occurs in the blood but it can oxidize the simpler intermediate glucose products. Accordingly, if protein is catabolized the carbohydrate

derived therefrom is in the form of simpler intermediate glucose products which the diabetic can utilize.

Infection in the diabetic occasions the following: (1) the conversion of a mild diabetes into a severe type, (2) anticipates coma, (3) lessens Insulin protection, (4) represents a lessened resistance to infection and loss in reparative power.

The best surgical procedure to protect the diabetic in the presence of an infection is to increase the effectiveness of Insulin therapy by adequate surgical drainage. The retention of the products of infection in any tissue or viscus of a non-diabetic is always dangerous; the retention of the products of infection in a diabetic results not only in the inherent ravages of the infection itself but in a diminishing potency of the Insulin protection so that the Insulin protection in the presence of infection is only twenty-five per cent in its effectiveness as compared to the same dosage administered in the

non-infected diabetic.

Foster and Davidson state that as long as a serious grade of infection exists it is nearly impossible to establish a normal blood surgar and maintain it. It is surprising, on the other hand, how rapidly a patient establishes a fair carbohydrate tolerance when the infection is adequately drained or after an amputation has been performed. Therefore, the outstanding surgical consideration in the treatment of an infectious process in a diabetic is to provide adequate surgical drainage. Drainage alone in the uncontrolled diabetic is life saving whereas a more finished or complete operation would be unusually hazardous. example, the drainage of an infected gall bladder is less serious than cholecystectomy. diabetic patient, after the pus pressure of infection is relieved, can be brought into a condition of protection which allows surgery to be done later with relatively the same general surgical mortality as applies to the nondiabetic.

The untreated or uncontrolled diabetic has a markedly lessened ability to combat injury, infection or disease, while the controlled or properly treated diabetic obtains a markedly increased ability to combat the same conditions. In elective operations upon properly controlled diabetics the surgical mortality is approximately five per cent and is comparable to the surgical mortality in general practice.

It is an interesting observation that most frequently cases of diabetes complicated by surgical conditions come to us for surgical conditions primarily and their diabetes is picked up quite incidental to the surgical con-

<sup>\*</sup> Read at the Annual Meeting of the Medical State of New York, at Utica, N. Y., June 4, 174

dition. These patients are usually fat, their diabetes is mild and its detection an incidental discovery. We may therefore summarize the cases of diabetes presenting surgical conditions into: (1) non-infected cases requiring elective surgery-hernia, non-malignant tumors; (2) vascular cases that are not infected, (3) vascular cases infected, and (4) extraneous infections such as cellulitis, carbuncle, abscess of the breast, cholecystitis, appendicitis.

Arterio-sclerosis in some degree is always present in every case of diabetes and every diabetic is exposed to the dangers that arise from arterial disease. Dean Lewis states that diabetic gangrene occurs at the average age of fifty-four years, whereas the senile or arterio-sclerotic gangrene occurs at the average age of sixty-six years. Fundamentally, the process is the same, the diabetic exhibiting a precocity not present in the senile cases. Since the introduction of Insulin gangrene has become much less frequent. Many cases of impending or actual gangrene are prevented or controlled under adequate Insulin therapy.

In the non-infected vascular conditions of the extremities pain may be such an outstanding feature that amputation is recommended before gangrene appears. If on x-ray study the vessels are visible it may be advisable to anticipate amputation and it should be the object of every diabetic clinic to inculcate in the minds of the patients that the surgeon is really the friend of the diabetic. The diabetic can live with his diabetes and the surgeon is capable of removing the most pressing lethal factors in his complications. The emergency operations in diabetics should be done irrespective of the diabetes. There is greater danger in leaving a gangrenous appendix in order to treate the diabetes than to operate on the appendix and control the diabetes by immediate intensive therapy.

The greatest factor of safety for a diabetic undergoing elective surgical intervention is the utilization of carbohydrates with or without Insulin. By the giving of Insulin we can be sure that the diabetic does metabolize carbohydrates and the administration of carbohydrates to a surgical diabetic gradually eliminates the danger and promotes prompt tissue healing.

Ringer in a paper on Insulin in phlorhizin diabetes has demonstrated that one unit of Insulin causes the oxidation of two grams of glucose per hour. Therefore, it reduces the protein metabolism from its high diabetic level and causes a diminution or disappearance of the Ketone bodies.

Since the introduction of Insulin the development of hypoglycemia is sometimes confused with a beginning of coma. It is well to remember that the symptoms of hypogly-

cemia are a matter of minutes, are associated with cerebro-spinal irritation, without pain, without leucocytosis, and occur in a patient who is passing urine showing diminishing sugar and lessened acetone. Rest in bed, hot drinks, enema, glucose solution, will clear up the picture in a very short time. In addition, a half c. c. of adrenalin 1-1000, injected hypodermatically gives an immediate relief. It is well to remember that coma is initiated with suffering, requires hours for its production, is associated with gastro-intestinal upsets and epigastric pain. In the beginning of coma the symptoms may suggest a gangrenous gall bladder or an acute suppurative appendicitis, or a perforating gastro-duodenal ulcer. There is, in addition, the leucocytosis of acidosis which may range as high as 25,000 to 30,000 leucocytes and eighty to ninety per cent polynuclears. However, a catheterized sample of urine at two hour intervals should lead to the correct diagnosis as there is always an increasing degree of acetonuria previous to the onset of coma.

The surgery that is required in most diabetics is properly elective and the main objective to be accomplished by the surgeon is represented in the following: (1) To bring about an absence or lessening of glycosuria: (2) to obtain as a maximum a diurnal blood sugar less than 200 mllg. per cent: (3) lessen or prévent acidosis: (4) maintain carbohydrate feeding to increase the protective function by glycogen storage :(5) to give Insulin to maintain a protective balance, and (6) to relieve dehydration. Dehydration is the most serious accompaniment of most diabetics seeking surgery. Dehydration alone induces fever, fever produces vomiting with lessened intake, all tend to produce actual anhydremia. At least ninety per cent of the diabetics requiring surgery are dehyrated as the result of four factors: (1) glycosuria, (2) polyuria, (3) fever, and (4) sepsis. Their blood shows actually an anhydremia.

It would seem wise to have a daily fluid intake of 3,000 c.c. by mouth, rectum, skin or veins. A readily usable carbohydrate in the form of glucose can be added to the proctoclysis in the strength of five per cent solution or to the normal saline hypodermically up to five per cent strength.

The giving of sterilized glucose solutions untravenously introduces into the blood system "alpha-beta" glucose in solution. This is a type of glucose that cannot be metabolized by the diabetic as the only type of glucose that can be oxidized by the diabetic organism is the "gamma" glucose, or so-called new glucose.

It is wise to nourish the patient with small and repeated meals up to within two hours

before operation. The caloric requirements should be on the basis of 1,000 to 1,500, allowing approximately twenty-five calories per kilogram of body weight. Our diet, as a rule, has been based upon carbohydrates 100 to 120 grams, protein 20 grams and fat only to 15 grams.

Insulin should be given in the double daily dosage for three days before operation and immediately before operation ten units should ordinarily be given. The average Insulin dose has been ten units two or three times daily. Bicarbonate of soda has little, if any, place in the adequately controlled diet or treatment. Toslin has not used it since 1917 and reports better results than when it was employed.

The laboratory data to be canvassed before operation is a daily blood sugar determination and a daily plasma CO2 combining power. below 45 vol. per cent Insulin should be pushed with an initial dose of ten units and the urine tested q. 2. h and Insulin continued until sugar is markedly reduced and acidosis disappearing.

If anesthesia is contemplated the best is local, or spinal, followed by ethylene gas or nitrous oxide gas-oxygen combination. Ether is decidedly dangerous, as it increases the acidosis and it dissipates carbo-hydrates more freely and lessens the stored glycogenalways a small amount even in normal individuals.

The post-operative course of the surgical diabetic is represented in the early institution of feeding, the giving of high Insulin dosages and at the same time protecting the patient against Insulin shock by the administration of glucose. Immediately after operation we have usually given 800 c.c. N/10 Saline with five per cent glucose by rectum and ten to fifteen units of Insulin.

Dietary and Insulin control of the diabetic should always be in the hands of the proper internist. There is probably no condition where the internist and surgeon meet in more reciprocal relations than in the treatment of diabetes. It is a team work condition and it is quite obvious that the surgeon will ordinarily not be sufficiently trained or detailed enough in his experience to manage a diabetic with the full assurance of an internist.

## TRAUMATIC NEUROSIS FROM THE INDUSTRIAL POINT OF VIEW\* BY B. J. SLATER, M.D., EASTMAN KODAK COMPANY, ROCHESTER, N. Y.

LL physicians recognize that in the last analysis the traumatic neurosis represents some form of protective mechanism which may not be necessarily a protection from work but is always a protection from some unpleasant situation. Dr. Foster Kennedy speaking before the Seventh District Branch of the Medical Society of the State of New York at Geneva last year, drew attention to the well-known fact that the amount of trauma is no measure of the amount of neurosis which may develop. In other words, the two are never parallel. As a matter of fact it is apt to be quite the opposite; the greater the trauma the less the neurosis and the less the trauma the greater the neurosis. has been confirmed by our experience.

All will agree that no matter what the fundamental cause and no matter what promises to be the ultimate solution, that the traumatic neurosis is one of the most baffling of industrial problems. It taxes the resources of the physicians and industry. It is a disease the treatment of which to be successful must follow no rule of thumb.

After ten years experience in industrial work the author is convinced that the solution of traumatic neurosis is for the most part industrial and not medical. It is our experience that if a health-

ful state of industrial relations exists and if there is adequate cooperation between the employment department and the medical department and the industry, that there will be very much less traumatic neurosis than will exist if these conditions do not obtain. After all experience teaches us that men are more solicitous about their positions than they are about their health. It is safe to say that the average workman devotes ten times as much energy to promoting himself as he does to keeping himself in good health. To take advantage of this fact is often to grasp a great curative principle. If the relations between foreman and employee are healthful and there is loyalty to the industry there will be few cases of traumatic neurosis. This principle is being recognized on a large scale by many industries with the result that large industries are having stock dividends, wage dividends, and sick benefit for the employees, etc. In our experience in ten years at Kodak Park we have had three outstanding cases. There has been an average of seven thousand employees. other words, the traumatic neurosis have not been a great factor. As in other phases of health work emphasis should be placed on prevention rather than on cure. If employees share in the profits of an industry, are honestly treated and given a reasonable amount of work to do, they will not for the most part be often subject to

In the treatment of these conditions the first fundamental to consider is that the Neurosis after all is but part and parcel of another disease. This may be tuberculosis, cardiovascular disease, an obscure infection, syphilis, or perhaps, carcinoma. All treatments should be preceded by a most painstaking, thorough physical and mental or psychiatric examination. This should include Wassermann reaction, x-rays of the teeth, x-rays of the chest, urinalysis and, if possible, an electrocardiographic study. In other words, in so far as possible every effort should be made to discover an organic basis for the neurosis. This having been discovered the treatment of the organic condition becomes the treatment of the neurosis. It is surprising in passing to note the extent of disability caused by infected teeth. Indigestion so called is as every physician knows frequently not indigestion. Similarly traumatic neurosis is not traumatic neurosis at all.

M. C., a maiden lady, age 41 years, worked for the Company less than one month. On August 26, 1914, she slipped on getting off a stool, caught her foot, sustaining a slight laceration over the left eye. She was treated by her family physician and continued to work without interruption for nine days. Following this she began to develop symptoms of nervousness, flushing, extreme fatigue and extreme irritability. She was diagnosed traumatic neurosis and continued to draw compensation from 1914 until 1928. During this time she had been given examinations which were more or less of the usual Commission hearing type. Some physicians diagnosed her case as toxic goiter, others traumatic neurosis and still others, high blod pressure. Blood pres-

sure was  $\frac{190}{120}$ . She died in 1928 and an autopsy

was performed. This showed an extensive uterine carcinoma which had extended to the left kidney producing a pyelonephrosis. The kidney complication may, perhaps, explain the high blood pressure; the carcinoma explains the fatigue and irritability. The nervous mechanism may be explained by reasoning as follows: This employee received a slight injury. She was not in good health without any injury. Realizing that she was drawing a certain amount of money without working she continued to draw compensation for fifteen years. At the end of that time she died of cancer.

This case illustrates perfectly our first dictum. We were absolutely certain that we were dealing with a traumatic neurosis not an organic disease. In the light of the autopsy findings it is safe to say that the injury played almost no part in this woman's disability. The treatment of the traumatic neurosis after all was in all human probability the treatment of cancer. First of importance then is the diagnosis.

A second case illustrates the same principle from an entirely different point of view. We have emphasized the value of a complete physical and mental examination. Our first case illustrates the lack of a complete medical examination and the second case illustrates the lack of a proper psychiatric examination and its importance when established.

A white male, R. A., 21 years of age, was working in a sewer where the temperature was about 120 degrees. He was seized with convulsions after getting out of the sewer. Following the convulsions he remained at home for two or three days and again returned to work. night on returning home from work he had a convulsion on the street and was dragged into a neighboring doctor's office. Following the second convulsion his family claimed compensation on the ground that the boy had been poisoned by gas. After various vicissitudes in which he became progressively worse he was sent to a hospital where he received a very thorough physical examination and what appeared to be a very thorough psychiatric examination. He remained in the hospital four weeks during which time he was comparatively normal. He later returned home and visited the Medical Department. On entering the Medical Department he developed what appeared to be a typical Jacksonian epilepsy on the floor of the waiting room. He was hastily placed in a separate room and his case was demonstrated to the nurses as a typical Jacksonian epilepsy in which there was progressiveness in one foot, to the side of the body and later to the arm followed by twitching of the face. appeared to be complete unconsciousness. teen minutes after the convulsion the Babinsky was negative. Some neurologists have made a strong diagnostic point of the fact that a true epileptic seizure is followed by a positive Babinsky on the side of the seizure about fifteen minutes after the convulsion. This sign did not obtain in his case. He was taken to his home and seen the next day. On the following day he had generalized twitching on the right side of the body and was really in a pitiable state. The twitching was constant, coarser than that of a toxic goiter and not quite so violent as the Tacksonian type. He continued in this state for two days. The family and solicitous friends became very anxious about his condition and were most insistent that the Company correct the condition.

This obviously was no ordinary case of any type of gas poisoning. One physician whom the patient had consulted described it as monoxide poisoning. Incidentally in passing, it may be worth noting that he never was exposed to the fumes of any gas.

The patient was later referred to an internist. He made two visits to the internist's office. This internist while not specializing in psychiatry has appeared to have a great influence on certain psychic cases such as nervous breakdown, fatigue,

neurosis, vagatonia, etc During the course of the first consultation it developed that this patient was a victim of homo sexual practices A group of young men under the leadership of one older man had formed a club and it appears that our patient was being traumatized by an older homo-When the physician unearthed this condition the spasm ceased as did the neurosis This patient has apparently been restored to health and now holds a position in one of our institutions in Rochester Here we have an illustration of a traumatic neurosis developing on a psychiatric background which has nothing whatever to do This case for a time seemed with employment difficult, the most baffling and ununderstandable case that the author has ever seen Finally 1t turned out to be the most interesting and the solution relatively easy

Secondly, management from the industrial re lations point of view is most important. It seems a relatively simple thing to advance the dictum that all cases of injury should be under the care of the physician and the physician alone. This is a consummation easy to outline but very difficult to carry through. It has been our policy for some time to take entire charge of the care of the in juried employee. Practical benefits of this pro-

gram are as follows

In the event that a man has violated a company rule in his injury or has not followed the usual safety practices an overzealous foreman or an overzealous safety man may by visits to the employee directly after the injury or later on bring home to him the fact that he has violated a rule and will later on become subject to discipline No person should be permitted to indulge in these practices. The injury having been established during the entire course of treatment it becomes the duty of the physician to guard his patient from chastisement at the hands of anybody.

By and large the greatest factor in the cure of a patient is to get him back to work as soon as possible. We have heard in the literature a great deal about occupational therapy and rehabilitation therapy However, our experience has taught us that industrial therapy or the return to some form of productive work is the greatest assistance in bringing the neurotic back to normal life and activities Careful coaching along the course of industrial management will frequently enable the physician to get employment for him who would otherwise not be given employment The large industry has a tremendous advantage Practically always some productive form of employment may be found. This does not always mean a menial task The elevator job after all should not be looked down upon as it furnishes an avenue of social contact with many people The injured man in brushing against his fellow employees develops a sense of social well being which for the moment may let him forget his own troubles

Those of you who are not attached to the larger industry may say that this program is applicable to the larger industry but is in no sense applicable to the smaller industry there are certain avenues of approach to the smaller industries which may be fruitful of good The attitude of some may be different in the smaller industry. We want only such men back they may say as are able to do their work without fear or favor There must be no cripples or misfits in this department This, after all, is the opinion of the Top Sergeant but is not ever the opinion of the commanding general If the physician will take the pains to call up the Manager of the Company even though it is a very small company and tell him the importance of getting a man back to work from the psychic point of view, I doubt if he will ever have diffi-He may be bluffed by the understudy but he will usually find the manager very sympathetic to his point of view

This is true for several reasons The physician through his standing in the community is entitled to respect and no manager of any company wants to admit to a man of his quality the fact that he is not willing to give a workman a fair show The physician's prestige may help him a great deal It may be pointed out to the manager that after all the ultimate cost does not come out of the insurance carrier
falls on the industry
The ultimate cost always
This the small man doesn't know but it is perfectly obvious to the manager When a physician meets with an individual in the employment of the company who is not giving him cooperation almost without exception it is our belief that he will get such cooperation if he will take the trouble of interviewing the manager of the company for whom the injured man is

employed

Proper industrial placement is the keynote in the treatment and cure in the traumatic neurosis

The physician himself should be meticulous in never finding fault with the manner in which the accident was sustained, should confine himself entirely and solely to treatment and should avoid any reference to a violation of any rules and should carefully avoid any reference to any carelessness on the part of the injured man Remembering our dictum that bad industrial relations may produce a neurosis, this is the first step that the physician may take to protect the injured man from the development of such a neurosis only common sense and common experience to know that no man is going to make a great effort to get back to work if on returning to work he expects to be laid off or expects to be chastised or to receive some other form of punishment for anything which he may have done

We have seen not one case but dozens of cases where a neurosis was developing. The fact that some form of antagonism was developing in its very incipiency was sensed by our medical de

partment. This having been discovered we have spent hours of time to run down the cause of this irritation and frequently it has been found to be due to overzealous friends of the company who have endeavored to protect the interests of their particular department at the expense of the injured man. When the difficulty was unearthed the physician frequently gave a promise which was iron-clad and inflexible that as soon as the man felt that he was able to return to work that we would see that work was provided for him and that whatever faults he may have exercised in being injured would not be used against him. In every instance a promise having been made was religiously lived up to. The physician by apprehending in the very incipiency these illustrations of strained industrial relations and correcting them with the support of the employment department, can do more to prevent the formation of neurosis by this method than by any other form of subsequent treatment.

The third consideration is the actual management of the patient himself. It is almost never our policy to tell a patient when to go back to work. We almost always ask the patient when he thinks or when she thinks he will or she will be able to go back to work. Our results by this method, we believe, to be much better than by commanding a patient to return to work on a particular day. Many times we may ask, well knowing that the answer may reasonably be in the indefinite future. If the patient does not return promptly but desires two or three more weeks we almost never raise an objection even though we appreciate that the patient may be taking advantage of us. It is short sighted policy to raise an antagonism with the patient over a question of a week or two as measured by the cost of the neurosis which might develop in the event that the patient does not get what he wanted. Under this regime the patient will not return to work before he himself has said that he was able and he will never develop the feeling that we have been responsible for hurrying him back to work.

Under the compensation law to the employer is given the care and treatment of injured employees. If a physician indicates early that he is willing to have consultation and that he recommends it, it will do a good deal to sustain confidence in the injured employee. Many physicians make the mistake of never seeking outside advice. It is often well to ask the patient what he would like to do; if there is any other physician that he would like to consult; if he would like to take a vacation or if there is any instance in which the company may cooperate with him and arrange the program to suit his desires. This often may never be accepted but is a powerful psychic stimulant in bringing home to the patient that after all the treatment of his case is not by interests which are closed to outside influences; that he is being humanly considered and there is no dis-

position to cover up anything that is wrong with him. Consultations are of great benefit to the family and friends many of whom may have their special consultant. While the consultation may disclose methods of treatment or pathology which were not previously recognized, if none of these things are accomplished there is a great restoration of confidence. If the case is prolonged it should be followed by subsequent consultations.

In the beginning of this paper it was pointed out that the extent of the injury bears no relation to the neurosis which may develop. On the other hand it is surprising under proper industrial management how successfully many disabling cases may be treated apparently to the social betterment of the patient.

An Italian boy, P. P., five years ago fell sixtyfive feet from the top of a building to the basement striking against a concrete construction on the way down. He sustained a hemo-thorax, compound fracture of the humerus and very nearly died. Infection developed later in the head of the humerus which had to be removed. This left the employee with one useful arm. An Italian boy with one useful arm who is a laborer is after all a sorry spectacle. While compensation is paid only for the loss of an arm, lacking suitable education and social standing, this injured man will find great difficulty in finding placement in another industry.

In his particular instance before returning to work he showed many nervous symptoms. There was great anxiety and his case necessarily was prolonged. However, he later was placed in a check-up position where it became his duty to see that material was furnished to new construction jobs, that the odds and ends were promptly provided and that work was making satisfactory progress. This employee now has a steady position. He has been promoted from the laboring class to the supervising class and is a very trusted employee. He is now earning higher wages than at the time of the injury and is in every way shouldering his responsibility as a useful worker. Realizing the consideration shown him he has developed a very intense interest in his position. The author has been assured that he is a very valuable man to the company. This is an illustration of reconstruction and rehabilitation through new employment of a different type. It has resulted in higher wages and good will on the part of all concerned. If this employee had been handled differently there is little doubt but that he might have developed into a neurotic. Incidentally he may have been a charge on the basis of traumatic neurosis against the company. In proper industrial placement we thus have solved not only his problem but given the company a useful employee and have lowered compensation costs to the detriment of nobody.

Another illustration is that of a white male.

Five years ago this employee fell twenty feet and suffered a double fracture of the oscalcis complicated by a communited fracture of the 12th dorsal vertebrae. When it is recognized that a single fracture of the oscalcis almost uniformly means a disability of forty per cent of the leg and that a double oscalcis would mean forty per cent of each leg with the added disability from the fracture of the vertebrae, we will see that the problem of getting this employee back to work was a difficult one.

As a matter of fact he was turned over to an orthopedic specialist in Rochester who performed a fusion of both oscalcies. He was given prolonged treatment on his back with fixation for the vertebral fracture. On getting on his feet he was a pitiable sight. It required a great deal of patience and sympathetic handling to restore con-

fidence in himself,

It was obviously impossible to place this man in construction work. Realizing the impossibility of this task and the fact that we would have a permanent invalid on our hands, together with the humanitarian appeal of the injured man, he was placed in a department of the company, namely, the projection room in which he had had previous experience. Compensation awards were made for partial loss of function of each This man has continued to work without interruption for four years in the projection room of the company. He has become a very trusted employee; has suffered no further disability and has lost no more time. During his stay in the hospital he developed in addition to his injuries an out and out case of mania. It was very difficult to handle. As a matter of fact this employee is now earning higher wages than he did before and is losing no time from his work.

In the industrial placement of these injured employees one fact stands out clearly. times an injured employee having been given employment will make an extra effort to make good in his new position. This is because he recognizes that it will be difficult to seek employment elsewhere and having been given a chance is under the added urge of making good. These two cases illustrate, one in the case of an Italian boy and the other in the case of an ordinary laborer, the point that no matter how badly a man may be injured he may still perform useful work and come to occupy a position, because of the injury, of greater responsibility in the company and greater satisfaction in himself. Other cases might be cited of the proper placement of injured em-This is particularly true in back injuries. So far as the author is concerned such placement promises the only solution of many baffling back injuries. No treatment will ever restore many of these injured employees to heavy labor. They must be given protected occupations and if given such may go on to become very useful employees. Thought spent in this direction is productive of great good not only to the injured employee but to the company. It establishes an attitude of fair play toward the injured employee; sustains his confidence and becomes an object lesson to other employees who are associated with him. It develops in them a spirit of loyalty. The community thus does not witness the sad spectacle of an injured man thrown on the streets an object of charity or diminished income from compensation. These principles are larger than any considerations of compensation and curiously enough frequently work to the betterment of all concerned.

It is exactly this point with meticulous care to details that many physicians fall down in understanding the psychology of the patient. In other words, we must work on the assumption that the patient is exactly the type of individual that we are. There are very few of us who will not do more if left to our own discretion than if commanded by somebody who may or who may not have the authority to command us. In this connection we might say that it is the rarest thing for us to indulge in an argument with the patient. The attitude that the patient is always right becomes very nearly the attitude of choice.

We might introduce here one broad principle which has worked wonderfully in two instances of what threatened to be bad traumatic neurosis. In one case a man suffered a broken tibia. The reduction was perfect immediately following the injury. Later he fell out of bed and refractured the bone. On second reduction the result apparently was not as good. No amount of persuasion would get us to permit this particular individual to take another anesthetic with the result that the leg was treated as it was. After three months the patient still complained. He was given a position of watching a gate. continued in this position for two months. During all of this time being centrally located if an injured man walked by he pointed to his leg indicating what kind of work might be expected from us in the matter of treatment. The case dragged along for a total of six months to the discomfort of all parties at interest. Finally recognizing that sufficient callus had been formed a resourceful foreman suggested that we promote this watchman from gateman to straw boss in his former department. He was given the position of straw boss and immediately on resumption of this position continued to work. For the last four years since returning to his new position he has not lost one day's work because of his limb. As a matter of fact three months after returning to work he won first prize in a departmental picnic foot race, namely, the one hundred yard dash. On the same leg three months previously he could scarcely walk. The difference lay in industrial placement. In one instance he was a foreman; in the other he was an underling and the difference in this case was

the difference between complete disability and no disability at all. Today this employee is one of the most trusted foremen in our plant. All this shows the applicability of psychology in the management of these cases for the most part industrial and not medical.

There is one peculiar form of Traumatic Neurosis that the general practitioner perhaps, seldom sees. It is more peculiar to certain types of industry, namely, the Chemical Plant. It has been the author's privilege to make an intensive study of one case, namely, that caused by nitric acid fumes.

It has been recognized for some time that carbon monoxide poisoning is often followed by a lesion of the midbrain which resembles the lesion produced by lethargic encephalitis. The same has been said to be true of cases who inhale nitric acid fumes. There is something very peculiar about the effects of fumes. We recently witnessed the suddenness and the terribleness of the consequences. There are, however, some sequellae which take the form of a neurosis which are very difficult to deal with. Patients may develop a fear of a plant, fear of the industry or fear of living.

One of our cases having been gassed in 1925 died in 1928. Between the time of gassing and the time of death he was at no time a normal individual. He suffered from fears and obsessions of various types and finally died of cardiorenal disease. Whether or not the obsessions which he developed were part and parcel of gassing or necessary sequellae of advanced renal disease is difficult to say. Authors in industrial medicine speak of the neurosis following gassing They are particularly difficult to treat. In handling these cases the greatest appreciation must be made of the broad philosophic background which should accompany a study of the treatment of traumatic neurosis.

We have in each of our gassing cases succeeded in getting our employee back to work. In one case it was two years before the individual developed enough confidence to want to return to his own department. Had we not substituted

another department it is hardly to be believed that we would ever have got him back to work. This case illustrates again the value of industrial placement. It may be that the horrors of the gassing in the war have been brought home to some individuals through newspaper accounts. It is safe to say that those individuals in the future who become gassed by nitric fumes will probably be much worse off than if they had not been familiar with the results of the hospital fire in Cleveland.

Another form of traumatic neurosis is that following injuries to the head in which it is claimed by some authors that there are minute petechiae hemorrhages in various portions of the brain. These, it is claimed, in the brain finally produce the condition known as "punch drunk" or the "goofeys." This condition is familiar to prize fighters. Just what its industrial application is, is hard to say. It probably plays a minor role in certain head injuries. It is extremely difficult to prove or disprove. Recent information, however, and study of brains of prize fighters has been very stimulating and may lead the way to further investigation of the sequellae of head injuries.

It is a good broad general principle to see all traumatic neuroses often; to give many treatments. Manual massage is, perhaps, the best. Any treatment which is automatic and which does not bring the patient in close contact with the physician does not serve its purpose. It is our custom to use baking and massage and heliotherapy only.

Summarizing, many cases of traumatic neuroses are not neuroses at all. A careful and complete physical examination and psychriatric examination often repeated should accompany treatment. The greatest tact should be shown by the physician and he alone should have charge of the patient. No industrial conflict should be aroused nor permitted. The patient should be returned to work as quickly as possible but he should not be hurried back if antagonistic to a hurried return. In proper industrial placement lies the key to success in treating these cases.

# THE PREVENTION AND TREATMENT OF PNEUMONIA\* BY RUSSELL L. CECIL, M.D., NEW YORK, N. Y.

THE topic which has been assigned me for this address is a large one, too large indeed to be adequately covered in such a short space.

The prevention of pneumonia is really dependent almost entirely on the prevention of the milder respiratory infections. In our statistics at Bellevue Hospital, we have found

Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

that a surprisingly high percentage of all patients with lobar pneumonia gave a history of a preceding sorethroat, coryza or influenzal attack. Sometimes it has been an acute tonsillitis or a sinus infection which has preceded the pneumonia.

With respect to common colds, I have long been convinced that autogenous vaccines taken every week or ten days throughout the winter and spring are of great value in their prevention. Whether this should be considered a specific or a non-specific form of therapy

I am not prepared to say.

During the war, those of us who were studying pneumonia in the army camps became interested in vaccination against the fixed types of pneumococcus pneumonia by means of a pneumococcus vaccine. This vaccine, as many of you will recall, was tried on large groups of soldiers and appeared to have definite value in preventing the more serious forms of lobar pneumonia. While pneumococcus would undoubtedly have an important part to play in case of another war, its usefulness in civil life is not so obvious. However, I strongly advocate the use of a polyvalent pnemococcus vaccine for patients who have had several attacks of penumonia and live in constant dread of still another attack. Pnemococcus vaccine is also indicated for elderly patients who suffer from winter bronchitis, as a prophlactic against the more serious pulmonary infections.

Today it seems that we might make better use of the short time allotted to this discussion if we considered more particularly the recent advances in the serum treatment of pneumonia.

The efficacy of Type I antipneumococcus serum in the treatment of Type I pneumonia has been established by clinical, experimental and statistical evidence. In spite of its clinical value, however, it has never come into general use, chiefly because of the practical difficulties which are encountered when one attempts to employ it in private practice or even in small hospital work. For this reason chemists and bacteriologists have been striving during the past few years to purify and concentrate antipneumococcus serum, in order to elminate to some extent the dangers of serum reactions and to reduce the bulk of serum necessary to obtain good therapeutic results. Furthermore, efforts have been made to extend the use of serum to the other types of pneumococcus pneumonia.

Huntoon's polyvaient antibody solution is a water soluble extract of immune bodies removed from antipneumococcus horse serum. This product contains immune bodies against penumococcus Types I, II and III, but not in concentrated form. The chief advantage of Huntoon's antibody solution is its entire freedom from horse protein, a fact which makes it available for pneumonia patients even when they are highly sensitive to horse protein. The disadvantages of Huntoon's antibody solution are its lack of adequate potency and its tendency to produce sharp chills when injected intravenously.

The most recent effort to refine and concentrate antipneumococcus serum is that of

Lloyd Felton, who precipitates out the immune bodies from antipneumococcus serum by means of ammonium sulphate or distilled water, and redissolves them in a concentrated solution. Horse protein is present in small quantities. Immune bodies against pneumococcus Type I and Type II are present in high concentration, usually five to ten times as great as that of an ordinary Type I or Type II serum. Felton has worked out a method of standardizing refined serum in units, the unit being that amount of serum that will protect a mouse against a million lethal doses of virulent pneumococcus culture.

The polyvalent Felton serum contains on an average of 2000 units against Type I and 1000

to 2000 units against Type II.

The experiments on animals are very satisfactory, particularly in the case of Type I pneumococcus. One can give monkeys perfectly classic lobar pneumonia when pneumococcus Type I is administered intratracheally. If after the disease has progressed for a day or two, intravenous treatment with Felton's serum is begun, invariably the blood is sterilized, the temperature begins to come down and the monkey gets well, while the control monkeys die. It is a very satisfactory method of testing out the value of these specific agents, one that we use a great deal in research work.

We have tried to develop in Bellevue Hospital a reliable method of determining the therapeutic value of these products. We take every case as soon as the diagnosis of lobar pneumonia has been made, and that case is given a number. About 500 lobar pneumonias a year are admitted to the twelve medical wards at Bellevue. The even numbers get Felton's serum as soon as the diagnosis of lobar pneumonia is made. The odd numbers get no scrum, but in other respects are treated in the same way. It is very important to get the serum treatment started as soon as possible.

The "typing" of the sputum is one of the most important parts of our work from the scientific point, because it enables us to know what we are doing in each particular case. In private practice, typing is not absolutely essential, but it is valuable information to have. In research work it is essential to have accurate typing, and even with the best typing in the best laboratories, with specially trained people to do it, there is probably an error of five to ten per cent in the reports. The only way to overcome this error is to have repeated specimens examined and checked up with the blood cultures, cultures from pleural exudates, urine precipitin tests, and so forth.

Tests for hypersensitiveness to horse serum are made before the scrum treatment is started. We may do an intradermal test, but nowadays we usually perform an ophthalmic test, because the ophthalmic test is less sensitive than the skin test. The patient is asked if he has had asthma or hay fever or ever received serum of any kind before. The ophthalmic test will generally indicate whether the patient is very sensitive. If he is sensitive, we proceed with the greatest caution, giving very small doses of serum subcutaneously to desensitize the patient. If the patient's history is negative and the ophthalmic test is negative, we proceed at once to give 5 c.c. of Felton's serum intravenously, watching the patient to see if any symptoms of anaphylaxis develop. After the 5 c.c. has been given, we give larger doses, and try to get in 50 to 75 c.c. of Felton's serum on the first day of the patient's stay in the hospital. On subsequent days, the number of injections is governed by the condition of the patient. If there is a rapid drop in temperature and improvement in the patient, the dosage on the second day would be much smaller. The average individual dose is 10 to 20 c.c. intravenously.

Occasional reactions have been noted. It is a well-known fact that the intravenous injection of any kind of serum or serum-derivative will occasionally cause reactions. The chills that sometimes follow intravenous injections of Felton's serum are caused by a foreign protein. We now discard the lots of serum that give chills, or send them back for repurification. Most of the lots now come in perfect condition and give no reactions of a foreign

protein nature. The other reactions are the hypersensitive reactions in patients who are allergic to horse serum. We have had a few anaphylactic reactions. A syringe of adrenalin is always at hand so that if the patient breaks out with urticaria or begins to get a little cyanosed, the adrenalin can be administered at once. We have not had any fatalities in the 414 cases treated with Felton's serum. There has been a smaller incidence of serum sickness than with the original standard Type I serum. Serum sickness was noted in 10 to 12 per cent of cases and seemed to depend a good deal on the amount of serum which the patient received. Patients who get a large amount of serum are very likely to develop serum sickness a week or two weeks after the injection.

In administering serum to the patient, the immunologist is trying to sterilize the blood in pneumonia. These serums are not antitoxic. No toxin has been isolated from the pneumococcus; there is no antitoxin against the pneumococcus. These specific agents that are being tried out in penumonia are antibacterial. Their function is to increase the agglutinins, precipitins and opsonins in the blood, and to hasten phagocytosis of the pneumococci.

In the typical case of Type I penumonia the crisis appears on about the seventh day, and at the time of the crisis the patient begins to develop immune bodies in his blood. That is what happens in all types of pneumonia with recovery. The patient, whose blood has been free from any evidence of immune substances, about the time of the crises or shortly after, begins to develop these immune bodies. If the blood culture has been positive, the immune bodies rarely appear until the bacteria disappear from the blood.

The object in giving serum to any type of pneumonia is to help Nature establish a balance of immune bodies in the blood in order that it will be impossible for pneumococci to circulate there. We have learned that with rare exceptions, penumococci and immune bodies do not circulate in the blood at the

same time.

The patient with pneumonia needs a great deal of help; he needs more help relatively speaking than the patient with diphtheria or scarlet fever, because he has a very large infected area. The diphtheria patient has small patches in the throat, and the scarlet fever patient has a red throat infected with streptococcus. Compare these small localized infections with a man who has three lobes solidified with pus and innumerable pneumococci. It is much more of a problem to overcome such an infection than it is to control infections such as scarlet fever and diphtheria.

In pneumonia, the death rate in patients with positive blood cultures is much higher than in patients with sterile blood cultures. In a total of 107 patients at Bellevue Hospital, the mortality was 78.3 per cent where the blood culture was positive, as against ten per cent where the blood remained sterile.

In respect to the clinical effects of concentrated serum, it may be stated that the administration of the serum early in the course of the disease frequently causes a striking drop in the temperature and a general amelioration of the patient's symptoms. In the cases of Type I pneumonia treated within two days after onset, this is the rule rather than the exception. In cases treated later than this, the clinical effect is not always evident. If, however, the particular lot of serum used is highly potent in Type I or Type II antibodies as the case may be, the clinical effects even in cases admitted on the fourth or fifth day of the disease may be quite impressive.

The effect of concentrated serum on the death rate in pneumococcus pneumonia is indicated in table 1, which is a summary of 885 cases of pneumococcus pneumonia observed in Bellevue Hospital. Altogether, 441 patients with pneumococcus pneumonia were included

in the serum treated group.

The most striking results were obtained in the pheumococcus Type I series In 153 treated cases the death rate was 206 per cent while the control series of 147 cases showed a mortality of 326 per cent. Among the pneumococcus Type II cases the results were not quite so striking, but even here there was a decided difference in the mortality for the treated and untreated cases 415 per cent for the treated series as compared to 545 per cent for the untreated cases. In the pneumococcus Type III cases, serum did not have any beneficial effect. Indeed, the death rate was actually higher for the treated group (400 per cent for the treated, 286 per cent for the un This apparent anomaly in the Type III mortality rates is probably due to the presence of an unusually large number of chronically ill patients in the Type III treated series miscellaneous group IV cases, serum appears to have had a beneficial effect. In a large group of treated cases the death rate was 282 per cent, is compared with 383 per cent for the untreated cases. This may be due, however, to factors other than serum which modify the death rate of lobar pneumonia

The death rate for the entire group of 441 treated cases was 30 per cent, while in 444 untreated cases there was a mortality of 392 per

The death rate for untreated patients admitted di ring the first three days of the disease is con siderably lower than the death rate for untreated patients admitted during the first three days of the disease Treated patients admitted after the first three days of the disease show a con s derably lower death rate than untreated pa tients admitted after the first three days of the disease, Type III excepted Our statistics show that the death rates for treated patients admitted during the first three days of the dis case are distinctly lower than those for the en tire untreated series. This is most marked in the Type I group, in which the death rate for treated patients admitted early is approximately one third of that for the entire group of untreated Type I cases It is also interesting to note that the death rate for treated patients with Type II pneumonia admitted early was only 346 per cent, as compared with a death rate of 546 per cent for the entire group of untreated Type II cases In other words it would appear from these figures that if patients with Type I and Type II pneumonia were admitted early and treated carly with serum the death rate for Type I pneumonia could be cut to one third of the present figure, and that for Type II to almost one half of the present figure

The death rate in both the treated and the unticated series is lower patients under 40 years of age than for patients over 40 years of age Relatively speaking, however, serum treatment appears to be just about as effective in middle aged and elderly patients as it is in vounger patients Statistics were also prepared to determine how effective serum treatment was in patients with chronic systemic disease or with a history of chronic alcoholism. These figures were very similar to those for the two age groups, that is, the death rates in both treated and untreated groups were lower for those with previous good health than for those with a history of systemic disease or chronic alcoholism The relative reduction in death rate, however, was approximately the same for the chronically ill as for those who had always enjoyer good health

Now that we appear to have a potent, effi cient serum for the treatment of Type I and Type II pneumonias, what should be the actual mode of procedure on the part of the general practitioner who encounters a lobar pneumonia in his private practice? By another winter the serum will be available for all, as it is now being manufactured on a large scale Should antipneumococcus serum be administered as a routine in every case of lobar penumonia, or should the physician wait until he has received a report on the pneumococcus type from the clinical laboratory? If one pursues a radical policy and gives serum to every case of penumonia before getting the sputum report, he will give serum to a good many Type III and Type IV cases that presumbaly will receive no benefit from such treatment. On the other hand, if he waits until the sputum report is received and then treats only Type I and Type II cases, his course of action will be more scientifically correct, but the patient with Type I or Type II pneumonia will have lost nearly twenty four hours of valuable time Fortu nately there is every prospect that this prob lem will soon be solved Rapid methods of sputum typing are now being worked out, notably the one by Sabine at the Harlem Hospi tal, which will give an accurate report on pneumococcus type within three hours after the sputum is sent to the laboratory Until these rapid methods are in general use, however, we would advise a radical policy with regard to serum treatment in young adults in the twenties and thirties, and a conservative policy in patients over forty. In young pa tients, about two thirds of the pneumonia will fall into the Type I or the Type II group In middleaged and elderly patients, about two thirds will fall into the Type III or Type IV group As there is no serum for Type III or Type IV pneumonia it is probably better practice to withhold serum from middle aged patients until the laboratory has made a report on the sputum

## Summary

Refined antipneumococcus serum is a purified and concentrated derivative of ordinary antipneumococcus horse serum. It is usually prepared in a polyvalent form, containing immune bodies against Types I and II.

When concentrated serum is injected early into patients with pneumococcus Type I pneumonia, a striking clinical effect is usually obtained. The pneumococci disappear from the blood and the temperature falls rapidly to normal. Even in more advanced cases, good results are often obtained. In Type II penumonia the clinical results are not so impressive, though even in this type of infection, when patients are treated early, favorable results are often noted. In Type III or Type IV penumonias, no beneficial result is obtained.

In a series of 153 cases of Type I pneumonia treated with refined serum at Bellevue Hospital, the death rate was 20.9 per cent, while the control series of 147 untreated cases in the same hospital showed a deathrate of 32.6 per cent. A definite, but less marked effect, was

observed in cases of pneumococcus Type II pneumonia that were treated with concentrated serum. The serum had no favorable effect on pneumococcus Type III pneumonia. In Type IV pneumonia, the death rate was lower in the treated than in the untreated series, but factors other than serum may have been responsible.

## A SIMPLE METHOD OF TUBAL STERILIZATION\*

BY ELIOT BISHOP, M.D., and WM. F. NELMS, M.D., BROOKLYN, N. Y.

From the Department of Gynecology and Obstetrics of The Brooklyn Hospital

This brief paper which we will illustrate by pictures, still and moving, is purely one of technic. The subject of sterilization in its broad aspects—moral, ethical, social and medical has been handled by abler pens than ours. Two of the most recent are by Williams<sup>1</sup> in the Journal of the A. M. A. for Oct. 27, 1928 and by Dickinson<sup>2</sup> in the New York State Journal of Medicine, May 15, 1929. Neither will this paper take us through the history of even the technical aspect, though we will append some bibliography of the results of different methods.

To return—any surgical procedure should exhibit three principles which we will align alliteratively: Simplicity, Safety, Security. We can easily demonstrate to you that the procedure which we present is *simple*. It would seem also as though it must be accepted as one which is as *safe* as any invasion of the peritoneal cavity. As to *surety*, we will state that there is no known case of ours that has become pregnant.

Taking up each aspect separately, we want to state that its extreme simplicity has possibly kept it from becoming more popular. Our earlier work followed that originated by the late August Hussey which buried the cut stump of the tube and also covered the raw

area in the broad ligament and the uterine cornuum with a combined ligature and suture ingeniously applied. No pregnancy followed its use as far as is known, but at times annoying bleeding occurred necessitating complete salpingectomy for its control.

The method we are advocating we first saw in the hands of the late Ralph Pomeroy who made no claim for originality but stated that he had never seen it done. Its simplicity lies in the fact that it is nothing more or less than that a loop in the loose, middle portion of the tube is ligated with absorbable suture material and resected. It takes but a few seconds during a laparotomy and usually no longer by vagina. Its similarity to and its difference from Madlener's method we will refer to later.

So much for simplicity. As to safety, hemorrhage and infection are yet to be feared in any operative procedure. As to the latter, the chance of latent infection being present has scarcely entered our heads, for a tube to be functioning is presumed to be healthy and non-infecting. However, if desired, the cut ends may be cauterized by heat or a chemical. As to hemorrhage, the vessels that are apt to be involved are ligated before section, so there ought to be only a few drops of blood loss. By the vaginal route there is

<sup>\*</sup>Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

some chance of laceration of the tube during its delivery, but no more than in any other vaginal method of tubal sterilization. We feel that we must be supported in our contention of simplicity and safety.

As to surety, more proof will be needed and that is not so easy. Incomplete as this report may be, we are bringing it forth to stimulate more use of this method so that it justly may be followed or condemned. what way does this procedure give assurance of sterilizing? The first critical thought is that we use absorbable suture material, which indeed we do, our practice having been to utilize a double strand of No. 1 chromic catgut. No absorption occurs until there is no fear of bleeding and when it does the two cut ends draw apart as we have noted in two subsequent laparotomies and we will show on one of our experiments. During this period the plastic exudate of the peritoneum has been thrown out and become organized, and here is the secret of the process. Nature throws over a barrier of new peritoneum and it becomes a permanent one with no chance, we feel confident, of fistula formation.

We definitely do not crush the tube first as has been advocated by Madlener and others, for the crushed tissue may open a way for fistula formation; we definitely do not use non-absorbable ligature material as that very material, we fear, might slough through and a fistula develop. Nature through her eliminative mechanism tends to absorb a disused organ and we feel in this procedure that the two portions of each tube steadily shrink up to a narrow strand even possibly closing the lumen. We will show a slide of an x-ray picture of a uterus whose tubes have been ligated and two years subsequently injected with sodium iodide and the material does not leave the endometrial cavity.

As to clinical results, as near as our records can be found we have done this about 60 times, there being no record of a pregnancy. Follow-up by letter and telephone has given us, as far as we have been able to achieve it, no report of a pregnancy and no use of contraceptives. A personal communication with Dr. R. M. Beach supplements this with about 40 additional cases with no reported pregnancies. On a dozen animals—guinea pigs and cats—which are known to be prolific and with frequent periods of rut, we also have found no pregnancies.

In reviewing the literature of this subject there are so many various methods of operation which have been used that we will not have space enough to include them all. We are concerned only with those performed upon the Fallopian Tubes as this is the title of the paper. One is struck by the great number of failures reported following all kinds of tubal ligations and resections, but it is interesting to note that the material used in the vast majority of these cases has been a non-absorbable suture—usually silk.

Littig<sup>3</sup> gives a thorough survey of the literature of this subject up to 1912 citing all of the methods used up to that time and shows the discouraging fact that failures have occurred with all of them. He concludes: 1that animal experiments, the ligation or excision of pathological tubes, and the results of like operations on normal tubes prove conclusively that tubal ligation with or without excision is not an efficient measure to prevent conception; and 2-the only operation which gives promise of success is excision of all or a part of the tube with a deep, wedge-shaped excision of the uterine cornu, including the pars uterina of the tube, the defect to be closed with a musculo-muscular and a seroserous row of sutures

Some of the most commonly used methods

reported since the above article are:

1st. By Kohler who loops the tube in its middle portion, ligates with silk sutures and cuts off the loop.

2nd. By Peitman<sup>5</sup> who ligates the tube with silk in two places about two cm. apart, splits the peritoneum exposing the tube, excises a section of the tube between the ligatures and then sews the split peritoneum over this with fine silk sutures. He calls this "Subserous partial tubal extirpation."

3rd. By Rabinowitz<sup>n</sup> who does just as Peitman except that he sews the ends of the cut tubes with silk and buries the uterine stump

in the musculature of the uterus.

4th. By Planner who ligates doubly with silk, cuts between the ligatures, sews the ends with silk and buries the uterine stump in the broad ligament.

5th. By Hofbauer' who cuts the tube, ligates the proximal end with silk and approximates the round and ovarian ligaments over the stump.

6th. By Madlener who loops the tube, crushes it together with the mesosalpinx and ligates with silk or cat-gut sutures.

7th. By Williams<sup>10</sup> whose routine method is to excise the proximal end of the tube from the uterine cornu by a wedge-shaped incision, carefully closing the wound with fine sutures.

As to results we have been unable to find statistics showing the number or percentage of failures for each specific method used. According to Kohler<sup>11</sup>, 21 cases of pregnancy after tubal sterilization have been reported in the literature, most of these having been collected by Nurnberger. Sarkissiantz estimates the failures after bilateral ligation and resection

at 1:3000. On the basis of cases reported in literature 6.5%. In Doderlein's Clinic from 1908-1918, 67 tubal sterilizations were performed with 4 failures or about 5.97%. Failures after single or double ligation of the tubes according to Kalliwoda's calculation (based on 75 cases collected from the literature) numbered 14 or 1/5 of the cases.

Madlener<sup>o</sup> reported 89 cases by his method

all of which were successful.

Von Waser<sup>12</sup> reported 225 cases sterilized by Madlener's method with one failure. In 1926, 39 cases had been added to Madlener's first series making in all, excluding 4 deaths, 124 cases with no failure. Keller reported that of 15-20 cases operated on by Madlener's method only one failed. Schreiner13 reports 142 sterilizations by Madlener's method with no failures. Nurnberger<sup>14</sup> reports 6 or 7% failures following the operation in which a wedge at the horn of the uterus is removed.

In conclusion, while we can not state positively that sterilization by our method, will give a better percentage of results than those reported above, we believe so for the follow-

ing reasons:

- 1. In a series of 100 cases no known pregnancies have occurred.
- 2. Our use of absorbable suture material is not as likely to cut through the stump.
- 3. The fact that we have seen (in subsequent laparotomies and in experimental cats) that the two cut ends of the tube have separated and become covered with peritoneum.
- 4. Sodium iodide tubal patency tests have shown the fluid to be confined to the uterus with none in the peritoneal cavity.

#### RECORDS OF SOCIETY ACTIVITIES

It is gratifying to receive appreciations of the department of News Notes in this Journal, for they show not only that the medical societies are active along progressive lines, but that their members are interested in the practice of medicine by the societies. The department recently has consisted of over ten pages in each issue, while the department of Our Neighbors, consisting of six or seven pages, is devoted to the records of the activities of the medical

societies of other states. Our Journal is therefore giving about one quarter of its space to the record of medical society activities, thereby justifying its title as the organ of the Medical Society of the State of New York

Furthermore, the record is not merely a cuirent diary of events, but is written in an explanatory manner and edited with the same care that is given to articles in other departments

## THE FAMILY PHYSICIAN IN PREVENTIVE MEDICINE

If the present facilities of medical science were applied efficiently, a very large groupsay three-fourths-of those persons now sick would be well. Not all sickness would be prevented, for science has not yet unlocked the secrets of cancer and other conditions. The amount of sickness which is cured or prevented is further limited by two conditions,— 1. The skill of the Doctor; 2. The cooperation of the patient. Skill in the art of practice of medicine is revealed in the stage at which a disease is recognized. Tuberculosis, for example, a quarter of a century ago was usually diagnosed only in its advanced stage, when it was incurable. Today a doctor is expected to recognize it in the stage of early incipiency, and even to recognize those conditions which may lead to the development of the disease in later life. Hence there has arisen the form of practice called preventive medicine; but the principles of preventive medicine are the same as those of curative practice, and are well known to every family doctor.

Preventive medicine concerns both individuals and also citizens as a group or community. Every municipality is concerned with public conditions which have a direct effect on health;—water supplies, for example. No family physician, advising his patients, can protect the people from typhoid fever when the public water supply is polluted. Hence there arises the practice of public health, or the adoption of measures in which action must be taken by groups of people in distinction from individuals.

The practice of public health, like the ordinary forms of the practice of medicine, requires the cooperation of two participants:

- 1. The patient is the community, the village, city, county, state or nation.
- 2. The doctor is the medical profession which is concretely represented by the county medical society.

Public health is a branch of preventive medicine and its principles are the same as those in curative medicine as practiced by the family doctor. Private practice, preventive medicine, and public health constitute a series in which each form merges imperceptibly into the other two.

So far as medical skill is concerned family doctors are already qualified to practice preventive medicine and public health. The question may therefore be asked; Why are physicians not practicing these forms of medicine with the same eagerness that they show in the practice of medicine and surgery? The answer is largely economic.

Communities as well as individuals seek medical advice in order to relieve or prevent pain, discomfort or disability. An individual is ready to consult a doctor for immediate relief; and a community in a panic is willing to pay for immediate relief from a diphtheria epidemic. The doctor can earn a living by giving ordinary forms of relief for fully developed conditions; but at the present time he cannot earn a living by practicing preventive medicine or public health unless he is hired by an organization. The family doctor is compelled to practice those forms of medicine which will give him a living income. Moreover, he becomes discouraged when his well meant efforts of advice to the public are received with indifference or scorn, as was usually the case a decade or two ago. It is but natural that the family doctor should lack interest in the practice of preventive medicine and public health. Who then shall give these forms of medical service? Groups and organizations of public spirited citizens have studied the question for a quarter of a century and have developed standard forms of procedure for both the physician and the community. They have made experiments and have conducted demonstrations along every conceivable line. They have hired physicians to engage in the newer forms of practice and have gone so far as to propose state medical service for all relief conditions. They have also conducted campaigns of education among the people and instructed the people regarding their duty in accepting the medical service which is offered to them. Two conclusions have been reached by both the health organizations and physicians.

- 1. The family doctor or physician is the most practical source of medical service in preventive medicine and public health in a community. The threat of state medicine is dead and buried, and practically every health organization looks to the local doctors to give the service that is promoted by the organizations.
- 2. The peculiar field of health organizations is to educate the people along medical lines,—to inspire them to look to the family doctor for advice in community health, as well as in the sickness of individuals. Lay organizations have done their work so efficiently that the people are beginning to seek the advice of doctors along public health lines. There is a demand, for example, for efficiency in the departments of health, in pre-natal and child welfare work, school children inspection, and the correction of defects. All these forms of medical service belong to the family doctors

and a community expects the work to be done scientifically and efficiently.

The Committee on Public Relations of the Medical Society of the State of New York is promoting the practice of preventive medicine and public health by members of the county medical societies. This practically means the cooperation of the medical societies with lay health organizations. And this is what the name, public relations, implies. Physicians cannot carry on preventive medicine and public health without the assistance and cooperation of other health organizations, both lay and official. The physicians of a county cannot hold themselves aloof from other organizations: for each group is incomplete without the other. The two are mutually complementary. Both physicians and lay health workers are well organized in every county in New York State. The physicians have their county medical societies, while the lay health workers have their tuberculosis associations, parentteachers organizations, public health nursing

societies, and other groups organized to do special kinds of public health work.

The first step in securing the cooperation of physicians with the other groups of health workers is that of surveying the field in each county along two lines: 1. The work done by medical organizations, such as county societies, hospitals and tuberculosis sanatoriums, and departments of health. 2 The activities of other public health agencies.

These surveys wherever they have been made have been revelations to those who have made them. When a committee of a county society compares the health service given in its county, with similar service in counties in which it is done efficiently, there always follows a desire to improve the service. On the other hand, when a county society does not make a survey, its members are likely to think that they are already doing all that can be accomplished or needs to be done; but the known survey leads to the adoption of working standards equivalent to those of counties in which perfect health service is given

## LOOKING BACKWARD

#### THIS JOURNAL TWENTY-FIVE YEARS AGO

Incorporating the A.M.A.:—The first article in this Journal of February 1905 is a copy of a bill which reads as follows:

"A bill to incorporate the American Medical Association; Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled that, Robert · M. O'Reilly, Doctor of Medicine, Washington, District of Columbia; ...., J. A. Wyeth, Doctor of Medicine, New York, New York; .... ..... (Representatives of 34 states) and

their successors, and those who may be associated with them, are hereby made and constituted a body politic and corporate with the name American Medical Association, with perpetual succession and power to take, for the purposes of its incorporation, by device, bequest, grant, gift, purchase, or otherwise and hold or convey, both real and personal property and transact business anywhere within the United States.

Sec. 2. That the object and purpose of such corporation shall be to promote the science and art of medicine and the public health throughout the United States.

Sec. 3. That such corporation shall have

power to make by-laws rules, and regulations, and choose officers for its government and the attainment of its purposes."

The Journal also prints a letter from Dr.

Joseph D. Bryant, in which he says:

"The membership of the A.M.A., now already quite large, is rapidly increasing, because of a keen appreciation of the policy of its thoroughgoing organization, stimulated by patriotic desire on the part of the members of the medical profession to assume the responsibilities that properly belong, as good citizens, to their lot in the conduct of human affairs.

The contributing to the sanitary welfare of the country, by means of careful and scientific surveillance and by directing influences in all public matters relating to the domains of medical thought and activity, is the plain duty of medical men, whose compliance therewith each citizen should demand and no physician should refuse. The mutual recognition on the part of all concerned of the great gain that would follow hearty reciprocal action in all such matters, will enhance immeasurably business stability and professional station."

## MEDICAL PROGRESS

Treatment of Puerperal Eclampsia with Thyroxin .- Prof. H. Küstner of the Leipzig University Gynecological Clinic, reviews the familiar use of thyroxin in therapeutics, which of course conveys no suggestion of its utilization in the obstetric clinic. However it has been shown by animal experiment not only to stimulate basal metabolism but to increase diuresis. For a long period the author has been giving the drug a trial in puerperal convulsions and sees some promise in it, although chiefly in post partum cases in which spontaneous improvement may be encountered. Recently he had two particularly severe cases which developed in the seventh month. For certain reasons he did not wish to terminate gestation by premature delivery or cesarean section. Both women had many convulsions in the clinic and presented also somnolence, edema, oliguria, and moderately high blood pressure. Albumin and casts were also present. Intramuscular injections of thyroxin were given at intervals, but not until the end of eight hours were the convulsions brought to a stop after first becoming weaker and less frequent. At the same time diuresis steadily increased and at last consciousness returned. In one patient the albumin cleared up save for a trace, but labor set in prematurely with birth of a dead fetus, and the placenta showed many infarcts. In the second case labor was induced prematurely with the same result. In a third patient with a blood pressure of 270 thyroxin also gave relief. The author learned that even with intramuscular injections thyroxin does not produce its action on the kidneys until the expiration of 8 to 10 hours. Hence we must stop the convulsions with more promptly acting remedies, such as morphine. He uses insulin after convulsions have ceased, but is not certain of its efficacy.—Klinische Wochenschrift, January 4, 1930.

Toxic Collapse and Its Treatment.—E. Holzbach of the gynecological department of the City Hospital, Mannheim, has studied this subject for the past 15 years. He refers to a condition common in infectious diseases, peritonitis. etc., which he thinks is wrongly understood and unscientifically treated. The assumption is usually that cardiac failure is present and requires remedies thought suitable for this condition, although, even if these drugs prove to be of value, their remedial action is not on the heart proper but on the peripheral circulation. The blood in these cases accumulates in the splanchnic vessels and the heart has an insufficient amount of blood to propel, which makes it unscientific to intensify

its action. Digitalis is contraindicated although the author combines a little strophanthin with remedies directed against the peripheral vascular system, which is actually reached through the centers in the bulb. Caffeine he gives for the reason that, while held to stimulate the heart, it also acts directly on the vascular and respiratory centers in the medulla and on the capillary circulation. Strychnine is also theoretically indicated and recommended highly by Eppinger. The balance of the article deals with the action of adrenalin, hypophysin, and ephetonin. author is lukewarm as to the utility of the first two, but ephetonin, as shown by personal experiments of the author, is far more efficacious. In fact he appears to take great credit to himself for introducing this drug into the treatment of toxic collapse. From both the theoretical and clinical angles it shows itself as of decided value, and the end is not in sight for study of this drug in this connection will doubtless lead in time to other remedies which act on the peripheral vascular system.—Münchener medizinische Wochenschrift, January 3, 1930.

A Note on the Treatment of Vincent's Angina.—During the past nine years Philip Frank has employed a plan in the treatment of Vincent's infection in 37 cases in private practice and in about an equal number of dispensary patients, which has given uniformly rapid and unfailing results. Bearing in mind that this disease entity is caused by two organisms in symbiosis, the fusiform bacillus and the Vincent spirillum, and that each is susceptible to different agents, the procedure is as follows: After removing the membranous coating from the diseased area in early cases, or the caseous, necrotic debris in advanced cases, the raw surface is swabbed with ordinary tincture of iodine (directed against the fusiform bacillus) followed by thorough swabbing with Fowler's solution (directed against the spirillum). It is unnecessary to employ strong arsenical solutions, such as salvarsan, against the spirillum for it succumbs readily to a weak arsenical application. In addition, Fowler's solution is administered internally, 10 drops three times a day, for five or six days. In no instance has it been necessary to make more than three or four applications, once each day, to obtain a complete disappearance of the organisms and a cure of the lesion .- The Laryngoscope, December, 1929, xxxix, 12.

Dithioglycolate of Calcium in the Treatment of Tuberculosis.—Prof. H. Handovsky of the

Pharmacological Institute of Göttlingen publishes the results of some of his own experiments in this field which convince him that the subject is not vet to be dismissed. He has been feeding guinea pigs with dithioglycolate of calcium with the aim of increasing their resistance to tubercle bacilli. The calcium component has no influence in the matter and any increase in resistance must be credited to the sulphur. This negative influence of calcium is due purely, however, to the small amount ingested. The animals were adult males fed on a suitable diet and a large number of controls were used. Of 35 animals exposed to bacillary inoculation 26 succumbed within a year, half with proved tuberculosis. Of 34 treated with the salt 4 died within the year but none with tuberculosis; while the 30 survivors were in apparent health, and 12 which were killed and subjected to autopsy showed no evidence of the disease. The author therefore has no doubt that dithioglycolic acid is able to confer immunity of a sort on at least one species of animal which is very susceptible to tuberculosis. He does not state the theoretical grounds which led him to select this substance for experiment but intimates that on some future occasion he will supply such omissions in a more extensive paper.—Münchener medizinische Wachenschrift, December 20, 1929.

Tuberculosis of the Trachea.—A. Minkovsky states that tuberculosis of the trachea has been considered a comparatively rare affection. Estimations of its incidence vary greatly, ranging from 3.6 to 25.2 per cent. in the postmortem examination of tuberculous subjects. From the materials collected during the period from January, 1925, to January, 1929, at the Metchnikoff Hospital in Leningrad 2,584 corpses had organs affected by tuberculosis. Analysis of the findings in these shows that the trachea was affected in 11.48 per cent, of the autopsies. Tuberculosis of the larynx concurrently with that of the trachea occurs most often in cases of pulmonary tuberculosis with preëminently productive changes and cavitation. Affection of the larynx occurred in 19 per cent. of the total autopsies; in 10 per cent, the larynx alone was affected, while in 8.48 per cent, both the larynx and trachea were involved. That the trachea is not more frequently affected is because the organ is generally capable of offering fairly energetic resistance to injurious agents. Occasionally there has been noted a destruction of the ciliated epithelium of the trachea, which has been replaced by stratified, flattened epithelium. This may constitute one of the compensating factors in the struggle for preserving the integrity of the deeper seated tissues. An independent infection of the trachea may be explained by the enfeebled constitution of the subject, leading to a lethal issue before tuberculosis of the larynx has had time to develop. The writer distinguishes two types of tracheal tuberculosisthe preëminently ulcerated and the preëminently tubercular, but emphasizes that pure forms are not as a rule encountered. He fails to corroborate a predominating localization of the affection on the posterior walls of the trachea, as urged by some authors. The most severe forms have been seen in the lower part of the trachea. Infection may occur by contact and through the blood and lymph vessels. In all cases of pulmonary tuberculosis the physician should watch for a possible tracheal infection and should detect it before subjective symptoms of the condition appear.—
Laryngoscope, December, 1929, xxxix, 12.

Reduction of Blood Sugar by Ichthyol .-Professor E. Schmitz of Breslau refers to the active hunt for substances which can duplicate the action of insulin on blood sugar. Some of this effort is in the direction of building new synthetic drugs, while at the other extremity is the testing of long known drugs for new properties. Sulphur waters once enjoyed some reputation as an antidiabetic and several investigators have sought for a sulphurated substance which would part readily with its sulphur in the blood stream. Recently Földes tested the element in the form of a 33 per cent, solution of ichthyol. The author was at the time working independently along the same line. Many experiments have been made on laboratory animals intended to supply a proper approach to its use in human diabetes. It was found possible by securing an optimum dose of preparations of ordinary ammonium sulphichthyolate and the corresponding sodium salt to effect a marked reduction of blood sugar in the rabbit, both in the natural state of the animal and when the blood sugar had been increased by feeding glucose. mode of action is still obscure for the drug may interfere with the normal action of adrenalin or with the elimination of the sugar by the kidneys. One observer believes that sulphur exerts a direct action on the pancreas. Experiments show that when the pancreas has ceased to function ichthyol can rouse it again. It is singular to note that with the great abundance of clinical diabetic material available not a single test on the human subject is mentioned, the aim of the research being evidently the elaboration of a sound rational basis for such use. Numerous points still remain to be decided. In the clinic ichthyol has a notably favorable action on many dermatoses and the opinion has been ventured that this action is due to influence on the intermediate carbohydrate metabolism .- Klinische Wochenschrift, December 17, 1929.

The Etiology and Prophylaxis of Post-Anesthetic Sickness.—J. Ross Mackenzie states that there are four outstanding predisposing factors to post-anesthetic sickness—the psychic element in the patient, the preoperative preparation, the

anesthetic agent and its administration, and surgical trauma. He shows that processes of nerve excitement and exhaustion, begun in the preanesthetic period, may continue in the subconscious and unconscious mind throughout surgical anesthesia, and cause profound disturbance to convalescence. Hence the surgical patient should come under the supervision of the anesthetist at the earliest possible moment after reaching the hospital. The anesthetist should make every etfort to allay the patient's anxiety and apprehension. Purgatives and enemata should be given only by the express instructions of the surgeon. Starvation should mean the loss of only one meal before operation. It is important to maintain a high glycogen content of the liver and muscles. To this end food rich in carbohydrates should be taken until within a few hours of the operation, and after the operation should be given in the form of orange juice, sweetened water or tea, or glucose with pancreatin. Stomach lavage before and after the anesthetic is a procedure which has considerable merit, and deserves to be more Intravenous hypertonic extensively practised. saline solution has been used after critical operations, in many cases with brilliant results. It is a mistake to give alkaline fluids, as they hinder the metabolism of carbohydrates. The anesthetic agent is, at most, only an isolated factor in the production of post-anesthetic sickness. The ideal in anesthesia is not how deep with safety to the patient, but how light with efficiency to the sur-Anoxemia should be avoided throughout the operation by supplying oxygen, and de-etherization practised by hyperventilation with carbon dioxide. The patient should be assured of a restful night before operation by means of a nonopiate hypnotic. Blomfield recommends glucose 1 ounce, aspirin 20 grains, bromide of potassium 1 drachm, in half a pint of water per rectum as soon as the patient returns to bed. This Mackenzie has found very valuable.-The Lancet, December 21, 1929, ccxvii, 5547.

Certain Modern Procedures in the Treatment of Gonorrhea.-Prof. W. Frei of Breslau refers first to the intravenous injection of gonococcus vaccine which combines a specific principle with a fever-producing substance. this treatment the patients appear to develop a resistance to the pyretogenous substance. sees in this phenomenon the cooperation of a specific and a non-specific principle. The subject of fever treatment will be taken up later. He next discusses the parenteral treatment of gonorrhea which is used especially for complications. Apparently he uses the term parenteral in a more generic sense than some authors, for he enumerates the intravenous injection of trypaflavin and of gonococcus vaccine under this head. The results thus far are inconclusive, but the author appears to believe that recrudescences of the

disease may be prevented by this means. The success of the fever treatment of paresis has prompted the author to test it in obstinate relapsing gonorrhea. Others in this field have tested inoculation of malarial blood, but the author prefers the substitution of blood from mice with relapsing fever, caused by inoculation with the Dutton spirochete. The author treated in this way 14 gonorrheal patients with an obstinate type of disease and up to the present time 13 of these have been free from relapse—a result too pointed to be set down to coincidence. These patients, however, also received the usual local treatment. —Deutsche medizinische Wochenschrift, December 13, 1929.

Total Alymphocytosis.—Drs. L. R. Grote and B. Fischer-Wasels refer to cases of total inability of the organism to produce lymphocytes. Relative poverty of the latter is often encountered but not much is known of the total form. A case is given of a man aged 39, of good stock and never ill, who had recently taken out insurance. He was attacked by diarrhea without apparent cause, with pain in the abdomen and some vomiting, and later suffered similar attacks which succeeded one another at very brief intervals. During an attack a temperature of 102.2°F was found. He entered a sanatorium where his stools were found to be fatty. A diagnosis was impossible and the condition proved refractory to all treatment. Early blood counts were normal. As a last diagnostic resort laparotomy revealed hepatic cirrhosis, and omentopexy was performed. The patient finally entered the Von Noorden Clinic, Frankfurt-am-Main in an extremely emaciated condition, with rapid pulse, a blood pressure of 80, and localized edema. He was first placed on a salt-poor diet. The stools were always full of fat. Blood counts showed a leucocytosis of 16,000 with but 3 per cent. of lymphocytes, which soon sank to zero. The red cell count and hemoglobin were normal. diagnosis had been atrophy of the pancreas, cirrhosis of the liver, and chronic enteritis. Death took place after the development of hydrothorax and autopsy showed anasarca, ascites, hydrothorax, atrophy of the lymphatic structures, edema of the lungs, brown atrophy of the heart, atrophy of bone marrow, scars of jejunal ulcers, fatty atrophy of the liver and marked atrophy of the spleen and pancreas. The diagnosis could be summed up as atrophy of the reticulo-endothelial system which may have originated as a result of jejunal stenosis due to the contraction of several large scars of ulcers. Characteristic was the disappearance of the lymphocytes in blood which was in most other respects normal. The formation of the stenoses was responsible for the early attacks of colic.-Münchener medizinische Wochenschrift, December 6, 1929.

sent out a questionnaire to a number of his obstetrical colleagues to obtain corroboration or the reverse of his own favorable results which were 98 26 per cent positive in 459 women tested A very few positive results have been obtained in the non gravid In response to the questionnaire Prof Schmidt of Dusseldorf tested 171 gravidæ with 100 per cent positive results, while in 68 non-gravidæ all tests were negative Pankow of Freiburg obtained 100 per cent positive in late pregnancy Martius of Gottingen reported nearly 100 per cent positives in gravidæ and negatives in non-gravidæ Kehrer of Marburg is particular to give the duration of the pregnancy. In 65 patients most of whom were not later than the 7th to the 9th week he obtained but one complete failure which he could not explain away ous other reports were equally favorable although the material tested was not very large forms of pathological pregnancy have been tested, as tubal pregnancy, dead fetus, molar pregnancy, etc, but the trustworthiness in these cases is not yet established owing to scantiness of material A like uncertainty attaches to the diagnosis of very early pregnancy. In making the tests it was necessary as a rule that a strong presumption of pregnancy exist as a result of the usual routine The hormonal test does not seem to have revealed pregnancy at a very early date in the absence of other criteria. The urine of the gravida is injected into a sexually immature mouse, five or six of which must be used for each test After four or five days the ovaries of at least one of the animals should show extravasation of blood into a follicle, or a corpus luteum result is due to the presence of a hormonal substance in the urine of the gravida -Deutsche medizinische Wochenschrift, December 20, 1929 Surgical Treatment of Conduction Deafness. -Maurice Sourdille says that hitherto there has been no medical treatment successful against chronic progressive deafness of oto-spongious In 1924 Barany and Holmgren each separately published an operative method which

The Hormonal Pregnancy Test of Aschheim

and Zondek-Professor G A Wagner has

Surgical Treatment of Conduction Deafness.—Maurice Sourdille sivs that hitherto there has been no medical treatment successful against chronic progressive deafness of oto-spongious origin. In 1924 Barany and Holmgren eich separately published an operative method which was a realization of the idea of Passow of creating a window in the external labyrinthine wall which could substitute for the obstructed foramen ovale, the obstruction coming from the ankylosed stapes. The two methods differ in their approach and in the site of the window and the results, while brilliant in the relief of deafness, are offset by numerous technical inconveniences. During the past five years the author has striven to perfect the operation while combining the best features of each operator. He follows Barany in operating in two stages and in the choice of the trephine opining—at the curl of the external semi-circular curil with exclusion from the oper-

ative field of the tympanic drum He follows Holmgren in operating under full optical con-Most of the actual technique, however, is his own. In his first stage he examines the ossicles for an anatomical diagnosis, with the view of all possible conservation and any necessary transformation in the conducting apparatus terms the first stage transmastoid attico tympan-The mastord is trephined under local anesthesia, the membrana tympani is detached for the postero-superior half of its circumference, and the conduction apparatus is resected so that the ossicles and tympanum may be examined minutely as to their mobility. As a result of this stage the tympanum is reconstituted and completely separated from the mastoid cavity by a membranous veil The second stage is performed after healing is complete-usually after several In 10 operations thus far performed the author has carried out the second stage in This is known as acoustic trepanathree only tion of the labyrinth and the tympanic case is not opened at all -Bulletin de l'Academie de Médecine. December 17, 1929

Urticaria from Arrest of Compression -Dr L Gerson gives an account based on observation of urticarial and other eruptions which appeared in midsummer of 1926 There was a large placque of urticaria over the spine of the third lumbar vertebra which recurred every evening At a later period urticarial papules appeared regularly on going to bed, about twenty on an average, and of considerable size, with a notable tendency to recur at the same sites tionship was not apparent until after the lapse of some time when the author realized that the lessons all appeared at pressure points when the pressure was removed. Thus the original placque over the lumbar vertebra stood in direct relationship with the waist band of the trousers and the others also coincided in their appearance with the act of undressing for bed Some were in relation with the garters Others which developed on the nose were evidently due to taking off his horn-rimmed spectacles. In no instance had the pressure on the skin been noticeable, much less a source of discomfort. The author had always been free from hives and the affections some times correlated with them (asthma, etc.) There were a certain number of wandering wheals which were not directly in relation with pressure. Associated with urticaria was a certain amount of pruritus which was not directly associated with the wheals. The author makes an attempt to explain this phenomenon and terms it finally "urticaria from decompression" He neglects to state whether or not he was able to provoke wheals at will (urticaria factitia) -I e Bulletin Mi dical, December 28, 1929

## LEGAL

By LLOYD PAUL STRYKER, ESQ.
Counsel, Medical Society of the State of New York.

## THIS YEAR'S CHIROPRACTIC BILLS

On January 6th two bills (Assembly Nos. 44 and 45) were introduced into the lower house of our State Legislature. Once again the law-makers of our State are thus asked to legalize and sanction a cult of quacks, and to permit the exponents of an unfounded and exploded theory to prey upon the public health, and to menace the lives and limbs of the credulous and the unwary.

Bill No. 45, if enacted, would change Section 160, subdivision 7 of the Public Health Law (the Webb-Loomis Act) so as to read as follows:

"The practice of medicine is defined as follows: A person practices medicine within the meaning of this article, except as hereinafter stated, who holds himself out as being able to diagnose, otherwise than by locating and determining misaligned or displaced vertebrae of the human spine, treat, otherwise than by adjusting by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby, operate or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake, by any means or method, to diagnose, otherwise than by locating and determining misaligned or displaced vertebrae of the human spine, treat, otherwise than by adjusting by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby, operate or prescribe for any human disease, pain, injury, deformity or physical condition.'

The words italicized are those which the chiropractors seek to have added to this definition.

The definition of the practice of medicine, which these cultists would thus change, has been in force upon our statute books since May 13th, 1907, when it became a part of Chapter 344 of the Laws of that year. Time and again this definition has been construed and upheld by the courts. It is clear, concise and all-embracing. It covers what both the laity and doctors understand as the practice of medicine.

For the past twenty-three years, the law of our State has declared that "Any person who, not being then lawfully authorized to practice medicine within this State and so registered according to law, shall practice medicine within this State without lawful registration \* \* \* shall be guilty of a misdemeanor," It has been repeatedly held by our courts that a so-called

chiropractor, who plies his calling but who is not admitted to practice medicine, is guilty of a crime, and many such chiropractors have been prosecuted and convicted.

In the Ellis case,2 the defendant was a graduate of the Davenport University of Chiropractics. He had a sign, with regular office hours, and treated about two hundred persons for ailments of the stomach, chest or spine, as well as for nervousness, hysteria and diseases coming from pressure on the nerves. It was established by the prosecution that the defendant had examined the complaining witness, and pronounced her arch to have fallen, massaged the foot and advised a different shoe; and that on a further occasion he manipulated the patient's spine which, speaking as a "spinologist," he pronounced out of alignment in several places. He said that he could restore it, but it "probably would not stay the first time." He further gave his opinion that "the nerves leading to the ankle might be impinged so as to cut off the circulation."

The defendant was convicted of the crime of practicing medicine without a license. In its opinion the court, among other things, said:

"Appellant's office sign, his circular and professional card, as well as his own frank admissions as a witness, all show that he holds himself out as able to diagnose, treat and prescribe for pain, disease and injury. Rubbing and pressure on the human joints are old therapeutic agents. When accompanied by such attempts at diagnosis as the statement that a patient's pains in the ankle were from the spine having come out of alignment through displaced vertebrae, appellant's acts come within the statutory definition of the practice of medicine."

Under the older statutes, and especially under our Medical Practice Act, a large number of chiropractors have been rounded up and convicted of the crime of practicing medicine without a license. The funds derived from registration fees have enabled the Attorney General, who under our present statute is authorized to that purpose, to carry on these prosecutions; and although we might wish that even greater results could be obtained, under our present law much good has been done in stamping out this particular type of criminal. Thus, during the year 1929 ninety-nine prosecutions were begun against unlicensed practitioners, resulting in forty-eight

convictions with but three dismissals or acquittals, and forty-two cases still pending before a mag istrate or Court of Special Sessions Six of the defendants forfeited their bail and became fugitives from justice before trial

"In general," says Dr Rypins, "the courts have imposed substantial penitentiary sentences rather than fines, "\* \* " And still further 'Apart from the results of the criminal prosecution, the best results are indicated in the almost complete disappearance of the illegal display of the title 'Dr' \* \* \* and even those quacks and cultists who still persist in taking chances with the law rarely use the title 'Dr' Since the title 'Dr' indicates to the uninformed public the holding-out of a qualified practitioner of medicine, its discontinuince by those not so qualified is the greatest single contribution to the effectiveness of the Medical Practice Act in protecting the public from exploitation \* \* \*

"Neighboring states are so impressed with the working out of the Medical Practice Act in New York. State that they are endeavoring to imitate our legislation. There are still too many illegal practitioners of medicine in New York City. It would be oversanguine to conceive of a future in which no illegal practice existed, but all who are acquainted with the situation at first hand agree that at the present time there has been a greater elimination of illegal practitioners of medicine in New York City than anywhere else in the United States."

A consideration of these facts makes it doubly apparent why the chiropractors are now coming forward and seeking to amend the definition of the practice of medicine by eliminating from that definition the "locating and determining mis aligned or displaced vertebrae of the human spine" and the "adjusting by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby"

This manipulation of the human spine through which the chiropractor has thus thrived is (if the bill is passed) no longer to be deemed a part of the practice of medicine. The purpose of this amendment is to get around and circumvent the decisions of our courts that chiropractors, who engage in these spinal adjustments but who are not licensed to practice medicine are criminals. Thus, not only is the well considered and long-tried and tested definition of the practice of medicine to be broken down, but this destruction is to take a certain section of the criminal cultists out of the clutches of the criminal law.

This is neither the time nor the place, in view of all that has been said and proven throughout the years of discussion upon this subject, in defaul to establish that there is no scientific bases whatever for the theory that discusses can be

related to a misaligned or displaced vertebrae, or that such misaligned or displaced vertebrae can actually be replaced

Bill No 44 seeks to add a new article (48 A) to the Medical Practice Act, whereby chiro practic is to be legalized and licensed. This bill contains fifteen sections which provide for a board of chiropractic examiners, the qualifications of applicants, the examining of applicants, the issuing of licenses, the registration of practitioners, and various other provisions

The bill defines "The practice of chiropractic' as follows "A person practices chiropractic within the meaning of this act, who holds him self out as being able to locate and to adjust by hand misaligned or displaced vertebrae of the human spine, and tissues adjacent thereto, for the purpose of relieving nerve pressure caused thereby"

As previously stated, there is not and never has been any scientific basis for the assumption either that diseases can be related to displaced vertebrae, or that such vertebrae can actually be replaced

The bill contains the usual exemption clauses. It provides for the exemption of present practitioners from examination in the following cases.

- (a) Graduates of a chiropractic school having a course of three or more years of six months each, or eighteen months altogether, "who during the period of one year immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this State."
- (b) Graduates of such a school after a resident course of two or more years, or twelve months altogether, "who during the last three vears, immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this State"
- (c) Graduates of such a school after a resident course of one or more years, or not less than six months, "who during the last eight years immediately preceding and at the time of taking effect of this act, have been actually engaged in the practice of chiropractic in this State"

But, as previously pointed out, for the list twenty-three years a person who is "actually engaged in the practice of chiropractic in this State" is guilty of a crime. The bill does not frown on crime, it encourages it and commends

it The longer the criminal activity of the applicant for license the less course of study need he have pursued. A person who has been openly flaunting and violating and defying the statutes of this State, and carrying on his criminal calling for eight years may be rewarded by a license to practice provided he has had one year in a chiropractic school.

The irony of this measure lies in the last sentence of the section quoted, wherein it is provided that the applicant for license (who has been practicing chiropractic and necessarily has been flaunting the criminal statutes of this State) must produce "proof" of his good moral character, and this must be made "by the affidavit of two reputable citizens." How any reputable citizen could make an affidavit that a person, who openly and wilfully has been defying the criminal law, is "of good moral character," the bill does not explain.

The bill further provides that a person may be admitted to examination for license who has had "an education equivalent to graduation from a four year high school course registered by the regents or an education accepted by the regents as equivalent; provided such course shall have included elementary biology, elementary physics, elementary chemistry as taught in the secondary schools"; and that "he has actually taken a resident course and graduated from a chiropractic school" having a certain defined curriculum; and then there is this proviso: "Provided, however, that students who at the time this act takes effect are matriculated and in attendance at a chiropractic school approved by the board and who shall graduate therefrom, may in the discretion of the board be admitted to examination without the requirements prescribed by subdivisions three and four of this section."

The floodgates are thus opened wide. Not only are deliberate criminals to be licensed without any examination at all, but those who are now students in some chiropractic school need not even have had the preliminary education equivalent to a four year high school course.

It would seem that the Legislature, which has so often set its face against these preposterous licensing measures, should not again be troubled with the insolent demands set forth in this bill. The bill might well be entitled, "An Act to License Criminals." Not the medical profession alone, but every intelligent man or woman who believes in the conservation of the public health and who does not wish to see the ignorant become a prey to these quacks who are seeking to enrich themselves at the expense of the life or limb of their poor patients, should do all within their power to prevent the enactment of these iniquitous measures.

## CLAIMED CONTRACTION OF PNEUMONIA AFTER DELIVERY

In this case against two physicians, the patient first consulted physician A for the purpose of confinement and delivery. Arrangements were made with a private sanitarium maintained by physician B for the confinement of the patient. The patient was in due course delivered at doctor B's sanitarium by physician A, where the patient remained for a period of approximately eleven days after the delivery, and against the advice o both physician A and physician B left the sanitarium. The delivery was normal with no untoward effects, and the mother and child were in good health. Both the hospital's and physicians' bills were paid and no complaint made.

Subsequently an action was commenced against both physicians A and B charging that physician B had undertaken to furnish suitable living conveniences, proper food, proper attendance and to maintain the place where both the mother and

child were confined in the sanitarium in good condition; that due to physician B's neglect the temperature of the room was so low that the child contracted pneumonia, and that physician A was negligent in not seeing that physician B arranged to keep the room in such a condition that neither the mother nor the child would sustain any injuries. It subsequently developed that another physician was called to treat the infant who diagnosed the infant's condition as pneumonia. Since, however, the physician who was subsequently called did not treat the infant for several days after the child left the sanitarium, the plaintiff was unable to sustain his contention that the infant had pneumonia when he left the care of physician A and the sanitarium of physician B, and accordingly discontinued the action, thus terminating the proceeding in the doctors' favor without trial.

## LONDON LETTER

The toll of deaths in this country directly due to motor traffic, ever increasing and in 1928 reaching a total of over 6,000, has been the subject of much correspondence in the Press, and the Hunterian Society did well to choose as a theme for discussion "The Doctor and the Motorist." Perhaps from its very title and because the discussion was held by a Society of Medical men, the arguments advanced tended to find a solution in the assurance of medical fitness of the driver of the vehicle, It was said that it was not the expert driver. even if he drives at an excessive speed, who is involved in the great majority of accidents, but that the chief causes are inattentiveness, confusion or lack of judgment, and inexperience. The present system of allowing any one above a certain age to obtain a license to drive. on payment of a small fee, without any examination as to fitness, was generally condemned, and, although there are obvious difficulties in the way of compulsory medical examination before a license is issued, it was suggested that a voluntary test of competence might be submitted to and would soon be widely adopted if the possession of such a certificate of competence were taken into account by the Law Courts and by the insurance companies. The physical equipment of the motorist was well summed up by our speaker who quoted Kipling:-

"An even heart that seldom slows its beat, The cool head willing what the heart desires, The measuring eye that guides the hands and

feet,

The soul unbroken when the body tires."

There is a strong movement in favor of compulsory insurance against third party risks, and the matter concerns the Hospitals and medical men very closely. At present, it is rare indeed for a medical man, called to render first aid to a motor accident case, to receive any fee for his services, and Hospitals all over the country tell the same story of increasing demands on their beds to accommodate motor casualties and of a very inadequate return from these patients for the skill and expense involved in their treatment. We have no system in this country comparable to that I found in Canada, where street accidents admitted to Hospitals become a charge on the City. In this country, the Voluntary Hospitals are by custom open for the admission of "Accidents and Emergencies" at all times,

and their very title make it impossible to re-

cover expenses in the Courts. Compulsory insurance will not alter this state of things unless a law is passed giving the Voluntary Hospitals the power to recover their expenses from motor accident patients receiving compensation. Meanwhile, the Hospitals are faced with the necessity of reducing their value to the district they are primarily erected to serve by reserving beds for accidents sustained often by motorists coming from far distant cities.

Two of my friends, who happen to be temporarily on the sick list, have grumbled, very good humoredly it is true, about the early hour at which they are roused from their slumbers in the nursing home. "Why on earth," as one of them said, "should I be roused at 6 00 a m., even with a bribe of a cup of tea, when nothing seems to happen before breakfast at 8:00?" What is true of the nursing home is still more true of the Hospital, where the cleaning of the wards, the washing of the patients and other necessary duties must be started early if the patients are to be ready for the visit of the resident staff. But an effort is being made at the Middlesex Hospital to obviate this by a reorganization of duties, and it is hoped that the patients may be left undisturbed until 7.00 am, when breakfast will be served. This will involve a rather longer day or, at any rate, an earlier start, for the day nurses and the resident staff may be required to enter the wards somewhat later than at present, but the working of the system will be watched with interest by those concerned in Hospital management, and with keen sympathy by those who have suffered from the enforced application of the "early to rise"

It is pleasant to be remembered, and the arrival of many letters and cards from my friends in America with seasonable greetings has revived in my memory very happy thoughts of my all too short visit to you a year ago. I spent last Christmas at sea; this year, I am at home for a family gathering, but my thoughts will often turn to those who gave me so generous a welcome. Good King Wenceslas and the Mistletoe Bough are sounding from a very wet and misty street, and I must attune myself, according to ancient custom, to the hopeful task of searching my stocking for the gift which Santa Claus seems to orget so regularly.

II. W. Carson, F.R.C S.

# NEWS NOTES

## COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

A meeting of the Committee on Public Health and Medical Education of the Medical Society of the State of New York was held on the morning of January 18 in the Pennsylvania Hotel. There were present the Chairman, Dr. T. P. Farmer, and Doctors J. O. Polak, E. M. Stanton, W. A. Groat, and C. J. Longstreet. There were also present by invitation Doctors C. Ward Crampton, Richard Kovacs, C. H. Goodrich, and R. E. Plunkett, Director of the Division of Tuberculosis of the State Department of Health.

Dr. Plunkett spoke of the unpopularity of tuberculosis work with general practitioners. He argued that an element in the unpopularity was an inferiority complex on the part of the general practitioners. Many family doctors felt that the diagnosis of tuberculosis in its incipiency was so difficult that general practitioners would not undertake to make it but would refer their cases to clinics conducted by directors of sanitoriums and experts of the State Department of Health.

Dr. Longstreet quoted one tuberculosis expert lecturing in Broome County as saying, "An ordinary doctor cannot diagnose tuberculosis in its incipiency."

Dr. Farmer described the efforts of his Committee to give courses on tuberculosis to the medical societies of Rockland and Delaware counties in which the subjects of a course of five lectures were:

- Tuberculosis in children.
- 2. Pathology.
- Diagnosis.
- 4. Differential Diagnosis.
- The Clinic.

The Rockland County lectures were given in the summer of 1928, and were attended by from 11 to 23 physicians out of the 47 members of the County Society.

The Delaware county courses were given in the fall of 1928 and were attended by an average of 21 out of the 23 members of the County Society.

Dr. Plunkett was asked about the satisfaction expressed by doctors who took the courses, and he replied that he had gotten in touch with doctors and had received all degrees of reaction, from active cooperation to complete indifference. While the physicians praised the lecturers, they showed all degrees of response in putting to practice the principles to which they had listened. The Committee decided that a letter should be sent to every county society secretary calling attention to the

great need of more accurate diagnosis and better reporting of the cases.

Diphtheria prevention was next discussed. Dr. Alec N. Thomson, of Kings County spoke of the excellent results attained in that county by direct appeals to doctors to give toxin-antitoxin to the children of the families whom they treat. No general publicity or propaganda was undertaken by the County Society until a ground work of cooperation had been laid with individual doctors through their medical societies and publications. One item of contact with the doctors was that each doctor was given a placard to be hung in his office urging his patients to accept toxinantitoxin immunizations. The leaders in the other boroughs had made their appeals directly to the people from the outset of the campaign without first getting the cooperation of the doctors. The result has been that 55% of the administrations of toxin-antitoxin in Greater New York were accredited to Brooklyn which has only 38% of the population. As a further evidence of the value of direct appeals to doctors their own publications, Dr. Thompson said that a great increase in the number of applicants for public health supplies always followed an appeal made in the Monthly Bulletin of the Kings County Medical Society.

Dr. Stanton referred to the excellent results in diphtheria prevention attained in Schnectady where direct appeals were first made to the family doctors rather than to the people and public clinics.

Dr. Polak called attention to the mortality accompanying child birth, and said that the reduction of the mortality depended on three procedures:

- 1. A reduction in the number of operations, many of which were unnecessary.
- A supervision of the practice of obstetrics.
   Better management of hospitals in which obstetrics are done.

Private sanitaria and nursing homes which are unsupervised are large contributors to obstetrical mortality. The death rate in the general wards of public hospitals is greater than that in the wards set aside for maternity cases, on account of the greater chance of infection in the general ward.

Dr. Stanton said that the Schenectady County Society had analyzed the caesarian operations done in the city during the last two years, and had called the attention of obstetricians to the excessive number of operations done. The obste-

tricians have replied that they were almost compelled to interfere in slow labors, for when a woman enters a hospital she expects something

unusual to be done for her
Dr Farmer said that the recent graduates were
doing obstetrics better than the older ones and
this fact was evidence of an improvement in the
quality of teaching of obstetrics in medical
schools

Dr Farmer called on the Chairman of special committees dealing with public health problems Dr C Ward Crampton described the work of the Committee on Periodic Health Examinations, and Dr Richard Kovacs, that of the committee on Physical Therapy

Dr C H Goodrich, Chairman of the Special Committee on Water Pollution described the investigations which his Committee had done

#### COMMITTEE ON PUBLIC RELATIONS

A meeting of the Committee on Public Relations of the Medical Society of the State of New York was held on the morning of Saturday, January 18, 1930, in the Pennsylvania Hotel, New York City There were present Dr James E Sadlier, Chairman, Dr W H Ross, Secretary, Dr H A Hambrook, and Dr O H W Mitchell There were also present, Dr J S Lawrence, Executive Officer and Dr Frank Overton, Executive Editor

The first subject discussed was the surveys of counties for the determination of the health services which were already being given in each Ten surveys have already been made and published, and others are in preparation bers of the committee felt that the surveys were of great value and even essential not only for the statistical information which they disclose but also because they reveal to the local physicians the medical services now given in their counties But a survey goes only as far as the history tak ing and the physical examination of a patient, there is yet to come a diagnosis and the application of treatment. The committee discussed the method of making the surveys and of developing plans for meeting the needs for the service dis cussed in each county

It was decided to stimulate local interest in the surveys by sending a monthly letter to the president, secretary, and chairman of public health and public relations committees in each county society, giving concise information of work done

and suggestions for future action

The second subject discussed was the examination of school children, especially those about to enter schools for the first time. The State Chrimian of the Health Committees of the Parent-Teachers Association had sent a communication to the State Medical Society offering the assistance of the association in the examinations of pre-school children and asking for information regarding the attitude of the State Medical Society toward the associations plan of what is called "The May Day Round Up" after a plan developed by the Congress of Parent-Teachers Associations held two years ago. The plan consists in making a physical association of accounts.

entering child on May first, which is National Child Health Day

The Chairmen of the Public Health Committees of the Women Parent-Teachers organizations belonging to the Federation of Women's Clubs, had met on December 3, 1929, and had been addressed by Doctor Sadlier One result of that meeting was the communication from Mrs Vail of Troy, State Chairman of the Pub lic Health Committees of the Parent-Teachers Associations, offering the assistance of her organizations in each local community, and asking the committee to outline a standard plan of action for both the Parent-Teachers Associations and The Parent-Teachers Associafor physicians tions are well organized in New York State, having 15 districts, and 850 local associations Last year 122 local associations had tried to carry out the May Day Round-Up As a result of last year's experience Mrs. Vail submitted four general questions to the Committee on Public Relations as follows

1 How shall we secure the examination of the children whose parents have no family physician? Shall we have them examined at the school building by the school physician at some time that is agreed upon and advertised? or can we have them examined by physicians who will volunteer their time? or can the Medical Society aid in assigning physicians to these various families?

2 When should these examinations be made? Should they be made on May first because of the publicity given that day by the Federal and State Child Welfare Organizations? or should they be made at any time during the summer before the children's entrance into school, or even after the opening of school?

3 How can the Parent-Teachers Associations aid families in securing a family physician who would make the examinations for the parents?

4 Could the Medical Society help to influence the school physician to accept the family physician's report of his examination?

The committee considered that the examination of school children was an essential part of the modical service for which physicians were obliged to protect himself by requiring a physical examination of every employee or candidate for employment, and he likewise will find it necessary to keep the records of these examinations in order to protect himself against claims that may come from employees who have left his service. It will materially increase the popularity of periodic physical examinations, but may it not work a hardship in general against the laboring man, because employers will hesitate to take into their employment men or women who cannot pass perfect physical examinations when applying for a position? Weigh this bill well in your mind and write us your opinion.

Senate Int. No. 256-Webb (concurrent Assembly Int. No. 400-Rice), is a proposed amendment to the Education Law which would permit medical schools to conduct their courses in medicine so that the amount of work now given in four years, can be given in three years. This is an effort to shorten the time that medical students must spend in preparing to practice their profession and it has received endorsement by a number of the largest medical schools in different parts of the United States. It is requested by the Council of Deans of the medical schools of this state and has received the endorsement of the Executive Committee of our Society. If you see a reason why it should not be supported, will you advise us immediately?

Senate Int. No. 341-Gates (concurrent Assembly Int. No. 424-Cornaire), is another effort to increase the number of compensable diseases. He has added, as you will observe, radium poisoning, blisters or abrasions, and bursitis or synovitis, and dermatitis or dermatosis.

Assembly Int. No. 380-Swartz, is really a companion bill to Senate Int. No. 32. This bill would make it possible for a laborer suffering from some physical condition, to release his employer from any liability for compensation for incapacitation resulting from that particular physical disability. One can readily see that if Senate Int. No. 32 were to be enacted into law, those persons who because of a physical defect were refused employment, might find it necessary, in order to support those dependent upon them, to sign such waivers as this bill describes. The wisdom and justice of such action might readily be questioned, because if the laboring man through his occupation has incurred a condition which at the time is not disabling, but may later become so, and has signed away his right to compensation for such a disability, he will have deprived his dependents of the compensation which they otherwise would have been assured, if the disability develops. Let us urge again that you give these two bills your very careful consideration.

## COMMITTEE ON PERIODIC HEALTH EXAMINATIONS

The Committee on Health Examinations, in order to proceed to serve the physicians of the state, desires more fully to know their opinions.

The program of the Committee has been announced in the Journal. Its work is already under way. Powerful organizations are falling into line, others are being interested. It seems as if there were great and helpful forces in the state, ready to aid our purpose. It also seems that the time will arrive when the medical profession in each county of the state will be called upon to make good. The public may demand health examinations of quality sooner than we expect.

The Committee would ask each county society to prepare for action. But first, we should clear decks, call the roll, and ask the following

questions:

1. Are you in favor of holding local campaigns for health examinations:

a. On May Day for children,

- b. In August and January for pre-school examinations,
- c. In November or at County Fairs for adults and families?
- 2. Are you in favor of asking for and using the co-operation of every Federal, State, County, official, semi-official organization of

- every kind in the furtherance of this movement?
- 3. Are you in favor of the establishment of a health examination clinic in the local hospital by the local physicians, under the county society?
- 4. Are you in favor or opposed to the American College of Surgeons' plans?
- 5. Will you send your name to the Committee if:
  - a. You do health examinations in private practice, consider yourself skillful, and wish to be kept in close touch with the Committee work, or
  - b. You are a student of the Health Examination or preclinical Medicine, and you wish to contribute a paper on the subject or join the research in one of its departments?

With this opportunity given to any member of the Society to voice his opinion or objection, the Committee will proceed with its work with the confidence of the full approval of the body of the membership, and the hope that this will mean the fullest devotion to the cause of efficient periodic health examinations in every section of the state.

C. WARD CRAMPTON, M.D., Chairman.

## PUBLIC RELATIONS COUNTY SURVEY No. 11-SULLIVAN

Public health work in Sullivan County is conducted largely by two organizations—the Sullivan County Health Association, and the Sullivan County Public Health Committee. The Health Association is organized under the State Charities Aid Association, and its work is similar to the Tuberculosis Association of other counties.

The Public Health Committee is an official body appointed by the Board of Supervisors under Sec. 44-a of the County Law, to manage an appropriation of \$300 made by the county for the support of public health nursing. Three physicians are members of the Public Health Committee, which works in close cooperation with the Health Association and with the Sullivan County Medical Society. The following report of the work of the Health Association and of the Public Health Committee gives an evcellent picture of the work of the two organizations.

LUTHER C. PAYNE, M.D., Secretary, Sullivan County Medical Society.

Purpose of Organization: To utilize the resources of the corporation, without profit to any of its members, in the control and prevention of the spread of tuberculosis, and in securing lawful care and treatment for those afflicted with, or threatened by, the disease.

To cooperate with the State Department of Health, the State Charities Aid Associations and other organizations concerned with tuberculosis and public health work in the State of New York.

To help coordinate and unify the various lines of work carried on by local public and private agencies that have points of contact with tuberculosis and public health problems.

To support the constituted authorities in the initiation, development, and administration of all sound policies for the public health of the community.

To keep the public informed as to the needed improvements in community health, and as to the nature, treatment, and control of tuberculosis;

To take such other steps for the accomplishment of these aims as to improve the public health as it may from time to time deem advisable.

Organization of Work: Under direction of the District Health Officer, Local Health Officers, physicians, and executives of the association, plans of procedure are formulated.

School Work: School health work has proved to be an opening wedge for further development of public health work. This work includes,—assisting physicians in physical examination, weighing, measuring and recording percentage underweight; examination of eyes (Snellins test); conferring with physician regarding home visits; follow-up of outstanding defects.

Follow-up Visits: This is an important phase of school health work. Over 20

were made regarding outstanding defects as follows:

Examination revealed a number of children with the serious handicap of defective vision. Fifty visits were made regarding this problem. In many instances the parents were not aware that defect existed. Where it was possible to check back, it was found that many have had defect corrected.

Eighty visits were made where children were found ten per cent or more underweight. A surprising number of children were found to be underweight. This problem is discussed with parents. In one school the matter was taken up with the Parent-Teachers Association, which is providing milk to all who are underweight. Plans for hot lunch were taken up with the Red Cross where fourteen children come to one rural school day after day with no lunch.

Thirty-two visits were made regarding tuber-

culosis contacts.

Forty visits were made regarding diseased and infected tonsils. The financial problem proves a handicap in many instances where an operation is recommended. This has been referred to Public Health Committees, and has also been taken up with health officers or supervisors of towns where the problem exists.

Fifteen visits were made on a diphtheria car-

rier, and two on a typhoid carrier.

Mentally Returded: Practically every school in the county has the problem of the defective or mentally retarded child. Through the cooperation of the State Department of Mental Hygiene, "Child Guidance" clinics are held once a month in the county. A child presenting a problem from an educational and social standpoint is benefitted as the result of the examination and recommendations at the clinic. Clinics are in charge of an experienced physician who is also a psychiatrist assisted by a psychologist who does the psychometric tests. Forty children were referred to this clinic.

Health Education: Health talks and assistance in organization of health clubs were carried on in all schools visited by nurse. Total number of school children brought in contact with nurse, 5,200.

Pre-School Clinics: A series of eight State Child Guidance Clinics were held throughout the county. Number examined, 180. Analysis of records show that:

Forty children were tuberculosis contacts. Seventy showed marked dental defects.

Twenty, ten percent underweight. Five with orthopedic defect.

One, hairlip age three years. Referred to State aid.

Forty per cent of babies examined presented

Total number of pre-school children under supervision, 340.

To derive full benefit from the valuable clinics will require a good deal of follow-up work.

Chest Clinics: Through the cooperation of the State Department of Health and the County Medical Society, six days of chest clinics were held where cases were examined and X-rayed.

An analysis of records show that sixty per cent of cases examined were under twenty years of age.

Total number of tuberculosis cases under supervision, 200.

Seventy-five home visits made regarding tuberculosis cases.

Many social and financial problems have been found on homes visits. The majority of cases, as statistical report shows, came from New York City. Thirty letters were sent to social agencies referring cases back to their places of residence.

Arrangements were made for the examination, at the Loomis Sanitorium, of six contacts; one case was returned to Metropolitan Hospital; one case was admitted to Ray Brook; and one case (county charge) was returned to Tuscon, Arizona.

Toxin-Antitoxin: Under the direction of the health officers in Monticello, Woodridge, Narrowsburg, Eldred, Callicoon, Lake Huntington, Roscoe and Hurleyville, toxin-antitoxin clinics were organized. The public still need to be convinced that "protection against diptheria" is necessary and will need convincing persuasion to bring out the children of pre-school age. This problem was met by public spirited women. In communities where clinics were held a house to house canvass was made. The results were most gratifying.

Dental Hygiene: In cooperation with the dis-

trict superintendents and school boards of education, assistance was given in organization and plans for a dental hygienist who is now working in many schools in the County.

Orthopedic: State orthopedic clinics were held periodically throughout the County. Clinics were in charge of an orthopedic specialist and a State nurse who does the follow-up work.

Meetings: The association held at frequent intervals "open" dinner meetings. Representative people from all parts of the County attended these meetings. Interest and enthusiastic support is demonstrated by the fact that attendance has grown from 15 to 135.

Speakers: Miss Nina V. Short, Secretary of County Health Department, State Charities Aid discussed the problem—New York City's responsibility to Sullivan County in tuberculosis cases, a resident of N. Y. City.

Dr. Iago Galston, Professor of Public Health, N. Y. U. and Fordham University, addressed large gathering at June meeting. Dr. Galston chose for his topic "General Public Health."

Mr. George Nelbach, Executive Secretary of State Charities Aid, talked at October meeting on "Trends in Tuberculosis." Mrs. M. Anderson, State Seal Sale Secretary also spoke at this meeting.

Reports: A detailed report of "What the Association is Doing" has been presented at each meeting.

Publicity: "When public health work is understood, it usually gets adequate support." The outstanding cooperation of the newspaper editors throughout the County in giving reports of work of the association front page or editorial space has done much to bring facts before the eyes of the public.

## ERIE COUNTY MEDICAL SOCIETY RADIOGRAMS

The Eric County Medical Society is sponsoring a series of radiograms broadcasted from Station WGR, on Saturday evenings from 7.45 to 8 P. M.

The program for the Spring is as follows:

Feb. 8. The Why and Wherefore of Accidents. Dr. Chas. R. Borzilleri.

Feb. 15. Accidents From the Surgeon's Viewpoint. Dr. Chas. R. Borzilleri.

Feb. 22 and Mar. 1. The Story of Anesthesia. Dr. John H. Evans.

Mar. 8 and 15. Factors of Safety in the Human Body. Dr. Henry N. Kenwell.

Mar. 22. The Feet as a Health Asset. Dr. Nelson W. Haas

Mar. 29. The Care of the Feet. Dr. Nelson W. Haas.

Apr. 5. Varicose Veins. Dr. Cyrus S. Siegfried.

Apr. 12. Nervousness. Dr. Herman F. May.

Apr. 19. Epilepsy. Dr. Herman F. May.

Apr. 26. Man, Know Thyself. Dr. W. Warren Britt

May 3. The Value of Periodic Physical Examinations. Dr. W. Warren Britt.

May 10. The American Medical Association. Dr. Harry R. Trick.

May 17. Weeds That in the Wastelands Grow. Dr. Salvatore Parlato.

May 24. Hay Fever. Dr. Salvatore Parlato.

May 31. Structure and Function of the Nose. Dr. Harold J. McDonald.

June 7. Structure and Function of the Ear. Dr. Harold J. McDonald.

June 14. Sinus Disease. Dr. Walter M. Wurtz

June 21. Diseases of the Tonsil. Dr. Louis J. Beyer.

June 28. Fourth of July Casualties. Dr. Francis E. Fronczak.

July 5. Deafness. Dr. Chester C. Cott.
July 12. Diseases of the Nose. Dr. Otto

July 12. Diseases of the Nose. Dr. Otto S. McKee.

July 19. Sunstroke. Dr. Francis E Fronczak,

#### CONFERENCE ON THE REGISTRATION OF HOSPITALS

The subject of registration and inspection of hospitals of all kinds, including nursing homes, was brought up at a meeting of the Committees on Public Relations and of Public Health and Medical Education on January eighteenth.

It was then decided to call a conference of representatives of the Departments of Health and Social Welfare of New York City and State. This conference was held on Tuesday, January 28th, in the hotel De Witt Clinton,

Albany, N. Y.

There were present from the State Medical Society:— Drs. W. H. Ross, J. E. Sadlier, T. P. Farmer, Harry Aranow and J. S. Lawrence.

From the State Department of Health: Drs. Paul B. Brooks, and E. H. Marsh.

From the Department of Social Welfare: Mr. C. E. Ford, Director of Hospitals.

From the Department of Health, New York City: Dr. Oberwager.

From the City Department of Hospitals: Miss Mary C. Tinney.

From the New York Academy of Medicine:

Dr. S. S. Goldwater.
From the State Association of Hospitals:

From the State Association of Hospitals: Mr. L. E. Birdseye.

From the New York State Health Officers' Association: Dr. A. J. Leonard, President.

Dr. Oberwager announced that New York City has the authority for licensing and visiting all hospitals whether public or private,

operating in the city.

The Committee was impressed with the adequate measures taken by the city to protect itself against abuse of hospital privilege, and then directed its attention to the measures that exist for a similar supervision in other sections of the state.

Mr. Ford distributed copies of the law under which his division operates, and also copies of the rules and regulations that they have adopted. He explained that the activities of his division are limited to supervision of hospitals

engaging in some charity work or accepting public funds, and that no other hospitals in upstate territory are subject to other supervision than that exercised by the College of Surgeons.

It was felt that the law applying to New York City would not apply to up-state conditions in every respect, for example, that particular regulation requiring every hospital and nursing home to have a resident physician.

At present the State Department of Health inspects certain kinds of hospitals, especially those taking maternity and lying-in cases, and also children's homes, but it was agreed that it would be wise to have all hospital supervision lodged with one department, preferably with that of Social Welfare.

It was agreed that the representatives of the Department of Social Welfare should prepare an amendment to the law which would invest in them the licensing and periodic inspection of all hospitals and nursing homes outside of New York City, not now under their jurisdiction.

It was further proposed that the State Medical Society and its component County Societies might aid greatly in bringing about a better condition of hospitals. It was suggested that the State Society, either through one of its existing committees or by the appointment of a special committee, promulgate a set of qualifications that should obtain with every hospital, and that these rules and regulations be transmitted to each County Society, with the suggestion that the County Society use them as a guide in classifying the hospitals within its territory. The names of such hospitals as meet these qualifications might be given to the public as approved hospitals. If such procedure became general, the conference agreed, every hospital would find it to its interest to earn the approval of the County Society in order that it might be classed with the others and receive patronage.

## **BRONX COUNTY**

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on November 20, 1929, was called to order at 9 P.M., the

President, Dr. Aranow, in the Chair.

Election of candidates being in order, it was moved and carried that the following candidates for membership be accepted: Drs. William J. Bearman, William A. Berger, Nathan W. Chaikin, Anthony J. Della Rocca, Harry Epstein, Tobias Ginsburg, Iser Halpern, William I. Jacobs, Charles S. Lobel, Vito J. Merola and A. Lester Weisberg.

Reports of Committees being in order, Dr. Magid, Chairman of the Committee on Medical Economics, submitted the Report of the Committee, urging the cooperation of the doctors.

Dr. L. A. Friedman, Chairman of the Committee on Health Examination, reported on the progress of the Campaign of the Greater New York Committee and appealed for the cooperation of the members.

Under New Business, Dr. Aranow proposed the following Amendments to the By-Laws:

Add to Section 4, beginning at nineteenth line:

"Persons interested in the science of medicine or in the service which this Society renders to the public and members of professions allied to medicine are also eligible for associate membership in this Society."

Add Section 31 (a):

"Applications for Associate Membership shall take the same course as prescribed for applications for Active Membership except that the dues accompanying the application be those of the County Society only, and as graduation from college is not required for associate membership, the data pertaining thereto may be omitted."

The above proposed Amendments will be voted upon at the December meeting.

The Scientific Program then proceeded as follows:

## Papers:

- 1. Chronic Duodenal Stasis, H. L. Bockus
- 2. Discussion of Abdominal Pain,

J. B. Carnett

3. Treatment of Pain of Abdominal Parietes,
William Bates

It was announced that Dr. Carnett is to give a demonstration of Pain of Abdominal Parietes at Morrisania Hospital on Thursday morning, November 21st, at ten o'clock.

Following the discussion on the papers, it was moved and carried that a vote of thanks be extended to the readers of the papers of the evening.

I. J. LANDSMAN, M.D., Secretary.

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on January 15, 1930, was called to order at 9 p.m., the President, Dr. Aranow, in the Chair.

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following candidates for membership: Drs. Moses Bacher, Charlotte Blum, Benjamin Feigenbaum, Jacob I. Fine, Hyman Fogelman, Meyer Friedenson, Isidor B. Goodman, Nathan Hudes, Jacob Mendelsohn, James McAteer, Herbert E. Pugsley, Carl C. Salzman and Charles L. Weisberg.

Reports of Committees being in order, Dr. Magid, Chairman of the Committee on Medical Economics, submitted a Report, which dealt with the Central Welfare Bureau, and announced that Compensation Hearings will be held on January 23rd and 24th at the rooms of the Bronx Tuberculosis and Health Committee.

The report of the Committee on Activities of the New York Academy of Medicine, issued April 24, 1929, in relation to the qualifications and standards of specialists was discussed.

The following Resolutions were introduced:

Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate and Charter Member, Joseph J. Smith, M.D.

Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr. Smith and that a minute thereof be placed on the records of the Society; and be it

Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member.

Whereas, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate and Charter Member, Edmund E. Specht, M.D.

Resolved, That the Bronx County Medical Society record the sense of its loss in the death of Dr. Specht and that a minute thereof be placed on the records of the Society; and be it

Further Resolved, That a copy of these Resolutions be transmitted to the family of our departed member.

The above Resolutions were carried by a rising vote

The Scientific Program then proceeded as follows:

Paper: The Evaluation of Electrosurgery in the Treatment of Cancer (Illustrated). George Austin Wyeth, M.D.

The paper was then discussed by Dr. Howard A. Kelly, of Baltimore, and Dr. Max Cutler, of New York.

I. J. Landsman, M.D., Secretary.

## THE DAILY PRESS

#### AN ADVERTISING JOKE

One does not usually read the advertising pages of a daily newspaper for the sake of humor and relaxation, but an advertisement in the New York Herald-Tribune of February third belongs in the joke column. However, doctors will not enjoy the joke, for scientific medicine is always serious. Neither the editor of the newspaper nor the advertiser will see humor in the advertisement, for each considers it in the light of a business announcement. The joke is on the public who bought the product last winter so extensively that still larger sales are in prospect. As a matter of fact there is neither science nor humor nor good sense in the advertisement, which reads as follows:

"VX was discovered in England at the height of a terrible wartime epidemic of influenza. With new victims round them every day, chemists in a government laboratory were completely immune to the disease. Without doubt, the vapor

from the ingredients now in VX kept them free from infection. Physicians and scientists were amazed. For here was a swift, sure relief for Highly concentrated, this new discovery was offered to the public as VX. A drop of VX on your handkerchief gives a refreshing odor that instantly relieves colds. Breathed deeply. it clears the head, banishes congestion, limits the infection. Use it in the morning. VX keeps its strength all day. At night, a drop at each end of your pillow lets you sleep and fights the irritation then. If you have a cold, use VX. See how simple, how convenient, how pleasant it is. Use it to prevent colds too. A bottle costs only a dollar and contains fifty applications, an average of only 2 cents an application. The VX essence is imported directly from England. Ask for VX in the train, white box with the green triangle, and do not accept a cheaper imitation. It is sold in all drug stores.'

#### CIGARETTE ADVERTISEMENTS

It seems strange that tobacco, or a device for its use, should find a place in the advertising columns of a medical journal, and yet it is a fact that several medical journals on our exchange list do carry advertisements of cigarettes and cigarette holders. The psychology of cigarette advertisements is the subject of the following editorial taken from the New York Times of January twenty-fifth.

"The Federal Trade Commission, striking for honesty in claims, has given national good taste a push forward. The advertising manager who conceived the large idea which the commission has buried began with an emotion. It was to prove that his client's cigarettes could go several millions higher in annual sales. The first objective was big names.' Whether they smoked

Vocos made no difference; pay them \$1,000 and let them imply that whatever quality the world admired them for had something to do with the use of that particular brand. From that beginning it was a short step to the premise that health is the foundation of success; and, on the stage, health joined to beauty. Day after day pictures and endorsements from obviously healthy and beautiful—and successful—folk linked them with 'the respondent's brand.' It was fine until envious competitors, and joshing by friends of non-smokers whose endorsements and photographs had appeared in the advertising columns. interested the Federal Trade Commission. Now the cigarettes have to fall back upon their, doubtless, excellent intrinsic merits as smoking material only."

#### CHILD PERFECTION RATING

The New York *Times* of January 27 carries an account of a score card prepared by Dr. Ruth Andrus of Teachers College, Columbia University. The description says:

"The inventory, fifteen printed pages in length, contains 1,911 questions, of which 207 are allotted to the child's emotional capacities, 525 to mental. 864 to motor or physical and 315 to social-moral.

"Instructions for using the yardstick to the child's personality are included. These involve keeping a detailed diary of the youngster's action during three given periods of one hour each, and then checking the results against a list of desirable habits and responses.

"The questions are of a general nature and award scores of one, two and three, according to degree or intensity. A typical question is whether the child sings simple tunes without help. Others

# OUR NEIGHBORS

### HEALTH EXAMINATION CAMPAIGN IN TEXAS

Our Journal of November 15, 1929, page 1424, carried a quotation from the October issue of the Texas State Journal of Medicine announcing a Periodic Health Examination campaign to be promoted by the State Medical Association of Texas. The subject is discussed extensively in the issue of the Texas Journal for November, December and January. That for November says:

"The campaign is to be initiated by county medical societies, under the direction of their district councilors, and the board of councilors as a whole, the central office serving merely as a coordinating center and as a supplementary agent. To state it another way, the county medical society organizes for the purpose of selecting speakers and placing them before the public of their respective communities, whenever and wherever possible, stressing the important subject of periodic physical examination of the apparently well, until the idea is thoroughly sold. The councilor sees to it that each county society in his district has given the matter thorough consideration and decided what, if anything, it will do about it, aiding wherever possible. Activities are reported, through the councilor, to the office of the state secretary, where the president and others concerned in the success of the campaign may get in touch with conditions throughout the state. Should it transpire that any county society is in need of a special speaker for a special occasion, it is an easy matter to apply through the councilor, to the state office, for some outside speaker of eloquence and special qualifications, and it is anticipated that there will be no difficulty in supplying any number of these where there seems to be need of them and opportunities for them. It is, indeed, a simple plan and one which will work admirably if each party will do his part. We have every assurance that the board of councilors, individually and collectively, is interested and ready to go the limit.

"The greatest opportunity we will have to present our subject will be before ready-made audiences, with ready-framed programs, which will mean that but a few minutes may be spared for this purpose. We will do well if we can secure ten minutes, for instance, of the very valuable time of one of the well-known civic clubs, such as Rotary, Kiwanis, Lions, etc., and it will not be possible, in such a brief time, to go extensively into the subject.

"Our speakers will not be receiving any pay for their services. They will be, for the most part, physicians who are well and favorably known in their respective communities. They will, as a rule, be amateur speakers and will lack that smoothness of the propagandist which so easily and quickly arouses suspicions as to motives and objectives.

"There is a natural lack of knowledge on the part of the public as to just how the physical examination may prevent disease. It is well to give, in connection with this phase of the problem, a few concrete examples, the which may be easily understood by the inquiring lay mind. Here again, we feel that we need not go into detail. Perhaps it would be wise, in this connection, to use cancer and tuberculosis as examples, in view of the fact that the public already knows much about these two diseases, and can get the idea, therefore, more readily.

"Practically every member of any county medical society is a member of some luncheon club and their membership would indicate that they are live wires and interested in the public welfare.

"There are a large number of organizations, local, state and national, which have very largely to do with the health of the public. The doctor or his family either is, or can be, connected with one or more of these, and doubtless the cooperation of all of them could easily be secured, both in the matter of offering opportunity for speeches on the subject and in promoting the campaign on their own account.

"Quite a few of the communities in the state are served by radio stations. Health programs are being broadcast over some of these already, and doubtless most of them can be interested to the extent that they will donate the time necessary to broadcast the helpful information we are prepared to give the public along this line.

"Last, but by no means least, there is the lay press. When our speakers are to address audiences, the newspapers will give notice of the fact to the extent that the announcement constitutes news.

"Any further publicity the newspapers expect somebody to pay for, and it would be a just demand on their part that this be done. The trouble is, there is nobody to do the paying, except the medical profession, and the medical profession is already contributing its full share of the expense of the movement, in taking care of the overhead, not to mention the value of the time devoted to the cause."

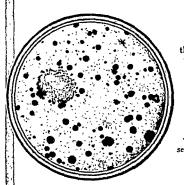

(Continued on page 244-adv. an)

very day that Dextri-Maltose is manufactured, control samples for bacteriological analyses are secured from certain points in the process which experience has shown give an accurate picture of the bacteriological condition of the product in the different steps of its manufacture. As a result of experiment and experience, it has been demonstrated that by exercising certain strict sanitary control measures and precautions, the bacteria count can be reduced to the point where the finished product approaches practical sterility. The Petri-dish at right shows a plate count of only 40 bacteria per gram, obtained from a package

# OF THE UNSEEN

The things unseen determine the cleanliness, uniformity and safety of Dextri-Maltose. From years of study and experience, we know how to produce the bacteriologically clean product indicated above.

n the other hand, the Petri-dish at the left visualizes the potential danger that may accompany lack of experience. At \$7° C., this sample (bought in the open market) showed a bacteria count of 420,000 per gram (compared with 40 per gram in Dextri-Maltose, as mentioned above). Every physician is deeply concerned about the pasteurization, certification, etc., of the cow's milk his babies are fed on, but even sterile milk would give the infant over seventeen million bacteria per daily feeding when "modified" with a carbohydrate such as is represented by the Petri-dish at the left.

# THE MEDICAL DIRECTORY

THE MEDICAL DIRECTORY OF NEW YORK, NEW JERSEY AND CONNECTICUT contains 910 pages of text relating to the individual doctors. It also has 48 pages of advertisements containing the announcements of 58 dealers and institutions on whom physicians depend for service and supplies, from abdominal supporters to X-ray apparatus. Patronize them whenever possible. They are reliable and appreciative.

### HEALTH ARTICLES WEEKLY IN WISCONSIN

The project of sending health articles to newspapers has been discussed by the officers of the Medical Society of the State of New York. The physicians of New York will therefore be interesed in the Weekly health articles which have been prepared by the State Medical Society of Wisconsin for nearly three years, and sent to over four hundred newspapers throughout the State. The January issue of the Wisconsin Medical Journal prints twenty-two letters of appreciation sent by editors, a typical one being the following from the De Pere Journal-Democrat:

"The best proof of what I think of the bulletins is the fact that these bulletins are printed regularly in our paper. I have reason to believe that the people are interested in these bulletins; and our paper, on the other hand, is more than pleased to do its share in the promotion of health and happiness among our people! Personally I believe that the bulletins should be continued along the lines which you have been following. John A. Kuypers, Editor, (President, Wisconsin Press Association.")

The same Journal reproduces a typical newspaper release as follows:

"No serum has done so much for public health

as printer's ink."

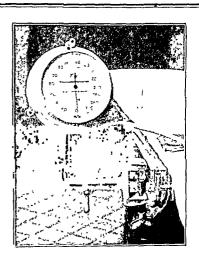

This news letter is prepared under the supervision of the Health Committee of the State Medical Society of Wisconsin. Every effort is made to have every fact tested in the light of the latest developments in scientific medicine.

"This service to the Press was endorsed by the State Board of Health, January, 1927. Released Wednesday, November 13, 1929.

Madison, Wis., Nov. 13-"Some people eat too much or too fast, causing indigestion; others eat the wrong food; and still others have some organic trouble; but the presence of distress after meals may be the opening chapter of a serious story,"-the educational committee of the State Medical Society warned in a bulletin issued today. Because indigestion is so common among people it is often disregarded. People who suffer from it should watch the foods which they are eating to discover the cause. Cutting down the amount of food often eliminates the trouble.

"The most frequent cause of indigestion is improper diet," declares the bulletin. "Either the amount of food is too large or the character of food eaten is improper, or it is eaten too rapidly. It is a wonder that the human stomach does its work at all, considering the way it is abused. You overload your stomach with all manner of improper foods, and then it balks and you call it

(Continued on page 252-adv xx)

# *Tycos* Surgical Unit

### For Blood Pressure Determination in the Operating Room

For the convenience of anaesthetists and surgeons, who are finding that accurate blood pressure readings are invaluable during anaesthesia and surgery, we have designed this Tycos Surgical Unit.

It consists of a large easy reading type ···- and a universal

the Sphygmo-

to any position convenient for the anaesthetist and out of the way of the surgeons and assistants. The adjustments can be made instantly, but once made the instrument is firm as the table itself. If it is inconvenient to have the instrument attached to the table, the clamp will accommodate it to the anaesthesia equipment or instrument stand.

Modern trends make it extremely important for hospitals to include the Tycos Surgical Unit in their operating room equipment.

Your dealer can supply you with this equip-ment. Complete unit \$52.50. Clamp only \$15.00. Write today for additional information.

indigestion. The prevention of this condition is simply the application of common sense—regular meals, proper food and not too much, and thorough mastication.

"There are many causes for indigestion other than improper diet, and it is these possible causes that make it a complaint that should be looked into. Not infrequently it is the only manifestation, to yourself at least, of chronic appendicitis; it is the early and usual advance agent of ulcer and cancer of the stomach; it is the faithful companion of gall stones. Kidney diseases are often preceded by spells of indigestion; diseases of the liver are almost constantly associated with indigestion, and it accompanies certain nervous disorders. Constipation and indigestion are 'first cousins.'

"Considering the many serious diseases, the first indication of which may be indigestion, the question may well be asked—'Why not discover these diseases when first they appear, at a time when treatment may be effective?' Why wait so long to know what the actual cause of your indigestion is, only to find that you have some organic disease that is then too far advanced to be cured. Your insurance against this possibility is an examination by your physician. If the only thing you need is correction of your diet, and you follow the advice given, you will be well repaid. If it is found that your indigestion is the beginning of some serious disease, it may be that this early knowledge will make it possible to add years to your life. If, however, you elect to guess what the trouble causing your indigestion is, and you guess diet, and you are right-you are lucky. If you guess diet, and you have the beginning of an ulcer, you have made a mistake that you must pay for. Guess work is poor policy. It pays poor dividends in both health and comfort.

"Isn't it plain that there is a cause for your indigestion? and isn't it equally plain that the proper treatment is the removal of that cause? Do not get the habit of taking drugs, no matter how harmless you may consider them. Don't get to be a 'pill swallower'. Your stomach should accommodate anything you ought to eat without being drugged after each meal with 'digestive mixtures'. Baking soda is not much good for cancer of the stomach and 'patent medicines' haven't a very high score for cures in chronic appendicitis.

"If you are having distress and indigestion after meals, and if simple regulation of your diet, such as eating regularly and cutting down on the amount of food and eating a well-balanced meal fails to effect a prompt relief, lose no time in ascertaining the real cause."

### THE UNLICENSED INSUR-ANCE COMPANY IN MISSOURI

We have called attention to the danger of taking out policies of indemnity insurance with companies not authorized to do business in New York State, and showed that the same conditions apply to the doctors of Michigan (see this Journal, November 1, 1929, page 1333).

The January issue of the Journal of the Missouri State Medical Association also warns physicians against unauthorized companies.

and says:

"Concerning the buying of insurance through companies not licensed or authorized to do business in Missouri, the insurance department says there are several important advantages in placing insurance in authorized companies only. For instance, if a loss occurs in a policy written in an authorized company and there is trouble in securing the proper settlement, the insurance department can and will intervene and assist in an equitable settlement. On the other hand, if a policy is written in an unauthorized company the insurance department has no means of helping to effect the settlement of the loss. The policyholder cannot sue in a court in Missouri, but must go into the home State of the company,-a thing impossible for the average Service cannot be obtained through the State insurance department, and if a judgment is obtained in a court of this State there is no way of enforcing the iudgment.

"It can be seen from these statements that persons buying insurance from a company licensed and authorized to do business in Missouri have a very decided protection against loss through the cooperation of the State insurance department, none of which benefits are obtainable from the department if the insurance is bought from an unauthorized company," A well known Urological Journal says:

"If you must use a diuretic, try the best —water"

This recommendation is well worthy of adoption especially if

# Poland Water

is used. ¶ Physicians have commented favorably on its bland diuretic properties for over 60 years.

# DUES IN THE LOUISIANA STATE MEDICAL SOCIETY

An announcement in the January issue of the New Orleans Medical and Surgical Journal says:

"During the past several years the work of our Committee on Public Policy and Legislation has been markedly increased, and they have found their activities considerably handicapped by the lack of suitable funds for their expenditures. The Executive Committe found it necessary last year to levy a special assessment of \$1.00 per capita to cover expenses of this committee. Only a small percentage of the members responded to this assessment.

"During the past two years the society has been planning for the edition of the history of the Louisiana State Medical Society, which is being edited by Dr. Ru-

dolph Matas.

"Your attention is called to the increased evaluation of our Journal, manifested by the additional number of original and scientific papers, increased number of pages, and other added attractions to enhance its scientific aspect. The Journal has thus . increased in size and reading matter with the distinct change in its physical appearance for the better. This required additional expenditure of money, yet our organization has not been able to increase its allotment made to our Journal for this purpose for several years.

"Various other phases of work which have been recommended have been foundinexpedientowing to the lack of finances. Constructive plans for educational purposes and other plans of instructive medical activity have had to be held in abeyance.

"At the last meeting of the House of Delegates, upon recommendation of our Retiring President, the increase of dues was manimously voted."

### CLASSIFIED **ADVERTISEMENTS**

Classified ads. are payable in advance. .To avoid delay in publishing, remit with order. Price for 40 words or less, 1 insertion, \$1.50; three cents each for additional words.

WANTED: SALARIED APPOINTMENTS EVERYWHERE for Class A Physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. AZNOE SERVICE is National, Superior. AZNOES NATIONAL PHYSICIANS' EXCHANGE, 30 North Michigan, Chicago.

FOR SALE—Active general practice, tenroom house including office suite, large lot, four-car garage. City of twenty-five thousand drawing from one hundred mile radius. Three hospitals. Owner leaving to specialize. Apply M. G. Sheldon, M.D., Olean, N. Y.

WANT TO ASSOCIATE with Practicing Physician or Institution. Am a licensed Physio-Therapist, have three years practice experience, age thirty-four and married. Have necessary equipment. References exchanged. Address: Box 126, N. Y. State Journal of Medicine.

WE HAVE an exceptional opportunity for the services of several New York registered M.D.'s to take charge of optical departments in chain department stores in various cities of New York State. Men of middle age preferred Address: "Optical," Box 1204, Providence,

### BABY GAIN

BabyGain has achieved a record of very favorable results in infant feeding and deserves consideration in every case because of its correct proportions of nutritive ingredients, easy digestibility and simplicity of preparation. It approaches breast milk as closely as is possible, both chemically and in its physical characteristics.

BabyGain is made from pure, fresh milk from Tuberculin-Tested cowsmodified and powdered.

BabyGain is sold without instructions to the mother, so that the physician may regulate its use. See page xiii. -Adv.

### THE BACTERIOLOGY OF IN-FANT DIET MATERIALS

It is not generally realized, the extent to which Mead Johnson & Company

carry their research. Efficient and systematic as are the research activities carried on for years in their own laboratories, this progressive house is constantly adding fellowships at leading universities and other institutions.

One of these has recently corroborated\* a fact of great importance to all who feed infants: No Mead Product contains hemolytic streptococci or other pathogenic bacteria.

The significance to pediatricians of this brief statement lies in the fact that the presence of hemolytic streptococcus has been suspected in infant diet products, its relationship to scarlet fever, septic sore throat, enteritis, etc.; naturally being a source of alarm.

It is reassuring to all physicians to know that not only have Mead Products never been under suspicion but that from authoritative unbiased sources comes additional proof that as a result of careful technic and long experience, Mead Products are bacteriologically clean and safe to prescribe: Dextri-Maltose, Recolac, Casec, Lactic Acid Milk, Powdered Protein Milk.

\*New York State Agricultural Experiment Station Bulletins Nos. 153 and 154.—See page xi.-Adv.

### MELLIN'S FOOD BISCUITS

Nourishment for everybody in an attractive and convenient form for all occasions and for all purposes where a light, easily digested food is desired. Afternoon Tea—Noonday Lunch— Bedtime Nourishment—At the Club— On the Links—At the Office of the Professional or Business Man or Woman-For the Athlete-For the Automobile Tourist—For the Traveller—For the Fishing or Hunting Trip—For the Camp. Send Today for a Free Sample Tin.

Mellin's Food Biscuits are put up in I Adv.

three sizes, large one dollar, medium fifty cents, small fifteen cents. If you cannot get Mellin's Food Biscuits from your dealer, send one dollar and your dealer's name to Mellin's Food Co., 177 State St., Boston, Mass., and a box of Mellin's Food Biscuits, large size, containing nineteen ounces, will be sent postage paid. See page xxv.—Adv.

### ALKA-ZANE

In a therapeutic substance it is not always practicable or even desirable to match the blood, because the blood stream is not only the food supply of the cells but also their outlet system for waste products.

Take a systemic alkalizer, for instance. It should contain neither sulphates nor lactates, as the former is a decomposition product and the other a

fatigue product in the circulation.
Alka-Zane furnishes potassium, sodium, calcium and magnesium in the form of phosphates, carbonates and nitrates. See page xvii:—Adv.

# A CLINICAL SURVEY OF THE ACTION OF THEOCALCIN

An article in the Bulletin of the School of Medicine, University of Maryland, January. 1930, by Dr. W. S. Love, Jr., describes some observations on the action of Theocalcin. Twenty-seven patients were studied to determine the effect of the drug in producing diuresis, relieving angina pectoris and reducing arterial hypertension. Fifteen cases of chronic cardiovascular disease studied for the diuretic effect, all showed marked in-crease in the amount of urine after daily doses of from 20 to 45 grams had been given for from three to seven days.

Three cases out of thirteen studied for high blood pressure showed a fall of from 50 to 70 millimeters.

Out of seven patients treated for angina pectoris, six obtained a relief varying from marked to complete.

No untoward symptoms were produced by the drug. See color insert,

### THE SAHLER SANITARIUM, KINGSTON, N. Y.

Pleasantly located in the charming city of Kingston, within easy access of New York and with all the facilities for treatment usually offered by a modern sanitarium. Average price of rooms without bath, \$35.00 a week, with bath \$55.00 a week, including ordinary medical and nursing attention. Organic and functional disorders of the nervous system and invalidism from any cause. No cases of insanity or of communicable diseases accepted. Booklet upon request. Raymond S. Crispell, M.D., Medical Director. Tel., Kingston 948.

60 Advertisers have taken space in this issue of your Journal. Give them your business when possible.

### University of Buffalo School of Medicine

Requirements for admission: Two years of college work, including twelve semester hours of chemistry, eight semester hours each of physics and biology, six semester hours of English, and a modern foreign language.

Laboratories fully equipped. Ample facilities for the personal study of cases.

Address: SECRETARY, 24 HIGH STREET, BUFFALO, N. Y.

### X-Ray Courses for Physicians-

nurses—technicians—X - Ray physics—technique—interpreta-tion. Classes now ferming. Applicants may enter first of any menth.

For information write

DR. A. S. UNGER, Director of Radiology Sydenham Hospital, 565 Manhattan Avenue, New York City

### DIGITALIS

Can an already weakened heart be improved by over-stimulation?

Recent research has served to show that digitalis does not "whip' the tired heart but "tones" it up by conserving

The J A M A, in its editorial in the issue of August 17, 1929, page 548-9, states in part Thus, digitalis reduces the energy requirement of the heart or permits it to do more work with the same expenditure of energy Only when the heart is working under the handicap of overloading does digitalis produce an increase in cardiac output"

Whether used as an emergency drug or for its systematic tonic properties, physicians realize the vital importance of an unvarying standard of potency, and hence, the persistent and increasing demand for the products of Upsher Smith

Grown on Forglove Farm, Lake Minnetonka, Minnesota, where the one crop is digitalis, the doctor knows that the entire processes of cultivation and standardization are under the personal direction of a specialist See page xv-Adv

### DIABETIC DIET READIUST-MENTS

Some foods cannot be allowed in diabetic diet at all and others only This means a readjustment by disease sparingly

in dietary habits that is difficult for the patient and trying for the physician Practically all of the restricted foods may be duplicated by using Lister's Flour Each of these starch and sugar free foods looks and tastes like the food that it replaces in the diet. With the variety of foods, possible through the use of Lister's Flour, the patient is sat isfied There is no temptation to 'cheat' and the case is better kept un der control Some of the Lister foods

Bread Biscuits, Cheese Biscuits Lunch Biscuits, Drop Cakes Cookies Spice Cake, Charlotte Russe Lady Fingers, Bread Pudding White Fingers, Bread Pudding 'White Bread, Nut Bread, Spiced Bread, Gold Cake, Pie Crust, Pie Fillings Filled Doughnuts, Meringue, Muffins etc See Front Cover -Adv

### LACTO-DEXTRIN

In an investigation of over 2,000 patients suffering from constipation and intestinal toxemia, the head of the Bat tle Creek Sanitarium laboratory found that the normal acid-forming bacteria could be restored in a satisfactory and efficient manner by the persistent use of Lactor-Dextrin (Lactose 73%—Dextrin

The extent of the change depends upon the amount taken the length of time it has been given and the degree

By exclusion of putrescent foods and the continuous use of Lacto-Dextrin in smaller quantities, an aciduric flora may be maintained after it has once been

established by Lacto Dextrin feeding In cases of obstinate constipation, quicker results may be obtained by the combined use of Lacto Dextrin with Psylla (plantago psyllium)—a plant seed which provides bulk and lubrication See page ix -Adv

### McGOVERN'S GYMNASIUM. INC

More and more physicians are realizing the futility of leaving patients to their own resources when exercises are prescribed, and have learned that through individual attention at McGovern's, their instructions will be faithfully carried out

A work out will convince you of the superiority of the McGovern Method Let us send you a guest card No obligations, of course. See page xu - !dz

### KALAK WATER

Many diseases are complicated by an 'acidosis" An important part in their treatment consists in replacing those elements needed to maintain the alkalı reserve

In clinical practice a rational and agreeable method of alkalinization is to which the intestine has been crippled afforded in Kalak Water-See page IV - 4dz

When the patient revolts \_

at the thought of taking pure cod liver oil, many physicians recommend Dewey's Emulsion of Vitaminetested cod liver oil, port wine and Irish moss.

The port wine, perfectly emulsified with pure cod liver oil, disguises the taste, breaks the oil into small molecules, and makes for easier and more complete assimilation. This combination, together with Irish moss, helps to overcome nausea and makes Dewey's Emulsion ideal for many patients who can't stand pure cod liver oil.

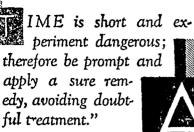

A full size bottle will be sent free upon application.

### DIET QUESTIONS have GELATINE ANSWERS

# HOW CAN A PATIENT LOSE WEIGHT WITHOUT LOSING HEALTH?

When you prescribe a weight-reducing diet—you need your patient's co-operation. And you will be sure of that co-operation if your diet satisfies the hunger for bulk and the longing for "something good".

Here's where Knox Sparkling Gelatine plays an important part in the weight-reducing regime. Being a pure, plan gelatine—it is a form of protein which may be used more freely with less danger to the kidneys than some other forms of protein.

It is free from sugar or coloring matter, and may be combined in delightful variety with foods of low calorific value—giving the necessary appetite-satisfying bulk without supplying the fat-producing calories and conforming to the fundamental principles of nutrition. In the Knox weight-reducing menu are found many salads, desserts and other dishes which are well-balanced dietetically but low in calorific value.

The physician should exercise care, however, to prescribe pure gelatine—Knox Gelatine—for most of the gelatine preparations now on the market are heavily sugared and flavored. Knox Gelatine is the real gelatine.

We shall be pleased to send you a number of dietary booklets prepared by an eminent dietitian on the subject of gelatine in foods. The coupon below describes them—please fill it out and mail it today.

## PNEUMONIA

and its treatment with

### Antipueumococcic Serum Lederle

Refined and concentrated as prepared by FELTON

### **ADVANTAGES**

### Smaller Bulk-

Average volume is about one tenth that of the original serum.

### Minimized Serum Reactions-

Serum reactions are minimized due to the elimination of inert foreign proteins.

### Standardization in Units-

This makes it possible to use the product with more certainty of adequate dosage

### Procedure

10,000 to 20,000 units should be injected at the earliest possible moment after diagnosis.

Repeat every 8 hours until the temperature falls and beneficial effects are evident. If the disease is severe and the patient very toxic, double the unit design at 4 hour intervals

Antipneumococcic Serum (Lederle) is supplied in syringes containing 10,000 and 20,000 units each of Type I and Type II.

A Treatise on Pneumonia will be sent upon request

# The Action of NEUTRALON

A synthetic aluminum silicate with about twelve per cent sodium silicate

NEUTRALON is specially indicated in the treatment of gastric and duodenal ulcer

DOSAGE: The usual dosage of Neutralon is a teaspoonful stirred in half a glass of water three times daily, before meals when the protective and astringent action is required, and after meals as an antacid.

### ORIGINAL PACKAGES:

NEUTRALON

Boxes containing 50 and 100 grams.
Belladonna-Neutralon
Boxes containing 100 grams.

### BELLADONNA-NEUTRALON

15 Neutralon with the addition of 0.6% extract of belladonna.

### Antacid

Neutralon has a twofold antacid effect, a slight immediate effect through the action of the soluble sodium silicate component and a slow prolonged effect through the decomposition of the insoluble aluminum silicate which converts free into combined acidity.

### Astringent\_

The aluminum chloride formed by the reaction of Neutralon with the acids of the stomach acts as a mild astringent, thus tending to limit gastric secretion.

### Adsorptive

Neutralon and the silicic acid adsorb albumen and pepsin so that the harmful digestive action of pepsin on the ulcerated wall of the stomach is hindered.

### Protective and Analgesic

Unchanged Neutralon and the silicic acid formed during the course of the reaction tend to form a coating on the ulcerated wall of the stomach, thereby affording protection against mechanical and chemical irritation.

# Announcement

BENDINER & SCHLESINGER desire to announce that their X-ray Staff has been augmented by the appointment of Edward E. Kaplan, M.D., former Director of the Radiological Laboratory of the Gallinger Municipal Hospital and Clinical Professor of Roentgenology in the George Washington University Medical School, both of Washington, D. C., as Director of their X-ray Laboratory.

The X-ray department is maintained for the service of physicians only and occupies the entire street floor of our new building specially erected, thus avoiding stairs or elevator, making it most convenient for your patients.

Visitors cordially welcomed. Correspondence invited.

This Laboratory is approved by the Council on Medical Education and Hospitals of the American Medical Association, also by the New York County Medical Society.

# An Effective Ally in the Treatment of Pneumonia

Anything short of major calibre in a diathermy machine for the treatment of pneumonia will prove disappointing. The Victor Vario-Frequency Diathermy, Apparatus is designed and built specifically to the requirements. It has, first, the necessary capacity to create the desired physiological effects within the heaviest part of the body; secondly, a refinement of control and selectivity unprecedented in high frequency apparatus.

In the above illustration the apparatus proper is shown mounted on a floor cabinet. from which it may be lifted and conveniently taken in your auto to the patient's home.

AREPORT from the Department of Physiotherapy of a wellknown New York hospital, dealing with diathermy in pneumonia and its sequelae, states as follows:

"As a rule diathermy is indicated in acute pneumonia, especially so when the symptoms are becoming or already are alarming: the temperature is high, the patient is delirious, the pulse is extremely rapid, cyanosis is deep, the respiration rate is high, the breathing is very shallow, and the cough remains unproductive. Not infrequently in a pneumonia case with such alarming symptoms, after a few diathermy treatments an entire change of the picture takes place: cyanosis lessens, respiration becomes deeper, the quality of pulse improves, the rate decreases, the

New York—205 E. 42nd St. Buffalo—1100 Electric Bldg. Rochester—809 Rochester Gas & Electric Bldg., 89 East Ave. Syracuse—207 University Block Albany—75 S. State St., Room 508

temperature is lowered, and the cough becomes productive. Auricular fibrillation that develops occasionally in similar pneumonias or other types of pneumonia where the toxemia is great, has been changed to a perfect normal rhythm after a few diathermy treatments."

You will value diathermy as an ally in your battles with pneumonia at this season, aside from the satisfaction derived from having utilized every proved therapeutic measure that present day medical science offers.

A reprint in full of the article above quoted, also reprints of other articles on this subject, will be sent on request.

# LIQUID PEPTONOIDS WITH CREOSOTE

Combines the active and known therapeutic qualities of creosote and guaiacol with the nutritive properties of Liquid Peptonoids and is accordingly a thoroughly dependable product of definite quantities and recognized qualities as shown by the formula:

Each tablespoonful represents

Alcohol (By Volume)						12%
Pure Beechwood Creos	OTE				•	2 min.
GUAIACOL						1 min.
PROTEINS (Peptones and F	rope	oton	es)		•	5.25%
LACTOSE AND DEXTROSE	•	•		•	•	11.3%
Cane Sugar	•	. •		•		2.5%
MINERAL CONSTITUENTS	(Ash	.)			•	0.95%

It acts as a bronchial sedative and expectorant, exhibiting a peculiar ability to relieve Bronchitis—acute or chronic. It checks as well a persistent winter cough and without harsh or untoward effect. It is agreeable to the palate and acceptable to the stomach—with merit as an intestinal antiseptic. Supplied in 12 oz. bottles.

Samples on request

### STERILITY DIAGNOSIS: THE STUDY OF SPERM CELL MIGRATION IN THE FEMALE SECRETIONS AND INTERPRETATION OF FINDINGS\*

By WILLIAM H. CARY, M.D., F.A.C.S., NEW YORK, N. Y.

7 HIS subject is brought to your attention for the following reasons:

First, I am convinced that most physicians in seeking the cause of a barren marriage either omit the post-coital examination of the male element, frequently called the Hühner test, as a substitute for the condom method of demonstrating motile spermatozoa.

Second, it is my opinion that a post-coital examination has a far greater and indeed an indispensable place as a diagnostic procedure in sterility study when conducted as a uniform biological investigation of sperm cell behavior and migration in the female secretions and the findings are interpreted with regard to the factors which govern their complementary relations.

Third, in an analysis of 200 completely studied problems it was found that the major cause of sterility was demonstrable by such a post-coital investigation in 48 per cent of the cases and that failure of spermigration\*\* was due to unfavorable conditions in the wife as frequently as to the diminished fertility of the husband.

Fourth, this diagnostic procedure is also of great value when spermigration is found in active progress, for the medical examiner may then conclude that the cause of sterility is to be found in some functional or organic disorder above the level of the internal os.

For accurate evaluation of the husband's fertility it was necessary, in many of my cases, to subject his element to at least two examinations, once when mixed with the wife's secretion and again when secured as a direct independent specimen; and the correlated findings seem to confirm that the rhythmic motion of the sperm cell, which is an expression of protoplasm energy, must be tozoa in the seminal discharge which are normally developed and exhibit an enduring motility. By these studies I have been impressed that the morphology of the spermatozoa is not only an important index of spermatogenesis (Moench1) but it bears a definite relation to the success of their migration (See Figure 2), for cells with en-

vigorous and sustained to enable the cell to com-

plete its itinerary and penetrate the ovum. The fertility of the male seems, therefore, to be a rela-

tive quality, determined by the number of sperma-

larged and irregular heads are blocked by the selective hazard of the cervical mucus. In some cases male specimens which were evaluated by direct examination as potentially fertile, but of the less vigorous type, were found by post-coital examination to be insufficiently vigorous to fertilize in a monogamous relation owing to some minor impediment in the female. Such an observation is of great importance in determining the treatment. In such instances sterility of many years' standing may be spontaneously terminated by improvement in the physical condition of one or both partners due to vacations, et cetera.

The medical director of a large laboratory, after being convinced himself, urged that it be again emphasized that an examiner's report of "motile sperm cells present," while saving a pa-tient's vanity, may grossly mislead the physician, for such a finding may be honesty recorded when the semen is highly deficient.

In order that an examiner may more accurately interpret the diagnostic significance of the macroscopical and microscopical post-coital findings, he must understand, first, the anatomical conditions in both male and female which, though not essential, are conducive to fertility; second, the physiological changes which occur in the female as a result of sexual intercourse; and, finally, the significance of these factors in favoring the reception, retention and migration of the male element (See Figure 1). The importance of these phe-

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 5, 1929.

<sup>\*\*</sup> The suthor has coined the word "spermigration" to signify the migration of spermatozoa through the cervical canal. The term "insemination" is not generally understood to include this pheno-

nomena in the process of reproduction will be briefly considered.

The anatomical factors which govern the successful retention of the seminal discharge within the vagina are, first, depth of penetration by the male organ which depends chiefly upon proper physical and psychical adjustment; second, the dilability and inclination of the vaginal canal; and, third, the effective closure of the vaginal introitus by well-developed levator muscles. When the vagina is shortened by underdevelopment, especially if associated with congenital flexion of the uterus, almost immediate loss of the semen occurs. The amount of semen retained to the time of examination is also governed by the patient's mode of travel to the office, and the expulsion of the specimen is favored by the evacuation of the bladder and bowels, coughing, sneezing and voluntary efforts to simulate an orgasm.

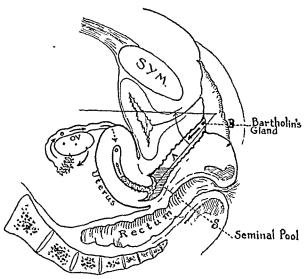

FIGURE 1

Anatomical conditions and physiological phenomena involved in insemination and spermigration are shown diagrammatically. The Line A indicates the length of the vagina and the angle of inclination. The alkaline cervical secretion increased by coitus makes direct contact with the retained semen. (See Figure 2.)

B. Bartholin's Gland S. Seminal Pool.

Other gynecological conditions with which we are concerned in a study of spermigration are the length, calibre and patulousness of the cervical canal and the amount and character of its secretion. To forestall controversy, based on individual exceptions, let us at once observe that the importance of cervical abnormalities must be interpreted in relation to the vigor of the male element and that in certain cases spermatozoa are found passing vigorously through cervices which we consider unfavorable; hence, one value of the post-coital examination. I have microscopical proof, however, of only three such cases.

Recent observations lead me to believe that in certain men, at least, not all parts of the seminal

discharge are of the same potential fertility. The first portion of the semen, which is more forcibly ejaculated, is thinner, less viscid, and contains sperm cells of greater vigor and better morphology than the semen when considered as a complete homogeneous specimen. I do not believe this observation has been previously recorded and hope that others, especially veterinary investigators, will cooperate in making further determinations. By such a hypothesis one may explain the occasional occurrence of pregnancy without rupture of the hymen and the ineffectiveness of certain contraceptive measures.

An ideal sexual relation between man and wife is frequently lacking. It should involve, at least, a normal frequency of sexual contact, a tactful and affectionate aggression by the male with such attention as may stimulate a strong desire in the normal female. Dickinson<sup>2</sup> discussed these items in a recent article and states that the brief duration of the husband's sexual cycle is a frequent cause of unsatisfactory response by his mate.

When libido is normally aroused certain changes occur in the woman similar to those in the male. These changes include erection of the clitoris, turgescence of the vagina and uterus, and a relaxation of the sphincter muscles of the vagina and rectum. Considering the action of the sympathetic nervous system, one would expect that the relaxation of the sphincters would be accompanied by spasm of the uterus, bladder and other pelvic viscera, and I have accumulated much evidence that this occurs. This phenomenon is probably reversed at the moment of orgasm. A copious evacuation of mucus by the vulvovaginal glands aids the introduction of the male part. I have found this strongly alkaline fluid is a favorable medium for the spermatozoa, and its distribution over the vaginal walls reduces the chemical antagonism of their usual secretion. The secretion of mucus by the cervical glands which is also stimulated by coitus is doubtless of much importance in the process of fecundation. As a result, the cervical canal, which is normally but a moistened channel with its walls in apposition, becomes dilated with a thin, glistening, alkaline and slightly viscid secretion. This secretion overflows from the external os into the vaginal vault where it meets the semen and is invaded by the sperm cells. In this medium the sperm cells are protected from the action of contraceptive douches. It should be noted that the above changes probably occur before the orgasm is reached and that libido, while not necessary, would seem, from our present knowledge, to be of the greater importance.

### The Post-coital Investigation

In the absence of any definite proof I have assumed that if there is any time during the inter-menstrual period more favorable than another for making a post-coital study, it should be

during the first half of this cycle, for at this time, in the majority of women, the ovum has matured and sexual desire may be somewhat increased. Whenever practicable, therefore, I make this test in the post- rather than the pre-menstrual period.

A definite appointment is made for the examination, and in arranging the time the examiner should also consider the convenience of his patient. Sufficient time should be set aside so that the hour at which intercourse occurs may not be too rigidly fixed and a delay of fifteen or twenty minutes in the patient's arrival at the office will not prove disturbing. Definite instructions should be given in a casual manner. Inhibitions are diminished and appointments are less frequently broken if the physician states that the examination involves sexual compatibility rather than individual fertility, and that failure in carrying out preparations need entail no difficulties other than a telephone report and arrangements for a later appointment.

The period of sexual rest which should precede the test should be determined by the habits of the couple. I have found it desirable to urge that there should be no departure in other respects from the usual conditions. Intercourse should occur approximately an hour before the examination. For fifteen minutes after coitus, and longer if proximity to the office permits, the wife remains in a reclining position. A sanitary napkin is then tightly applied. Preparation should be made before coitus so that the patient may avoid visiting the toilet before the examination. Other circumstances which interfere with semen retention have been enumerated. An automobile offers the best means of transit to the office. All apparatus used in examination is kept warm until the patient arrives (Fig. 3.) The time which has elapsed between coitus and the patient's arrival is noted. Experience has shown that the general statements of patients as to the unfavorable conditions under which coitus was carried out usually refer to lack of spontaneity.

For examination the patient is placed in the usual dorsal position. External evidence of semen loss should be noted. A slightly warmed bivalve speculum (without lubrication) is then adjusted in the vagina exposing the cervix and posterior sulcus, and is left in position until the conclusion of the examination.

### The Vaginal Pool

The absence of the seminal pool will be anticipated in some cases for reasons which I have previously outlined. From the statements of the patient, the condition of the external genitals and the sanitary napkin, and the number of spermatozoa found in the cervical mucus, one may deduce if the semen was completely expelled while the patient was in the recumbent position, or if the

loss occurred after she assumed the upright position. The immediate loss of semen may be reduced if the patient remains in a hip-elevated position after intercourse. A smear from the vaginal secretions may be necessary to determine if insemination actually occurred. By demonstrating the absence of spermatozoa in the vagina when semen was found externally I was led to make further inquiries which revealed failure of male

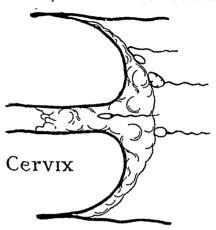

FIGURE 2

In accordance with biological law the normal cervical secretion is an ideal medium for normal sperm cell migration which is affected by their rhythmic motion under resistance. Increased resistance or weakened motion destroys this equilibrium and defeats migration. Thus weak and deformed cells are strained from the shorm stream.

penetration as a cause of sterility in six cases. The absence of a seminal pool when all conditions are favorable for its retention, and there are neither objective nor subjective evidences of definite loss, usually points to marked oligospermia—confirmation being made by direct examination of the male specimen.

When patients have complied with all instructions a definite seminal pool is normally found in the vagina, varying in amount from 15 to 40 minims. Though seemingly incredible I have record of at least two patients who, after traveling more than forty blocks by taxi, reached the office with vaginal specimens exceeding half the quantity of a normal male discharge and a satisfactory specimen was found in one patient who had ridden five niles by motorcycle. When the pool has fully formed in the dependent portion of the vagina its reaction is tested by litmus paper. In some instances where only a small amount of semen is retained the pool will be found to be

acid. Because the motility of the sperm cells is greatly impaired, if not entirely suspended, in an acid medium, one cannot fairly evaluate male fertility by the microscopical examination of such a specimen, although the number and the morphology of the sperm cells may be studied.

When the seminal pool is sufficient in amount to retain its alkalinity, one finds it usually presents, upon microscopical examination, a fair index of male fertility. Exceptions are encountered, however, when an excessive amount of vaginal secretion contaminates the seminal specimen and sperm cell activity is retarded by the vaginal debris. In these cases the fertility of the male may be definitely established when the cervical specimens are examined. A diagnosis unfavorable to the husband is not made until the vaginal findings are

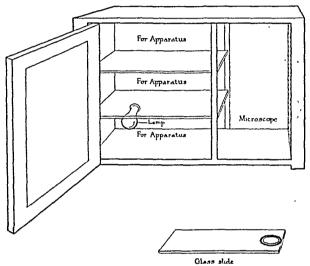

FIGURE 3

A simple cabinet in which the apparatus used and the specimens secured in the post-coital investigation are kept warm. It contains a microscope, 12 pipettes, 12 cervical cannulas, glass slides (with labels) and cover glasses, test tubes, minim graduate, thermometer and litmus paper.

confirmed by direct specimen study. When the reaction and microscopical findings have been noted a portion of the vaginal pool is placed in the warm box for later observations. The seminal discharge is then sponged from the vagina and the examination of the cervix is begun.

### The Cervix Study

The transparent, glistening mucus found in the canal of the normal cervix should be increased in amount and diminished in viscosity after coitus. Evidence of cervix stimulation is not commonly found in the infantile or hypoplastic cervix nor does it occur if the endocervix is chronically infected. The thick, tenacious, muco-purulent discharge characteristic of the severe types of endocervicitis and its destructive action upon the male element is so generally recognized as to need no

further comment, but the post-coital examination has shown that the milder degrees of endocervicitis which often escape casual inspection may also prevent conception. Simple, passive congestion of the uterus is characterized by hypersecretion of the cervix. The canal is sometimes dilated and the cervix may become succulent and eroded. Clear mucus is found within the canal. A considerable quantity of cervical mucus may be found in the seminal pool when these patients are examined after coitus, but this condition is not as apt to block spermigration as the accumulation of highly viscid secretion which is sometimes found in a poorly drained cervix.

The pipettes used for securing specimens of cervical mucus should be well-made and equipped with a strong rubber bulb. The first specimen for microscopical study is taken from the mucus which has escaped from the canal and is spread over the vaginal surface of the cervix. A small portion of this mucus from the region of the external os is engaged in the tip of the pipette and the specimen lifted. Whatever amount of mucus is thus obtained is gently spread on the slide and immediately protected with a cover glass. If this external mucus is too tenacious to be easily secured the pipette should be abandoned at once and the special glass cervical cannula (Fig. 4) which I have devised and which may be attached to any Luer syringe is used. Repeated efforts to engage the mucus in a pipette or forceful efforts to expel it, destroy its value as a microscopic specimen. If it is known that the mucus has been in contact with a vigorous seminal pool and the invading sperm cells are found to be inactive or sluggishly motile the unfavorable character of the mucus is demonstrated. If on the contrary a large number of well-developed spermatozoa are found traveling vigorously in this mucus the male specimen may be considered satisfactory regardless of vaginal pool findings. This slide is then labeled and put aside. After the vaginal surface of the cervix is freed from secretion the tip of the cannula is introduced a short distance within the external os and a specimen from the first portion of the cervical canal is obtained. I do not wish to imply that one can entirely control the amount of mucus secured. The greatest care is exercised, however, and whatever specimen is first obtained is used for the microscopical study. (It is my practice, when possible, to study the character of the cervical secretion at the examination preceding the post-coital study.) time the transparency and viscosity of the speci-men may again be studied (Fig. 5). If, with proper equipment, difficulty is found in obtaining the specimen or in expelling it from the cannula, it usually indicates that the viscosity of the cervical mucus is increased to an obstruction degree.

Under normal conditions many fast-traveling spermatozoa are found in all parts of this first

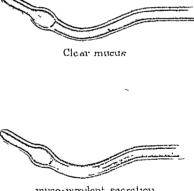

FIGURE 4 A consula which is attached to a Luer syringe and used for withdrawing mucus from the cervical canal.

intracervical specimen. The examiner invariably finds, however, that many of the sperm cells have ceased their activity at this point in their itinerary. When migration of the sperm cells is found to be greatly impaired or to have stopped in this specimen, one may usually determine, by correlating the findings already made, whether this failure is due to reduced male vigor or increased mucus resistance. In occasional instances both factors are involved. Continuance of the rhythmic motion of the sperm cells without progress usually indicates abnormal viscosity of the medium Based upon the results of treatment as well as investigation the writer has found that abnormalities in cervical secretion, due to stenosis or passive congestion, constituted the major cause of sterility in 10 per cent of the cases If mucus remains in the first portion of the canal after this specimen is taken, this excess is removed with a second cannula. Gauze wipes are rarely necessary, except in obviously obstructive conditions. If spermigration is active in this first specimen, the aim is now to trace this migration to the internal os. I attempt to accomplish this by emptying the canal of its secretion. A clean cannula is used for each manipulation (from 3 to 5 being required) as one climbs the canal. The quantity of the specimens obtained varies for obvious reasons but, whatever the amount, all of each specimen is placed on a separate slide, immediately covered and the slides progressively numbered The tip of the cannula is an inch within the canal when the bulge is at the external os. In taking the highest specimens it is important that suction be slowly started and as soon as resistance is encountered the suction is not increased but held steadily at this negative level as the cannula is withdrawn. In this way one may be reasonably sure that the mucus came from the point at which the tip of the cannula stood when suction was begun. I am aware of no other technical tricks save gentleness Proper equipment, patience and time are essential in this work.

### Normal Cervical Findmas

When the post-coital findings are normal the nucroscope will reveal the active migration of sperm cells in all of the cervical canal specimens and this activity continues several hours. Specimens from the upper canal will not differ materially from each other, but they vary markedly from the first cervical specimen which, because of its position and sieve-like action (Illustration 2), contains, as earlier noted, many abnormal,

muco-purulent secretion

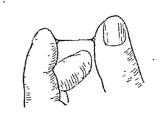

FIGURE 5 Simple methods of testing the transferency and viscosity of mucus.

sluggish and inactive spermatozoa. In the higher specimens the number of sperm cells is greatly reduced-from three to ten being found in the highpower field. Careful examination reveals that these cells have exceptionally long tails and that the heads are well-developed, sharply-outlined, and translucent. Their speed varies considerably, the progress of a cell being occasionally resumed after a moment's inactivity. While studying such specimen under a high magnification, I have seen a spermatozoon collide with a foreign body and hesitate for several seconds while the head, pointing itself by an ameboid fovement, struck repeatedly in a serpentine manner at the obstructing organism. Observations lead one to believe that the lavish production of sperm cells anticipates a tremendous mortality and that relatively few spermatozoa have the energy to complete their migration. The blockade of the sperm cells may be affected abruptly or gradually. A promising start does not necessarily insure the completion of the cervical itinerary; hence, the value of the higher specimen study. The gradual reduction and final disappearance of the sperm cells as we study succeeding specimens is the most convincing observation. The interpretation of border-line findings is often difficult and sometimes impossible. Second investigations are frequently necessary. When only the cervical part of the examination is to be repeated a satisfactory investigation may be made some hours after intercourse. Preparation for the patient may, therefore, be simplified, coitus being allowed at any favorable morning hour, and a prolonged rest in bed increases the opportunity for spermigration.

### Difficulty of Securing Cervical Specimens

Conditions are not uncommonly met which make it impossible to carry out the technical details of the post-coital investigation as herein described. Frequently the difficulties encountered will indirectly disclose the major condition involved in the sterility problem. Microscopic traces of blood may be ignored but when oozing develops the examination must be terminated. If bleeding follows the introduction of a properly made cannula one should suspect the presence of some obstructive lesion within the canal, such as a polyp or an inflammatory stricture. If the external os is known to be punctiform or stenosed

a large hypodermic needle should be ready and substituted for the cannula. By patient effort, however, the cannula can usually be passed. This is impossible, however, when much of the cervical canal has been stenosed and distorted by traumatism. Stenosis may cause changes in the viscosity of the mucus sufficient to bar fecundation. There are cases in which the normally patulous cervical canal is constantly occupied by a mucoid secretion so dense and tenacious as to resist removal, or if secured the specimen is liberated as a long, elastic, ropy mass. While the usual technic cannot be carried out under these conditions an absolute blockade to sperm entrance is definitely established. The cause of increased viscosity in these cases is not clear but as it is also frequently noted in the cervix during pregnancy and the puerperium I assume it is associated with congestion. Finally, there are a few cases in which the cervical canal is small in calibre, its walls apposed and the secretion so scant and tenacious that a satisfactory specimen cannot be obtained. This condition is usually found in the long hypoplastic cervix, and if the vagina is also underdeveloped the seminal pool is immediately lost. A group of conditions exist, therefore, which are unfavorable to spermigration. These cases have been studied with considerable interest. Frigidity is a frequent complaint and after intercourse the cervix is found absolutely unchanged and uninvaded by sperma-

In making these studies one is frequently discouraged by the difficulty of the problem. Endowed research laboratories would find this true in studying questions which pertain to human sexual relations. For obvious reasons, observations made in private practice can rarely be demonstrated to others, although research workers among our patients have been encouraging critics.

Two hundred and sixty-six detailed post-coital investigations with correlated data provide the material for this presentation, I feel that this type of investigation is an essential if not the most important single diagnostic procedure in the study of sterility.

# THE MEDICAL PHASE OF THE WORKMEN'S COMPENSATION LAW\* By JOSEPH S. LAWRENCE, M.D., EXECUTIVE OFFICER MEDICAL SOCIETY OF THE STATE OF NEW YORK

HE operation of the Workmen's Compensation Law in New York State requires the distribution of about \$28,000,000 annually, of which \$20,000,000 is required

for payment of compensation and \$8,000,000 for medical and surgical fees. These figures help to give one an idea of the rapid development in the care of injured and physically incapacitated employees the state has made. We are all more or less familiar with the

<sup>&</sup>lt;sup>1</sup> Moench, G. L., "A Report on Sperm Examination made in Obscure Cases of Sterility," Med. J. & Rec., July 20, 1927.

<sup>2</sup> Dickinson, R. L. "Premarital Examinations as Routine Preventive Gynecology," Amer. J. Obst. & Gyn. Nov. 1928.

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 5, 1929.

evolution of the Workmen's Compensation Law and recall that when it was first enacted, it had few friends and many critics. The employer had never considered the injured employee as a responsibility of his and felt it an imposition that he should be asked to provide medical or surgical care for those injured in his service, and discovering that he could share the responsibility with the insurance company, he promptly did so. He readily authorized the treatment of an employee injured in his service by any surgeon or physician that the employee might select. Free choice of physician or surgeon in those days was the rule, but a number of factors and conditions soon developed which brought about a limitation of choice. The first of these probably was the objection of certain physicians and surgeons to some unpleasant phases of the work. They did not care to have workmen in their greasy clothing and shop atmosphere, come directly to their crowded offices. They could not, nor would they, attempt to hold themselves available for calls at any time during the working hours of industry. Another group simply had no interest in industrial work and chose not to develop such interest. The workman was not always aware of what physicians belonged to these two groups and frequently was obliged to make several calls before he secured the services he sought. Delays of this kind were considered more or less serious by the insurance companies, and to prevent their repetition, they were prompted to make a list of physicians who would be available to the injured employee.

Other physicians lost interest in industrial work because of the arduous paper work it entails. They had limited office force and could not undertake to supply the many reports that the law required, and after having repeatedly failed in getting compensation for their services because of their failure to file the required reports, they declined the work.

The insurance companies, under the law, have no authority to make selection of physician, but they can bring pressure to bear upon the employer whose insurance they carry. If he has many accidents or authorizes medical care unsatisfactory to them, they can refuse to carry his insurance unless he limits his authorizations to those physicians and surgeons who have their confidence, on the ground that his business is too expensive for them to carry.

With these factors working, one can readily appreciate how the present status has developed, and one cannot help but wonder whether conditions would remain different for any length of time if the entire past could be for-

gotten and a free choice of physician again permitted.

Reference has been made to objection on the part of certain physicians to the arduous paper work involved The law requires-and it is not an unreasonable demand-that the physician to whom an injured employee comes, shall make immediately a report of his findings, diagnosis and temporary prognosis; that this report should be filed promptly with the insurance company, that it may be aware of the fact that a liability has been placed against it and that it may take such steps as are necessary to inform itself of the probable extent of the liability. It is also required, and reasonably, that the physician should from time to time inform the carrier, his employer, of the progress of the case and file, at the close of the case, a complete statement of services and the date of discharge. If a physician has only a few cases, filing these reports may not be any particular burden, but when he has many patients and the great majority of them are discharged after two or three visits to the office, one can see how difficult he finds it to comply with the requirements of the law without the help of rather adequate office assistance. It appears that the proper filing of accurate reports has caused more difficulty for physicians who would undertake industrial work, than all other factors combined. One can hardly see how this difficulty can be overcome or reduced, except by physicians taking the pains to inform themselves thoroughly and accurately as to the manner of preparing and filing the reports required.

Accuracy and promptness in preparation and filing of reports cannot be over-emphasized. Physicians have a reputation for tardiness in submitting bills, which they should not be proud of and which may have been appreciated past times, but today society requires promptness. The law permits the physician twenty days in which to file his first report, which should be ample time. The facts in the report should be so clearly stated as to leave no doubt as to their accuracy. A physician who regularly describes conditions so as to create the impression that the patient will be incapacitated for a month, and then discharges him in a week, may think that he is demonstrating great ability, but the insurance company soon discovers the inaccuracy and makes its own deductions. Not only does such a physician's reputation suffer because of his fault, but to a degree he has done an injury to the character of all physicians.

Lifting cases indiscriminately by the insurance company is a practice against which physicians most rightfully object. When a physician has been authorized by an employer to treat a case and, for no reason which he can appreciate, the insurance company orders the patient to report to another physician for treatment, he justly feels that he has been treated unfairly. Insurance companies admit that they do order patients from the services of one physician to another, but claim that they never do so except in the interest of the patient. They state that some physicians realize that certain cases are beyond their experience and might fare better in the hands of another physician, and make no objection to transference under such conditions. We can readily appreciate this, but the transference of a patient from one physician to another because the first physician was not one of the insurance company's selection, we believe is bad practice and will not necessarily be in the interests of the patient. Lifting may readily become a vicious practice. Inspectors can form acquaintances and friendships with certain physicians and permit the influence of those friendships to prejudice them in their supervisory capacity. No one can deny that the insurance company, because of its liability for the charges incurred, should be interested in seeing that the patient receives the most effective treatment available, but an inspector, who may have no medical training, should not have absolute power over the welfare of the injured. On the other hand, instances have come to light where inspectors have refused to transfer cases, although requested by the physicians who have them in charge; for instance, a physician has a patient with tuberculosis of the spine, following trauma. This patient should be transferred to a tuberculosis hospital, but the inspector refuses to authorize the transfer, prefering to accept the diagnosis of trauma rather than tuberculosis. There can be no question as to whether the patient is receiving the best care in this instance.

For a medical system to be ideal, industry must have available at every hour in which the plant is in operation, medical service at a moment's notice. An injured employee should be cared for immediately; he cannot be expected to go a long distance from the plant seeking medical attention, nor to sit in the doctor's office a half hour or more awaiting his turn. If the injury is of such nature that the physician must visit the plant, it should be possible for him to respond immediately that he is called. These conditions are patent to all and have presented the strongest incentive for the creation and operation of industrial service systems. New York City has, at the present time, probably more than one hundred such systems, one of them with eighteen or twenty stations and more than a score of physicians and nurses employed on full or

part time. From this they range in size to one that may have but two stations, operated by one physician and nurse. In a recent conference, representatives of insurance companies stated that the industrial service systems were not ideal and for many reasons they preferred the services of the individual physician, but they admitted the advantages of a system that had a methodical way of preparing and submitting records. The most objectionable feature of these industrial service systems is their manner of securing business. They advertise themselves through placards posted in the industries in their immediate vicinity, and some have unwisely created the impression by the use of their placards, that they have the endorsement of the State Department of Labor. A properly conducted service might readily be likened to a form of group practice, and when conducted by physicians with a proper regard for ethics, can be of great service.

Another advantage the chain dressing system has, is that of transferring treatment from one station to another; for example, if a man resides far from the plant in which he was injured, he can be treated at the station near his home, although the first treatment was made at the station near the plant. Serious charges have been placed against some of the systems for carelessness in handling patients and unjustifiably prolonging treatment. It is very evident that if the systems are to continue, some authoritative body must be given power of supervision and some regulations regarding their conduct must be formulated.

One more source of annovance to the general practitioner, arising in his practice of industrial medicine, needs mention, and that is the habit that insurance companies have of reducing bills. Their defense is that physicians purposely charge them more than they would an individual for similar services. This comes about through a knowledge of the physician's custom of charging a patient in proportion to his income; and the insurance company thinks that, although it is obliged by law and has contracted to pay the fees incurred by the patient, nevertheless the physician should make the fees porportionate to the wages of the man. The insurance companies have little upon which to base an argument of this kind and there is abundant evidence to show that they have been working an injustice upon the people in general by the practice; for instance, workmen are admitted to many hospital wards at the rates of city patients, which everybody knows are but charity rates and entail a deficit to the hospital. Society has no obligation to the insurance company which would warrant its meeting in part its liability. Some hospitals, however,

have always maintained that industrial patients are not the wards of the city or community, but of the insurance company and, therefore, the insurance company must pay the regular hospital rate and not the charity rate. It seems to the writer that their decision is correct and should prevail in every hospital, and physicians, likewise, in their private practice, should make a fair charge for services rendered in compensation work. However, no defense can be offered for the indiscretion of certain physicians, and quite likely all of us have knowledge of some instances of the character where physicians have deliberately overcharged for their services, because the work was to be done for an impersonal insurance company. Whether bill cutting preceded bill padding, is as difficult to determine as the old question of the hen and the egg, but justice should prevail and men should refrain from increasing their charges because they expect them to be reduced, and, likewise, insurance companies should be willing to pay physicians for services rendered, the regular fees they are accustomed to charge.

Many of the vexing problems which beset the practitioner as he enters the field of industrial medicine, could be alleviated, if not entirely eliminated, if a better understanding existed between physicians, insurance companies and employers, with regard to the problems involved. This has been proven to the satisfaction of those who have attended the conference arranged by Commissioner Perkins between the Industrial Council and representatives of Medical Societies and hospitals. There seems to be unanimous agreement by those who have been studying the problem that it is as essential that the State Department of Labor should have the services of a Medical Advisory Council as it is to have the services of a council composed of representatives of employers and insurance carriers. A bill authorizing the creation of such Advisory Council was prepared by the Industrial Survey Commission and introduced in the legislature the last two years, but failed of enactment because of technicalities connected with its introduction. There is little doubt but that such law will be enacted in the very near future. The powers of the Medical Advisory Council, as recommended by the Industrial Survey Commission, should be: (a) To consider all matters connected with the practice of medicine submitted to it by the Industrial Commissioner, the Board, or the Industrial Council, and to advise them with respect thereto; (b) On its own initiative to recommend to the Council such changes of administration or procedure as may be deemed important and necessary from the medical viewpoint; (c) To consider the qualifications of persons being considered for positions in the Department, involving the practice of medicine, and to advise the Commissioner regarding their fitness for appointment.

The Council should have power to confer not only with the medical division of the Department of Labor, but also with the Division of Industrial Hygiene on questions of sanitation. Without doubt, in time this Council could prove itself one of the most valuable additions to the Department of Labor.

The relationship that should exist between physician and industry should approximate that established between physician and individual patient. The objective is the same-the physician's sole interest is in restoring the injured to health, regardless of who pays the bills, and probably his relationship with the individual might be improved in these modern times if he submitted to all of his patients statements for his services more promptly, in cases of short duration, and at frequent intervals in cases of long standing. Laymen who have not required medical service for years, are inclined to speak slightingly of physicians' services, and when suddenly called upon to employ a physician, have been overwhelmed by what they consider exorbitant charges. A certain amount of this might be obviated if the physician took more pains to keep the patient or those interested in the patient's welfare, informed of the nature and extent of treatment rendered, and if the physician, likewise, was more particular about the manner in which he distributes his charity. Every physician is ready and willing to render services for charity when called upon to do so, but in the eyes of many administrators and economists, it is a mistake for the physician to render free services to wards of the state or institutions fully qualified to meet their expenses. The public expects the physician to be paid for his services, except where he chooses to bestow them without charge, and this relalationship should prevail between the physician and industry; between the physician and the state.

Obviously, a system so radical as the workmen's compensation was when inaugurated, requires some years of experimenting before it will work harmoniously. Such has been the case, and now we can expect better times. It is said that medical fees are increasing, but that the loss of time per injury is growing less. Without doubt, these trends indicate better medical care. There is ample opportunity for practice for every physician who wishes to share in industrial work, but on entering it he should thoroughly inform himself of the requirements of the law.

## HYPERTHROPIC PYLORIC STENOSIS IN COLORED INFANTS

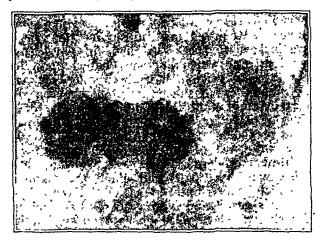

By MORRIS GLEICH, M.D., AND SAMUEL GOODMAN, M.D., NEW YORK, N. Y. From the Pediatric Department of Harlem Hospital

A SEARCH through the literature has revealed the fact that Hypertrophic Pyloric Stenosis is rare in colored infants. For this reason we report the following cases:

Case 1.—G. P.—A colored infant, delivered normally, weighing seven pounds at birth, had been breast fed for three weeks. She ate well, gained ten ounces in this period, and had soft yellow stools.

At the age of one month she began to vomit, lost nine ounces in a week and was constipated. The vomiting was projectile in character.

On admission she weighed seven pounds eleven ounces. Study revealed visible gastric peristalsis, a palpable tumor mass in the pyloric region, projectile vomiting, dehydration, loss of weight, gas-

G. P. Fed a milk-barium mixture and x-Ray taken at once (Immediate).

tric retention and constipation. After four hours x-ray showed that no barium had passed through the pyloris. (See plate.)

In view of a loss of nine ounces in one week and the poor condition of the child medical care was foregone and surgical intervention resorted to at once. Operation by Dr. John F. Connors disclosed a markedly contracted and thickened mass throughout the entire length of the pyloris. It felt like gristle to the knife and we could hear the grating sound. The Fredet-Ramstedt operation was done.

The post-operative period was uneventful with the exception of a few days of vomiting. This was controlled by gastric lavage. Breast milk was fed throughout but hypodermoclyses of 5% glucose were given for ten days.

At the end of ten days the child was retaining one to one and one-half ounces of breast milk

every two hours. Hypodermoclyses were discontinued. After a month the child retained three ounces of breast milk every three hours and was put back to the breast. The infant was discharged at the end of fifty-two days weighing six pounds five ounces and in good condition.

Case 2.—A female colored infant who was a low forceps delivery, weighed six pounds two ounces at birth. She was breast fed for seventeen days. When six days old the infant had lost fifteen ounces and a complementary feeding of a powdered milk was given. From the sixth to the seventeenth day there was a gain of nine ounces. There was no vomiting and the general condition was fair.

Vomiting began on the seventeenth day of life and persisted in spite of all measures. In five

G. P. Four hours later, x-Ray shows gastric retention.
Little barium has passed through the Pylorus.

days there was a loss of twelve ounces. The child was dehydrated and its condition poor.

The infant was seen by us at the age of twenty-two days. Visible gastric peristalsis was noted but no pyloric tumor was palpable. Constipation, projectile vomiting and marked dehydration were quite evident. X-Ray showed no barium passing through the pyloris after five hours. (See plate).

Operation (Dr. John F. Connor's Service) revealed a thickened pyloric ring about one-half inch long and rather hard. A Pyloroplasty was done.

The post-operative care was interesting. Unable to obtain breast milk after five days, Lactic Acid Milk was used. The infant took from one to three ounces every three hours, had soft yellow stools, did not vomit but failed to gain. We resorted to thick cereal feeding with better results. After fifteen days on thick cereal we changed to Lactic Acid Milk again. The infant took it well

A milk-barum mixture ingested by infant and X-ray taken at once (Immediate).

now and thrived This was continued for two and one-half months, when the baby was sent home.

At operation the infant's weight was five pounds five ounces, and at the end of three

Case 2

Five hours later most of the barum is still retained in the stomach (Infant had not been fed for five hours)

months when discharged, it weighed ten pounds two ounces. It's appetite was good. It took five ounces every four hours. There was no vomiting and its stools were soft and yellow.

## THE ADVANTAGE OF A COMPLETE DIAGNOSIS IN CARDIAC CONDITIONS\* By ROBERT H. HALSEY, M.D., NEW YORK, N. Y.

N early times such terms as disease or fever were accepted, as a sufficient diagnosis of the kind of illness. Today it is common habit to state the cause of the fever; as typhoid or pneumonia. More recently yet, the anatomical diagnosis of a broncho-or lobarpneumonia is refined by stating the type, as I, II, III or IV. With more accurate and wilespread knowledge the satisfactory diagnosis of disease requires consideration of minute details to describe the causal agent and effect on the body. These details are of such great importance because they influence matters of public health, determine therapy affecting the individual and indicate the objectives toward which the skill and knowledge of the physician is directed.

For one phase of the study of heart disease by the Heart Committee appointed by this Society questionnaires were sent to the hospitals of the State requesting the etiology of the disease of the heart of patients dying of heart disease. Of the 30,131 heart deaths in the State only the astonishing small number of 2,004 or 66 per cent could be grouped under the simple etiologic factors.

Rheumatic Syphilis Other forms .	. 4%	217 81 1706
•	100%	2004

The conclusion seemed to be justified that hospital historics of patients dying of heart disease did not contain the statement of etiology, hence the record room could not file or cross index the case under headings of etiology

Etiology was reported on only 66 per cent of the whole number of deaths. It is amazing that the significance of this very small number is not recognized by the physicians of the State The teachers of medicine do not realize that few of the students in the medical schools, or serving hospital internships, think of the importance of etiology. The absence of etiology from the recorded diagnosis occurs in hospitals famed for sympathetic skill and in those reputed for teaching and knowledge, as well as in hospitals of lesser distinction

A study was recently made of the clinical and pathologic diagnosis of a small random chance sample from several New York City hospitals of patients dying with heart involvement and coming to necropsy. On the average

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York at Utica, N. Y., June 6, 1929

sixty per cent of the clinical diagnoses did not mention etiology and thirty per cent of the pathologic diagnoses did not mention etiology.

The survey of death certificates on file in the Bureau of Vital Statistics show as causes of death catalogues of names of valvular damage, lining and muscle inflammation, but rarely anything of the etiologic factor. An oft recurring group of terms appearing on certificates reads as follows—cause of death:

Primary

Pericarditis

Endo-and Myo-carditis

Mitral and aortic stenosis and regurgitation Valvular disease

Secondary

Angina pectoris

Cardiac hyperthrophy and dilatation

Fatty degeneration

These might very well be re-arranged to show etiology, anatomic and physiologic defects as follows:

Primary

Etiologic Active or ina

Active or inactive rheumatic

heart disease

Anatomic

Pericarditis—acute: serous

: serofibrinous

Chronic cardiac valvular disease Mitral and aortic stenosis Mitral and aortic insufficiency Physiologic Mitral and aortic incompetency

Secondary Etiologic

Arterio-sclerosis

Anatomic Hypertrophy and dilatation of

heart

Arterio-sclerosis coronary artery

Fatty degeneration

Physiologic Anginal syndrome

The review of these diagnoses recalls the finding, as published in the Report of the Heart Committee, Table IA that in 1926 the profession of this State assigned 48.6 per cent of the deaths to chronic myocarditis, while in 1922 only 34.1 per cent were so assigned. And in 1926 only 15.7 per cent of the deaths were credited to valvular heart disease, but in 1922, 23 per cent had been so assigned. There was no great change in the etiologic factors of heart diseases in this period of five years, yet there was this definite change in the point of view of the physicians of the State. The valve damage appeared to them to be less important than the muscle damage, in accounting for death.

If now the method of grouping is assumed to depend upon the probable etiological factor, the groups might be made as follows: assume that the damage to hearts before forty to be due to the virus of rheumatism; some of the hearts diseased about forty to be due to syph-

ilis, and most of the damage after forty to be due to arterio-sclerosis or senescent changes. There will be some cases of syphilis of the cardiovascular system before forty and some cases due to rheumatism after forty, but the actual numbers in the whole group are small and possibly nearly equal. These assumptions then have a small error of inclusion or exclusion, but because of the nature of the case, as indicated above, will, to some degree, counterbalance each other. Rearranging the figures of the groups on these assumptions will give the following:

Chronic Myocarditis—Under 40, rheumatic; over 40, senescent.

Chronic Endocarditis—Under 40, rheumatic; over 40, senescent.

Valvular Diseases—Under 40, rheumatic; over 40, senescent.

Mitral Regurgitation—Under 40, rheumatic; over 40, senescent.

Mitral Stenosis-All ages, rheumatic.

Cardiac Insufficiency—Under 40, rheumatic; over 40, senescent.

Diseases of the Aorta—Under 60, syphilitic; over 60, senescent.

Cardiac Hyper-trophy and Dilitation. Under 40, rheumatic; over 40, senescent.

Cardiorenal Diseases—all ages, senescent. Other Diseases of the Heart—Under 40, rheumatic; over 40, senescent.

The deaths have been rearranged in this way and the result is summarized in Table II. Rheumatism would account for over six percent, Syphilis for about one per cent, and Arterio-sclerosis for ninety-three per cent of the group. This relation would nearly agree with the age incidence at death; for, about ninety per cent of all the deaths from Heart Disease occur after 45 years.

In a recent Bulletin of the American Medical Association (1929—XXIV p. 101) there are recorded eleven, so-called "circulatory" diagnoses occurring in the private practice of one physician as follows:

### Circulatory

Circulatory
Aneurysm 2
Angina pectoris
Aortitis, 1
Arterio-sclerosis
Cardio-renal 3
Endocarditis 58
Decompensation
Hypertension 3
Myocarditis 44
Pericarditis 2
Ruptured aorta 1
Total

If these diagnoses were grouped under the term cardiovascular would it not help our consideration of the possible etiologic agents?

If the probable causal agents are considered would not the pathology be clearer if arranged in some such manner as follows:

Rheumatic heart disease Pericarditis	2 8
(	60
Syphilis	1
Aortitis	7
Aneurysm	4
Ruptured aorta	Ţ
•	_
	4
Arterio-sclerosis	
Arterio-sclerosis	30
Angina pectoris	18
Myocarditis	
Hypertension	3
Cardio-renal	3
•	_
(	28

The 14 Decompensation may be placed in whole or in part, in rheumatic, syphilitic, or arterio-sclerotic since the term tells nothing as to the causal agent but only states failure of function. It is very probable some of the fourteen should be allocated to each of the three groups.

It may be said then that a review of diagnoses as recorded in private practice, hospital practice and on death certificates reveals rarely a statement of the probable etiologic factor causing the heart damage. Yet it is upon the conception of the scope of the diagnosis that treatment of the patient with a damaged heart is founded.

The defects of the heart that the physician is called upon to remedy are three and may be grouped as follows: the disease or etiologic factor; the structural or pathologic damage produced by the causal agent; the disordered function of the heart resulting from the structural damage.

The causal agent may be inferred from a careful consideration of the anamnesis in which is included; conditions of the environment; the family history as indicative of hereditary factors or direct transmission of infective agents; the experiences of the individual including exposure to infective diseases or emotional and psychic insults; the sensations of the individual and the relation of symptoms to conditions of activity or rest; the patient himself with statement of time, manner and effect of changed physical ability.

The structural damage or pathologic diag-

nosis may be inferred from the duration of and the type of etiologic factor considered to be active and from the observation of abnormal physical conditions and functions shown by symptoms during life. These inferences and deductions require experience and skillful examinations—physical and clinical. No physical examination should be considered satisfactory without the assistance of the roentgen ray and often, too, only after the use of instruments of precision.

The enumeration of the methods of obtaining information presents a formidable array of procedures yet their execution does not exceed the possible ability of the average physician.

The outlook for the patient will depend upon the knowledge or estimate of the activity of the causal factor, recognition of the structural damage already done and whether the damage may be increased before therapy can achieve a cessation or complete abatement of the activity of the destructive agent.

The physician must consider the relation of the varied etiology of heart disease to the community health, the possibility of transmitting the infection to others and the necessity of circumscribing the activities of the infected person. He must consider, the relief of the incidental symptoms and complaints of the individual but devise methods of terminating the activity of the causal agent and the restoration of the functional efficiency of the damaged organ.

The titles of the International List of the Causes of Death do not yet give consideration

to etiology, but the Bureau of Vital Statistics of the New York State Department of Health can and will cooperate and tabulate the etiology, if the physicians of this Society and State will state the etiology in the certificates. In its report, your Committee made recommendations for improvement in completing certificates by using an accepted nomenclature. If the physicians of this State, which has the greatest number of deaths of any state, one in every five deaths is caused by heart disease, will think and write in terms of etiology, the records will become at once of first importance in clarifying the heart problem. As yet there is no way anywhere of analyzing the problem on a large scale, but the physicians of this State can do it and thereby lead in elucidation, as they have lead in the study of the problem.

To summarize: the physician who considers etiology is prepared to treat the heart patient intelligently: the patient advised from the point of view of etiology will be better advised how to avoid damage to the heart and how best to conserve the heart when damaged. The inclusion of etiology on certificates of death will make possible the analysis of heart deaths by etiologic groups. Such analysis will make possible the invention and application of effective preventive measures.

The diagnosis of heart defects to be complete must contain the statement of etiology, anatomic damage and physiologic efficiency.

A complete diagnosis of heart conditions is advantageous to the patient, to the physician. and to the community.

### NEW FORM OF BIRTH AND DEATH CERTIFICATES

By J. V. DE PORTE, Ph.D., ALBANY, N. Y. From the Division of Vital Statistics, New York State Department of Health.

Beginning January, 1930, new forms of birth and death certificates will be put into use in the State, exclusive of New York City. The

main change in the birth certificate is an elaboration of the items relating to the occupation of the father and mother. These items

(14-17, 23-26) have been adopted by practically all states in the Registration Area. They are identical in wording with the corresponding sections of the schedule to be used in the coning federal census, so that the returns of birth may be classified on a comparable basis with the corresponding groupings in the census.

¥	14 Trade, profession, or particular kind of work done, as Epinner, sawyer, bookkeeper, etc.	
UPATI	king of work done, as spinner, awyer, bookkeeper, etc.  15 Industry or business in which work was done, as slik mill, sawmill, bank, etc.  16 Date (month and year) last engaged in this work	•
000	16 Date (month and year) last engaged in this work	17 Total time (years) spent in this work

From the Birth Certificate

In the new form of death certificates, the physician is interested in the medical part Compared with the old certificate, a great deal more space has been provided for answers to the various items in this section

Item 25 calls for the "cause of death" and the "contributory causes" The cause of death does not mean the mode of dying, such as heart failure, asphyxia, or asthenia. The cause of death means the disease or injury which causes death. If the death was due to disease, the physician is to state as the "cause of death" the disease, either present at the time of death or of recent occurrence, which initiated the train of events leading to death or was directly the cause of it. For instance, in a case of measles followed by bronchopneumonia, measles is the "cause of death" and bronchopenumonia is the "contributory cause".

If death was due to violence, the physician shall state whether it was accidental, homicidal, or suicidal, and also give the means and nature of the injury. For instance, a statement of the cause of death as merely "poisoning" would not be acceptable unless it was also stated that the poisoning was accidental suicidal, or homicidal. In this particular instance the kind of poison if known, should be mentioned, as for example, strychinine, arsenic, etc.

If there were no contributory causes, an explicit statement of a single cause would be entirely acceptable, for example, "cancer of the liver," "chronic interstitral nephritis," "accidental burns, conflagration"

The column on the right, calling for the "duration of condition" should be answered exactly, or approximately if no exact information is available. For example, if the cause of death were a chronic disease, such as pul monary tuberculosis, it would be impossible for the physician to state the duration correctly to a day, he should be able, however, to state the duration in years and, perhapmonths. In many other conditions, the duration could be given accurrately in months or days.

Item 26 asks "where was disease contracted or injury sustained." It is, of course, fre quently impossible for the physician to deter nine where a disease was contracted. In such an instance an answer 'unknown' is entirely acceptable, but this information is of such importance that an effort should be made to determine it.

Item 28, which asks "what laboratory test assisted diagnosis" may be answered by describing the test in brief form as microscopic, serological, bacteriological, chemical, etc. The term 'laboratory' does not necessarily mean a public laboratory, if a test is made by the physician in his own office, a statement of the test should be given

The reverse of the certificate lists, among other things, a number of "undersirable" terms which the physician should avoid in his statement of the cause of death. Every year the State Department of Health is obliged to make almost ten thousand inquires regarding indefinite statements of causes of death. If the physician would attempt in each case to give a definite statement of the cause of death, this work could be reduced considerably to the satisfaction of the Department and the medical profession.

# PERIODIC HEALTH EXAMINATIONS FROM THE STANDPOINT OF THE OTORHINOLARYNGOLOGIST\*

By ROBERT C. HOWARD, M.D., F.A.C.S., NEW YORK, N. Y.

THE problem of the periodic health examination from the standpoint of the nose, throat and ear specialist is essentially: to recognize abnormalities or disease present in the upper air passages, and if possible, afford relief or amelioration of the condition: to find potential sources of trouble, and remove them, if possible, or reduce this possibility to a minimum: to teach people how to live; that is, how to work, rest, dress, bathe, play etc.; so that, they may get most out of life, live longest, with the least morbidity possible, and to have in mind the aim, to superimpose the ancient Greek ideal of "a beautiful mind in a beautiful body" upon that of Locke, namely, "a sound mind in a sound body." These two conceptions are not incompatible, but are synergistic, and should be kept constantly in mind.

The examination should begin with the taking of a careful history, and with such relevant facts in mind as were elicited by the cross examination, we should proceed to a thorough physical inspection and examination of the nose, throat, larynx, ear and allied structures, and especially of the paranasal sinuses and of the lymphoid tissues of Waldeyer's ring for evidence of infections in those frequent sites of trouble; in fact, if we include the teeth, we have the three most important sites of focal infections—with the possible exception of the intestines.

Laboratory aids, such as x-ray plates of the head and chest, Wasserman tests, blood counts, sputum, urinary and other tests are frequently essential, and nearly always helpful in arriving at a correct diagnosis.

The presence and location of pain is important in trifacial neuralgias, but more especially so in involvements of the paranasal sinuses, and its location will frequently tell us the sinus affected, for example, the frontals give pain over the eyes and about the forehead; the anterior ethmoids, between the eyes; the posterior ethmoids, in the temporal region or about the ear and mastoid; the sphenoids, back of the eyes, in the occiput, or over the vertex of the skull; and the maxillaries, in the upper jaw and teeth with tenderness specially marked in the canine fossa, just above the canine tooth.

Tenderness to pressure is especially helpful in acute sinusitis, when it is to be elicited by

\* Read before the Audubon Medical Society, September 27, 1929, by invitation, as part of the symposium presented by the Special Committee on Periodic Health Examination of the New York County Medical Society.

pressure directly over the sinuses in the case of the antra, anterior ethmoids, frontals and mastoids; and by pressure on the eyeball often, in the case of the posterior ethmoids and sphenoids; also an area of hyperaesthesia can be made out over the corresponding Head zone.

In chronic sinusitis pain is not constant, although a very valuable sign when present. In both acute and chronic sinusitis pain denotes obstruction to drainage.

Pus in the nose or pharynx, except when due to acute processes, such as acute rhinitis and pharyngitis, is usually, presumptive evidence of sinusitis and a thorough search for its origin should be made by the various diagnostic measures, including transillumination, Roentgenograms, use of the nasopharyngo-scope to locate the ostium from which the pus is exuding etc. Frequently, multiple or pansinusitis is present, and when chronic, usually, calls for radical surgical measures.

Acute sinusitis will, as a rule, respond to conservative measures, such as tamponage with argyrol or other colloidal silver preparation, irrigations, sprays, suction, heat etc.

The paranasal sinuses, next to the tonsils, are the commonest sites of chronic or focal infections in otolaryngologic practice, and as a whole, are by far the most difficult to eradicate. This is especially true of the frontal sinuses.

Probably, no greater opportunity of helpfulness is opened by periodic health examinations than that of impressing on the minds of the laity the absolute need of medical care of colds and other respiratory disorders, till they are cleared up as neglect is often followed by chronicity; the late sequelae are legion and often most serious.

The number of fatalities from pneumonia and other acute infections, the result of chronic dripping of pus into the larynx, trachea bronchia and other parts of the respiratory tract, as well as, by absorption directly into the blood and lymph stream, is probably very great, although in the nature of things cannot be accurately estimated.

Deformities in the nose should be noted and where not due to injury or to postoperative dipping syphilis should be thought of and a Wasserman taken.

Perforations of the septum are most frequently postoperative results; but where no such history of operation is present, lues should be ruled out. Ulcers, both simple and tuberculous, are also causes of perforations in the septum.

Deviated septum is the commonest condition calling for operative interference in the nose and when it is causing obstruction to breathing or to drainage of the sinuses, or when a factor in progressive deafness, or as a preliminary to other nasal operations, a care fully performed submucous operation is one of the most satisfactory operations in surgery

Epistaxis occurs in about 90% of the cases, from the anterior portion of the septum, known as Kiesselbach's, or more correctly Lyttle's area, according to St Clair Thomson's Nose-bleed may be just a local manifestation or a symptom of a general condition, such as hemophilia, purpura, hypertension, cirrhosis of the liver etc.

Furunculosis about the ala nasi suggests the need of blood chemistry determinations, especially in reference to carbohydrate metabolism

The condition of the teeth and gums should be carefully noted, as infections in these regions affect the health and are amongst the commonest seats of focal infections causing rheumatic fever, the arthritides, endocarditis etc. Skiagrams should be taken, and cooperation of the patient's dentist should be sought

The lymphoid tissue of the throat is arranged more or less in the form of a circle and is described as Waldever's ring It consists mainly of pharyngeal adenoid, faucial and lingual tonsils on each side. These lymphoid tissues are the port of entry of many of the acute infections such as rheumatic fever, scarlet fever, diphtheria, Vincent's angina etc., as well as, being by far the chief offenders from the standpoint of chronic focal infections, and they are especially apt to be seriously diseased when they have been cut, but incompletely removed leaving stumps, sealed over with scar, which prevents emptying of the crypts into the mouth and throat, thus forcing absorption into the blood stream and causing more severe symptoms than where it is subjected to the germicidal and detoxicating action of the gastric juice

In the ordinary act of deglutition, the tonsillar crypts are emptied of their contents by the action of the throit muscles very much as a sponge filled with soap suds would be emptied by the muscular action of the hand

The other lymphoid tissues especially the phrty ngeal adenoid and lingual tonsils have a similar structure and are subject to the same acute and chronic infections—a fact often overlooked. A searching examination of these structures should always be made and if diseased, they should be completely removed. The indication is just as clear as for the faucial tonsil, and if neglected, the optimizer result will not be obtained.

There are many indications for the removal

of tonsils, but repeated attacks of acute tonsil litis, quinsy, enlarged cervical glands, chronic ally hypertrophied tonsils especially with congestion about the pillars and soft palate are very definite reasons for their removal. The more completely the lymphoid ring is removed the more satisfactory will be the result. The smallest piece of tonsillar tissue buried under scar may become an abscess cavity and is always a potential source of danger.

MacCready' and Crowe have shown that the tonsils are the chief entrepot of the bovine type of tubercle bacilli which do not ordinarily cruse gross lesions of the tonsils but enter the cervical lymphatics, causing enlargement of the glands, whereas the human type of tubercle bacilli cruse gross ulceration of the tonsil and is practically always secondary to pulmonary tuberculosis

Laryngeal examination may reveal chronic laryngitis pachy dermia or papillomata which are often due to chronic foci of infection in the tonsils or more especially in the paranasal sinuses and which will frequently clear up when the foci are removed. These are also potential precancerous conditions and have a definite importance in that connection especially if the patient is past forty.

Many cases of chronic bronchitis and bronchiectasis have as their underlying cause infection in the upper respiratory tract, either of the sinuses or of the lymphoid tissues of Waldeyer's ring

Periodic examination of the ears should reveal evidence of advancing deafness in oto sclerosis and in chronic catarrhil otitis media, also of nerve deafness, if due to lues or to focal infections

A chronic, discharging ear should be investigated especially for evidence of underlying mastorditis, which so often is the condition in, so called "chronic purulent of this media". When present a radical or modified radical mastord operation is usually necessary to clear up the condition and to remove it as a focus of infection and also to prevent intracranial complications.

#### Conclusion

More and more the need of keeping people well is becoming obvious and the desirability of preventing, or arresting the progress of disease, in its incipiency, is recognized everywhere, and it is the duty and function of periodic health examination to play a very important part in this great movement.

### PAPERS AT THE ANNUAL MEETING

The Committee on Scientific Work of the Medical Society of the State of New York is now making up the program of the scientific sessions to be held during the Annual Meeting on June 3 and 4, 1930, in Rochester. The Committee is especially desirous of offering to any member of the State Society the opportunity of submit-

ting a paper along some line of medical progress. Anyone wishing to present a paper is invited to communicate at once with the Chairman of the Section before which the paper is to be read. It is hoped that there will be a considerable number of responses to this appeal.

ARTHUR J. BEDELL, Chairman.

#### TUBERCULOSIS CONTROL

The attitude of practicing physicians to tuberculosis was the subject of serious discussion by the Committee on Public Health and Medical Education of the Medical Society of the State of New York, at its meeting on January 18th in the Hotel Pennsylvania R E Plunkett, Director of the Division of l'uberculosis of the New York State Department of Health, called attention to the great variability in the reporting of cases in different sections of the State, some sections reporting three cases for each death from tuberculosis and others reporting fewer new cases than there have been deaths in those sections. The sigmiscance of the failure to report cases is that it is evidence of the existence of larger number of cases which are not under medical advice and treatment, either by family doctors or by the official health authorities, or by any lay organization

Dr Plunkett asked the following question "What can the Medical Society of the State of New York do to stimulate physicians to take a more active interest in tuberculosis?"

It might seem that the amount and variety of effort already put forth would be sufficient to secure the diagnosis and treatment of every case of tuberculosis in New York State Both the medical profession and the people have been inoculated abundantly along anti-tuberculosis lines, but without a feverish response that is reflected in vital statistics

The weak point in anti-tuberculosis work seems to be the lack of leadership by the medical profession. The control of tuberculosis is a medical problem and its solution belongs to the medical profession. The question before the State Medical Society is this "Shall the physicians who will succeed in controlling tuberculosis be those engaged in general practice, or those employed by the State tuberculosis agencies?" As a matter of fact, both groups will be required—family doctors to give the detriled care to the great mass of patients, and a few experts employed by the agencies to act as consultants and teachers.

Although the control of tuberculosis is a medical problem, yet in this disease more than any other, the physician needs the cooperation and assistance of the patients, of governmental bodies, and of agencies doing social and wel fare work. Who among these four agencies shall be the leader? The answer of science and reason is, that physicians shall assume the leadership. The problem of the Mcdical Society of the State of New York is to make that leadership a reality in every county of the State. Experience has shown that wherever the physicians of a community lead, the public

will follow, for the people trust their doctors because of the stability of their character and the breadth of their knowledge and experience Groups organized along welfare and social lines have done most excellent anti-tuberculosis work, but their leadership has often been like that of the aniateur, and they have not made an effective appeal to the medical profession

Agencies both lay and official have supplied experts and made demonstrations of effective methods of work, but their activities have borne the inevitable fruit of developing inferiority complexes on the part of family physicians, as is shown by the doctors' tendency to say, "We cannot acquire the equipment and skill which the experts consider necessary for the diagnosis of tuberculosis, especially in its incipient stage, therefore let the State or some other agency do it? Some way of curing the physicians of their inferiority complex must be devised before family doctors will do effective tuberculosis work

A decade of experience has demonstrated that the most effective tuberculosis control has been done in those counties in which the leadership of family physicians has been recognized. Experience has also shown that the doctors can get what they want from governmental bodies and lay organizations if they ask for it earnestly and sincerely. The Medical Society of the State of New York now has the opportunity to develop a simple, practical plan for tuberculosis control. This plan will include the participation of family physicians, the patients, boards of health, and lay organizations.

Physicians must be the first group to be considered in the control of tuberculosis, for they will see the case originally and will carry out the details of home care Physicians must also be consulted by State Departments of Health and lay health originizations before any plus of action is instituted in a local complus of action is instituted in a local complusion.

munity

The County Medical Society is the natural organization of physicians to assume the leadership and to advise the other groups engaged in tuberculosis work. The first activity of the Medical Society of the State of New York will be to influence the county medical society of each county to engage in tuberculosis work and to assist the doctors to develop lines of work suited to that county

The patients must also be considered. Any comprehensive plan of anti-tuberculosis work will include that of personal contact with the patients and provision for supplying service for which the patient is unable to pay. An

essential provision for insuring frequent personal contact with patients is the visiting nursing servce. It is also essential that clinics, sanatoria and laboratories be established and maintained in each county for the direct service which they give to the patients. Another essential is that the directors of these facilities shall keep themselves in close touch with the practicing physicians. This system of visiting nurses, clinics, sanatoria, and laboratories is standardized and is well known to physicians generally; and county societies will promote the establishment of the system if they are inspired by the Medical Society of the State of New York.

Departments of Health and essential in any comprehensive plan of tuberculosis control, not only for their formal statistical work, but also because of the essential aid which they give the family doctors through their medical experts. The medical work of the New York State Department of Health is conducted satisfactorily to the family doctors, and its personnel is popular throughout the State. Its peculiar opportunity is now to cooperate with the Medical Society of the State of New York in inspiring leaders of county societies to formulate the plans for tuberculosis control in counties lacking present facilities.

Every county medical society needs the active help and influence of the County Tuberculosis Association and other lay organizations. These organizations also need the help of physicians in order to direct their work into practical channels. It does not seem, for example, that summer camps for undernourished children will reduce morbidity and mortality of tuberculosis to any great extent, at least in the immediate future. However, there is no question of the desirability and even necessity of the advice of local physicians in the use of the funds and the influence of the tuberculosis associations. The promotion of close cooperation between county tuberculosis associations and the county medical societies is one of the specific objects for which the Committee on Public Relations of the Medical Society of the State of New York was founded.

The answer to Dr. Plunkett's question is necessarily complex and involves the activity of many other groups besides the medical profession. However, the general answer may be given that the State Society can inspire each county society to study the tuberculosis problem in its own county, and to prescribe what each organization in the county shall do in developing a complete system for the suppression of tuberculosis.

### LOOKING BACKWARD THIS JOURNAL TWENTY-FIVE YEARS AGO

Advertisements: The question of advertisements was taken up by the Council of the New York State Medical Association on January 5, 1905. This Journal of February, 1905, has a copy of a letter from Dr. E. Eliot Harris to the editors of each of the twelve State Journals which then existed in the United States asking for a reply to a questionnaire on the subject of advertisements. Dr. Harris asked the editors four questions as follows:

"First, do you agree to publish no advertisement of an internal or an external remedy unless the quantity of its active ingredients be published?

"Second, do you agree to edit the copy submitted, and eliminate all so-called extravagant statements from it?

"Third, do you agree that the journal should introduce to its members through its advertising pages only those firms whose reputation for commercial integrity is such that their preparations will prove to be what they are represented to be?

"Fourth, do you agree to keep alive in your journal the question of ethical advertisements, so that the medical profession shall some day demand sworn statements of the quantity of the active ingredients of all internal and external medicines, advertised in medical journals?

"The above is merely suggestive, in the hope that by cooperation an organized and a united effort may be made to separate legitimate commercial interests in drugs and medicines from the illegitimate commercial interests of the nostrum venders; the medical profession directing its influence toward the first and against the second. Even from an imperfect beginning, something better and higher may be evolved."

The standards for which Dr. Eliot stood in 1905 are those of the New York State Journal of Medicine today.

### MEDICAL PROGRESS

Is Angina Pectoris Always Due to Coronary Artery Disease?-Thomas McCrae calls atten tion to the increasing tendency in the recent literature to consider the symptoms of angina pectoris as due to coronary disease exclusively, and to disregard the possibility of any other cause gina pectoris is a clinical syndrome with fairly marked features but without any definite single caus il pathological change. It should be clearly distinguished from acute cormary artery occlusion which has a definite pathological basis two cases which McCrae cites there were early attacks of angina pectoris, which were later followed by attacks due to coronary occlusion Both prinents stated that the early and later at tacks were entirely different, that the pain in the early attacks was beneath the upper sternum while in the attacks due to coronary occlusion the pun was beneath the lower sternum McCrae suggests that the early attacks were due to aortic He cites cases in which angina pectoris was associated with esophageal or gastric symptoms, with severe prostatitis and inflammation of the verumontanum, with invocardial insufficiency and with dilatation of the aorta. Thus, the statement, frequently made, that angina pectoris is always due to coronary disease does not seem to be supported by the evidence. It seems reason able to regard it as having a multiple etiology disease of the aorta in some cases of the coro nary arteries and myocardium in others, probably of both in some instances That it has other cruses in the way of viscero sensory reflexes seems probable Possibly these may represent The possibility of a nervous mechanism alone should not be entirely neglected -American Journal of the Medical Sciences, January, 1930 dxxx 1

The Newer Knowledge of Heart Disease finsley Randolph Harrison, writing in the South ern Medical Journal, January, 1930, xxiii, 1, emphasizes the general principles upon which the treatment of heart disease should be based aim of therapy should be four-fold (1) To rest the heart when this is necessary, (2) to strengthon the heart, if this is possible, (3) to alleviate the patient's symptoms, and (4) to educate the patient in regard to his disease. The last men tioned is perhaps the most important Unneces sary fears of sudden death must be allayed and the patient taught to live within his restrictions After the cirdic reserve has begun to diminish activity should be restricted to a level just below the dyspica threshold. When the patient begins to be short of breath on slight exertion digitalis is indicated. In the stage of paroxysmal dyspucalarge doses of the drug should be used

writer recommends digitalis leaves, 3 gm (45 grams), mide into 30 capsules, two to be taken three times a day for three days, then one capsule for four days a week, and later two capsules three days a week, watching carefully for digitalis intoxication If digitalis fails to prevent paroxysms of dyspnea, opiates are indicated. In severe cardiac asthma complicated with pulmo nary edema, morphine should be given and the prinent bled copiously In ventricular failure with systemic congestion and edema, digitalis is still of great value If, however, it is meffective diffreties are indicated. One of the best of these is theorine, in doses of 0.6 gm (10 grams) two or three times a day for one or two days it should be discontinued for a week or ten days Between courses of theorine, salyrgan, a very potent diuretic, is indicated. It should be given in doses of 1 or 2 cc intravenously, not oftener than once or, at most, twice a week. The neces sity for preventing and controlling edema cannot be too strongly emphasized. The patient with dropsy should be kept in bed and sleep insured by means of sedatives, when possible, hypnotics of the barbital group or chloral should be given in preference to opintes. The total fluid intake should be limited to two pints in winter and three The Karell diet with restricpints in summer tion of salt is indicated. As soon as the edema disappears, it is important that the patient's strength be maintained by a liberal mixed diet Quinidine may improve the rhythm in auricular fibrillation of a few weeks' standing, but there is grave risk in giving it to a pitient whose heart failure is of years' duration

Alastrim, Variola, and Vaccination -Prof Erich Leschke of Berlin after a survey of the incidence of various and its congeners throughout the world, arrives at the following conclusions He would make a rule to segregate all travelers with eruptions who have come from smallpox countries until a diagnosis can be made by the microscopical recognition of the Guarmeri bodies and Pirquet's vaccinal test. Alastrim or mild variola must be dealt with with the same severity as malignant smallpox-that is quarantine must be strict and exposed persons must be at once vaccinated, for the dangers from vaccination are f ir less than those of possible variola vera. Even a mild epidemic is far worse than a possible death Vaccinition must also be from encephalitis carried out thoroughly The author regards alas trun as true smallpox which one may distinguish by the term initigated smallpox. He is out of sympathy with Plehn when the latter would exclude Kaffir pox from the domain of variola in insisting that there is not even a kinship with

smallpox. Alastrim under one or another name is at present native in all the Americas, in the Azores, Switzerland, Holland, and England. differs from the severe type, chiefly in its low mortality which is about 1 per cent. In essentials it is the same, due to the same virus, and preventable through vaccination. Naturally all possible precautions against encephalitis should be observed. Alastrim shows a multiform symptomatology which makes it easy to confuse it with harmless eruptions and especially with chickenpox. There is a diminished tendency to pus formation and scar formation and at the height of the eruption the subject is usually in good general condition. The chief evidence for identity is the fact that in epidemics of alastrim a few patients may present all the symptoms of severe variola. The author, however, cites no example in which epidemic alastrim passed over into malignant variola. - Münchener medizinische Wochenschrift, December 13, 1929.

Controversial Points in Obstetrical and Gynecological Practice.—John Osborn Polak observes that the art of obstetrics is fast passing into history and has been supplanted by surgical intervention which needs curbing. He deplores the present-day tendency to submit women with slight pelvic contraction to cesarean section inasmuch as a very large proportion of labors (from 60 to 80 per cent) in this class of pelves terminate spontaneously. In his clinic each woman with a contracted pelvis is checked at weekly intervals during the last six weeks of pregnancy by Muellerization of the head, and the fetal posture and the general condition of the soft parts are ascertained. This allows, if necessary, the induction of premature labor. The attempt to shorten the second stage of labor by elective version increases the fetal and infant death rate. The routine use of prophylactic forceps is another menace to rational midwifery. The one rule for the safe conduct of the second stage of labor is to watch and record the rate and character of the fetal heart beat during and after each pain. The toxemias of pregnancy are another subject which is ever debatable. It is now generally admitted that a disturbance of the carbohydrate ratio is a basic factor, at least in the early toxemias. The fluid intake must be increased and the carbohydrate deficiency corrected. If the patient loses weight hospitalization with absolute isolation is imperative. The fluid loss must be made up by hypodermoclysis and intravenous infusion of dextrose until diuresis is produced. If hyperemesis continues after a week of this treatment, the uterus should be emptied under morphine and scopolamine narcosis and infiltration anesthesia. The treatment of the preeclamptic state is essentially medical, since the toxic patient is a very poor surgical risk. In the presence of convulsions the indications are never surgical. In the treatment of retroversion the pessary has many virtues which are unappre-

ciated by the surgeon. It will cure acquired retroversion if the uterus can be completely replaced and if the muscular structure in the pelvic floor will hold the pessary in place. Since 1910, in the author's postpartum follow-up clinic, each patient is instructed to assume the knee-chest position night and morning, is taught the "monkey trot" (walking on all fours), and is told to return at the end of a month. Then, if the uterus is retroverted, it is replaced and a properly fitting pessary is adjusted. Under this plan, the incidence of postpartum retrodisplacements has been reduced from 38 to 2 per cent.—Canadian Medical Association Journal, December, 1929, xxi 6.

Intermittent Biliary Stasis.-F. König refers to a type of gall-bladder disease in the absence of stone which has been known by various designations, the author favoring "intermittent biliary stasis." He has six such cases on record, comprising different anatomical conditions. The patients complained of intermittent stomach pains with negative stomach finds. Operation showed the galf-bladder empty, relaxed, not even inflamed, but invested (in 4 cases) with a membrane apparently the result of an error of development of the peritoneum. This formation constricted the gall-bladder, producing a hindrance to the flow of bile. It is probably readily confused with adhesions, which are of course often found about the gall-bladder. The remaining two patients showed each a peculiar and rare anomaly which likewise caused constriction of the organ. The process is purely a mechanical one due either to abnormally developed peritoneal ligaments or to abnormal formation of the lobes of the liver. When the gall-bladder is found filled at operation it may be emptied by manipulations which do away with the constriction; while in membranous cases division of the membrane leads instantly to the same result. It is evident that permanent stasis does not result from the constriction, as would be the case in obstruction of the common duct by a stone. There is therefore a sort of parallel between this condition and certain cases of intermittent hydronephrosis. Tension of the gall-bladder and irritation of the nerves give rise to a picture which suggests ordinary biliary colic from stone. Whether such constriction of the bladder leads eventually to stone formation is not apparent but the author assumes that it will, even although none of his six patients, after years of colic. showed any evidence in that direction. Schmieden would extirpate all such bladders, but the author prefers to leave the question open.—Münchener medizinische Wochenschrift, November 22, 1929.

The Nature and Diagnosis of Constipation.—After discussing the symptoms of constipation and the mechanism of peristalsis, Geoffrey Evans states that in order to make a diagnosis of constipation we must have a measure of the normal

rate of passage of the intestinal contents. A comparison of the figures of various investigators leaves no doubt that, normally, food residues take considerably more than twenty-four hours to pass through the digestive tract. It is a common opinion that the bowels should be empty, but the medical profession is in a position to assure the public that the bowels should normally contain food residues. The two parts which are usually empty are the gullet and the rectum. The physician should not accept the patient's diagnosis of constination, but should establish the diagnosis by the history and clinical examination. Constipation occurs in two forms: (1) Colon constipation, which may be due to a sluggish, a spastic, or an atonic colon; (2) dyschezia, or failure of the rectum and pelvic colon to empty. With a view to accurate diagnosis the patient who complains of obstinate constipation is advised to take a low residue diet, one or two drachms of paraffin oil every night, to stop laxatives, and to report at the end of 72 to 96 hours. At that time rectal dyschezia will be diagnosed by finding the rectum full of feces; sigmoid dyschezia is diagnosed in the same way. When there is a sluggish or atonic colon, the abdomen has a doughy feel and the colon can be palpated. In some cases the diagnosis can be made only by x-ray examination, as when more than one form of constipation is present. It is important that the result of bowel activity be at least seen, if not examined more in detail. A study of Pavlov's work on conditioned reflexes, which are the basis of so-called habit, makes it easier to understand why some people eat one kind of food and others another kind, and makes it evident that one should hesitate before trying to change the patient's dietetic habit. At the same time it is obvious that rectal dyschezia requires a full residue diet and a soft stool, while a spastic colon must be given rest by the prescription of a low residue diet. Where medication is necessary, the drug should be one which can be used indefinitely without variation. A laxative which requires changing is unsuitable. As the colon is more sluggish during the night than during the day, it should not be unduly stimulated by an evening laxative.—British Medical Journal, December 7, 1929, ii, 3596.

Malta Fever in the United States.—Charles W. Wainwright has collected 74 cases of Malta fever occurring in the United States, to which he adds eight cases of his own. From the available data he has been able to classify 51 cases as instances of abortus infection and 25 as melitensis infections. The melitensis infections occurred in a rather limited area, the Southwest, where goats are raised, while the abortus cases were generally distributed throughout the United States. According to board of health reports, the disease is much more prevalent than the literature would indicate. It occurs during all age periods, but predominantly during adult life. It is apparently much more frequent among males than temales.

Occupation played no special rôle except in the melitensis infections, where there was a history of close contact with goats. Insidious onset was the rule in both types of infection. The physical findings were in no way characteristic. Gastroenteric symptoms were present in 84 per cent of the melitensis infections and in 70 per cent of the abortus infections. Constipation was much more frequent in the melitensis cases. Orchitis was a frequent complication in the melitensis cases. It was not unusual for the physical examination to The most common abnorbe entirely negative mality was enlargement and tenderness of the spleen, which was palpable in 48 per cent of the melitensis cases and in 32 per cent of the abortus cases. The organism was recovered from both the blood and urine more readily in the melitensis infections. Leucopenia or normal white cell counts were the rule, and there was frequently a lymphocytosis. The disease may be present and the organism recovered in the absence of positive agglutination reactions. The melitensis infections were generally more typical and more severe than the abortus infections.-Southern Medical Journal, December, 1929, xxii, 12.

The Human Heart During and After Nitrous Oxide Anesthesia,-G. E. S. Ward and Samson Wright made electrocardiographic observations on sixteen healthy young students before, during, and after nitrous oxide anesthesia. The results show that striking functional changes take place in the heart during the inhalation of pure nitrous oxide. These are: (1) Marked tachycardia; (2) reduction, abolition, or inversion of the T wave in Lead II; (3) reduction of the R wave; (4) variable changes in the P wave; (5) little change in the P-R interval. The auricle shows various changes, but conduction in the bundle of His is but little altered. When pure nitrous oxide is breathed an extremely severe anoxemia is acutely produced, to which the tachycardia and modifications in the T wave are There is a general consensus of opinion that abolition or inversion of the T wave in Lead II indicates serious functional or structural cardiac derangement. It, therefore, seems justifiable to conclude that the change produced during anesthesia with pure nitrous oxide seriously depresses the ventricular myocardium. The change is of a temporary nature and is rapidly recovered from, but even in the healthy subjects recovery was sometimes not complete after several minutes It is possible that in patients with heart disease the immediate changes might be of a more serious nature and more lasting. In such patients pains should be taken to avoid any anoxemia developing by giving adequate amounts of air or oxygen with nitrous oxide.-The Lancet. December 7, 1929, ccxvii, 5545.

The Atmosphere and Disease.—Dr. de Rudder makes a contribution to what he terms "general meteoropathology," which is chiefly a review of recent efforts along this line. The subject is an enormous one and the author first seeks a method of approach. One of the most obvious is naturally the study of the individual disease on a background of the weather, as understood by the science of meteorology. Diseases affected in their incidence by the weather are termed "meteorotropic," and the list includes some affections not commonly associated with weather conditions, as puerperal eclampsia and appendicitis. Cumulation of cases in certain well known atmospheric extremes must have some significance. In another group of affections the relation between the individual diseases and the weather is known to all, as in respiratory and rheumatic affections. A distinction must be maintained between weather per se, the season of the year, and the climate. In some maladies the association is obvious-thus in warm season we see "summer complaints," sunstroke, etc. But in another group the association is far less obvious. Seasonal incidence may be influenced indirectly, as when disease spreads in the winter through indoor overcrowding. There is naturally a relationship between sunshiny days and all three categories of meteoropathology—weather, season, and climate. Under the head of climate we have to consider the possibility of change in the same over centuries of time. These changes are largely imagined as the result of a rhythm of longer or shorter duration. Diseases which have been studied over a considerable period of time show fluctuations which may be attributed to the short rhythm of climate—characterized by periods of 30 to 35 years. The motivation behind this rhythm is based largely on the dryness or moisture of the air. Diphtheria is believed to fluctuate in severity with the short or socalled Brückner rhythm.—Klinische Wochenschrift, December 3,

Von Kapff's Acid Therapy in Bronchitis.— A. Hotz writes at great length on this subject giving his results in 20 cases. Von Kapff is apparently a chemist, not a medical practitioner, who has remarked the frequency of immunity of workers who inhale acids to certain affections of the respiratory apparatus and the fact that workers who suffer from these complaints are greatly improved when forced to inhale acids. The affections are all chronic and comprise bronchitis. forms of asthma, and certain cases of tubercu-The substance inhaled must be gaseous and dry and of course an acid. As a pediatrist the author sought to try out the method in the respiratory affections of children. His best results have been obtained in bronchial asthma and asthmatic bronchitis. While not all are benefited the improvement in the majority is striking, although there is no sudden interruption of the paroxysms such as sometimes follows the use of atropine and adrenalin. Instead the attacks be-

The claims made come progressively weaker. that the inhalations prevent the development of influenza he cannot confirm. The method is by no means new for Von Kapff first introduced it in 1910. The medical man who was the first to sanction the method was Hartmann. Apparently the choice of acid is immaterial for the author mentioned hydrochloric, acetic, sulphuric, and formic acids as efficient in the industries. beneficent action may be a bactericidal one or it may be due to the fact that inhalation of acid gas paradoxically increases the alkaline index of the blood. There are two methods of exhibition, the first of which parallels conditions in factories, the air of the room being impregnated by the acid fumes. The second method involves the use of an inhaler and mask. The first method is readily carried out by saturating a carton with some acid and placing it in a saucer in the sleeping room of the patient. When the patient is not in his room an insulating cover is placed over the carton.—Schweizerische medizinische Wochenschrift, November 23, 1929.

Origin of Cancer of the Rectum from Polypi. -Professor V. Schmeiden of Frankfurt read a paper on this subject in 1926 and now gives his experience of the past three years in the same field. He is concerned especially in the development of adenocarcinoma of the rectum and colon from polypi, and his paper refers rather to histological than clinical finds. Many of these polypi contain the socalled precancerous cells and the author is inclined to the opinion that all cancer of the colon may be of this origin. In this view he is by no means alone—in fact he believes that the majority of surgeons are in agreement with him, although the same cannot be said of the pathologists. Sauerbruch, however, dissents wholly from this view and states that a convincing proof of any definite relationship between polypus and cancer has never been submitted. It is true that absolute proof is difficult, but one may note the presence of beginning cancer in polypi, in both colon and rectum, and one may also see cancer occurring with polypi in the same part of the gut. Moreover in cancer the microscope will sometimes reveal residues of polypi. A fourth form of evidence, and one which the author was the first to describe, is a peculiar arrangement of the fields of certain polypi under the microscope; if this is followed up in serial section, the flower-bed like fields may be found at times to lead to genuine cancerous tissue. Numerous sections of tissue, all of low powers, are pictured which show the presence of both kinds of tissue in polypi and cancer respectively. Although an exact transition between the two cannot be shown, the author believes that his four types of evidence amount virtually to proof. -Deutsche medizinische Wochenschrift, November 29, 1929.

### LEGAL

#### MOTOR VEHICLES—CONNECTICUT STATUTE UPHELD

By LLOYD PAUL STRYKER, ESO. Counsel, Medical Society of the State of New York,

In increasing numbers within the last decade, our Courts have had before them the so-called "guest automobile" cases. At first blush it might appear strange indeed to read of cases where. despite the amicable relations between the parties, we find a husband suing a wife, a brother a sister, or a guest his host, in connection with claimed injuries resulting from the negligent operation of a motor vehicle. To find the reason for this condition, one has not far to seek. It will be found upon examination that the defendant in this class of cases is always insured, and hence in the event of an adverse verdict pays nothing out of his pocket.

So often have these cases been fraught with obvious collusion and fraud between the litigants, that the entire matter has been the subject of a great deal of criticism, and in some States of legislative inquiry. The situation has, of course, brought about an increase in the rates for liability

insurance.

The community sentiment against this type of case was crystalized into a statute passed by the legislature of the State of Connecticut in 1927. This statute (Chapter 380 of the Public Acts of Connecticut of 1927) reads as follows:

"Section 1. No person transported by the owner or operator of a motor vehicle as his guest without payment for such transportation shall have a cause of action for damages against such owner or operator for injury, death or loss, in case of accident, unless such accident shall have been intentional on the part of said owner or operator or caused by his heedlessness or his reckless disregard of the rights of others.

"Section 2. This act shall not relieve a public carrier or any owner or operator of a motor vehicle while the same is being demonstrated to a prospective purchaser of responsibility for any injuries sustained by a passenger being transported by such public carrier or by such owner

or operator,"

Subsequent to the passage of that statute, a woman brought suit against her husband for injuries claimed to have been sustained in a motor vehicle while it was being operated by the husband. The lower Courts, basing their decision on the statute above quoted, denied relief to plaintiff. She thereupon appealed to the Supreme Court of the United States, contending that the statute denied her the equal protection of the law guaranteed by the Fourteenth Amendment. The Supreme Court of the United States unanimously affirmed the action of the Courts below, and upheld the constitutionality of the statute.

The Court writing through Mr. Justice Stone, in discussing the question under consideration.

said:

"The use of the automobile as an instrument of transportation is peculiarly the subject of regulation. We cannot assume that there are no evils to be corrected or permissible social objects to be gained by the present statute. We are not unaware of the increasing frequency of litigation in which passengers carried gratuitously in automobiles, often casual guests or licensees, have sought the recovery of large sums for injuries alleged to have been due to negligent operation. In some jurisdictions it has been judicially determined that a lower standard of care should be exacted where the carriage in any type of vehicle is gratuitous. \* \* \* Whether there has been a serious increase in the evils of vexatious litigation in this class of cases, where the carriage is by automobile, is for legislative determination, and, if found, may well be the basis of legislative action further restricting the liability. Its wisdom is not the concern of courts.

\* \* \* It is said that the vice in the statute is not that it distinguishes between passengers who pay and those who do not, but between gratuitous passengers in automobiles and those in other classes of vehicles. But it is not so evident that no grounds exist for the distinction that we can say a priori that the classification is one forbidden

as without basis, and arbitrary. \* \* \* Granted that the liability to be imposed upon those who operate any kind of vehicle for the benefit of a mere guest or licensee is an appropriate subject of legislative restriction, there is no constitutional requirement that a regulation, in other respects permissible, must reach every class to which it might be applied-that the Legislature must be held rigidly to the choice of regulating all or none. \* \* \* In this day of almost universal highway transportation by motorcar, we cannot say that abuses originating in the multiplicity of suits growing out of the gratuitous carriage of passengers in automobiles do not present so conspicuous an example of what the Legislature may regard as an evil, as to justify legislation aimed at it, even though some abuses may not be \* \* \* It is enough that the present statute strikes at the evil where it is felt and reaches the class of cases where it most frequently occurs.

Among the class of persons adversely affected

by this statute is that public pest, the "hitch-hiker." This individual has long been a public nuisance, and his status under the statute here discussed will bring no grief to anyone whose generosity in assisting one of these individuals in "hitch-hiking" from one place to another, has been rewarded by a strike suit for claimed in-

juries, brought in the hope that some small settlement may be obtained.

The evils which led to the adoption of the Connecticut statute are present in our own State, and it would seem that our legislature might do well to emulate the example of the State of Connecticut.

## CLAIMED FAILURE TO PROPERLY TREAT COMPOUND COMMINUTED FRACTURE

In this case the plaintiff came to the defendant doctor with a history of having fallen from a public conveyance and having sustained an injury to her ankle. A fluoroscopic examination of the ankle was made which revealed a compound comminuted fracture of the lower end of the tibia and fibula, contusions and abrasions from the knee to the heel. The leg was placed in temporary splints and a solution of lead and opium wash was prescribed for the contusions and abrasions. following day the patient was visited at her home, the splints taken off and the leg appeared to be covered with large infected blebs which were opened and dressed with sterile gauze dressings and the splints replaced. The same treatment was continued for a period of ten days, at which time the blebs cleared up and the patient called at the doctor's office. On the twelfth day after the injury the ankle was again fluoroscoped and the bones found in fairly good position with union beginning. By manipulation under the fluoroscope the bones were placed in perfect position and molded plaster splints applied. The patient was seen at her home at regular intervals during the following month. On the occasion of the doctor's visits the splints were tightened and the condition of the leg observed. Thereafter the patient called at the doctor's office for the next three weeks, her fracture examined under the fluoroscope and good union found. During this period baking was prescribed and given at the doctor's office. Although the patient, in the doctors' opinion, required additional baking, the patient did not return to the office for a period of approximately three months, at which time she called at the office, limping. The fracture was again fluoroscoped, the bones found in good position with good union, but the leg was swollen.

More baking was advised and after receiving treatment on that occasion the patient did not return.

Thereafter the patient instituted an action against the physician alleging that the defendant physician was negligent in prescribing the lead and opium solution which caused a condition of blistering, by reason of which the plaintiff suffered great pain and anguish, and prevented the proper setting of her fractured bone for a long period of time; that thereafter the defendant carelessly and unskillfully set the bones and unskillfully placed plaintiff's foot and leg in a plaster cast, causing the bones to improperly knit; that by reason of this improper union the plaintiff was compelled to submit to an open operation for the purpose of properly setting her fractured bones; that prior to this operation the plaintiff found it necessary to have X-rays taken and to be confined in a hospital for a long period of time, and learned that her foot and ankle were in a dangerous condition; that the operation resulted in a rebreaking of the bones and a proper setting; that prior to the operation the plaintiff advised the defendant of the result of the X-rays, but that he advised her against any course except waiting until her ankle had properly healed and to exercise the limb.

The case came on for trial and it was established at that time that it was proper to wait several months after the setting of a fracture before an open operation is performed, and the physician who performed the open operation testified that the result he obtained was very little better than that which the plaintiff had received at the hands of the defendant. The issues raised at the trial, however, were submitted to the jury who returned a verdict in favor of the defendant doctor.

### RECTAL ABSCESS—CLAIMED NEGLIGENCE IN TREATMENT

In this case the complaint charged that the plaintiff was suffering from an abscess of the rectum, and went to the defendant's office for treatment; that the defendant operated upon the plaintiff for the purposes of doing away with the abscess, and after the performance of the opera-

tion informed the plaintiff that he would be completely cured in about two or three weeks, and that it would not be necessary for the plaintiff to go to a hospital during the period of his treatment, nor would he lose any time from his business. I he complaint further charged that a few days after the operation the defendant, without informing the plaintiff of the necessity therefor, operated upon the plaintiff again and thereafter informed him that said operation was necessary to hasten plaintiff's recovery, and that thereafter the plaintiff visited the defendant daily for treatment, that about three weeks after the first operation, the defendant again operated upon the plaintiff informing him that it was necessary to hasten the healing of the wound

The complaint further charged that the defendant then informed the plaintiff that he was leaving on an extended vacation, and prescribed certain treatments to be administered by the plaintiff's wife during the absence of the defendant, that thereafter the plaintiff attempted to have the said treatments prescribed by the defendant administered to him by his wife, but found that the pain was so great that he was compelled to visit another physician, who again operated upon him

and gave him extensive treatments

It was claimed in the plaintiff's bill of particulars that as a result of the defendant's negligence, the plaintiff suffered excruciating pain, and was injured in the region operated upon by the defendant, and suffered great pain in his spine Damages were prayed for in the sum of \$25,000

From the facts it appeared that the plaintiff, a middle-aged man, came to the defendant's office, and upon examination the doctor found that he had a rectal abscess. The doctor incised the abscess under a local anesthetic, and dressed it. The patient returned to the doctor's office daily for about a month, and on each occasion the doc

tor dressed the wound. About that time the doctor found that an abscess had formed in a pocket alongside the old abscess. This the doctor opened under a local anesthetic, and after this the plaintiff kept coming back for dressings almost daily for a month and a half, at which time the abscess had healed from the bottom. The doctor had carefully explained to the patient exactly what he was doing with respect to the patient's condition, and the plaintiff thoroughly understood the treatment rendered.

About thus time the defendant was leaving town on his vacation, and he told the man that further dressings would be done by another physician who was assuming his practice during his absence. This physician was located just around the corner from the defendant, and the defendant give to the plaintiff the name of this doctor and his address and told the plaintiff to be sure to go to him for further dressings. This the plaintiff agreed to do, but he never returned to either the defendant or the physician to whom the defendant had referred him.

Subsequently it appeared that the plaintiff developed a rectal fistula for which he was treated by another physician, which fistula after two months' treatment entirely heafed

The plaintiff paid to the detendant a substantial part of the defendants bill but refused to pay the balance, and when the defendant threat ened to place the matter in the hands of an attorney for collection, this action was brought. The action appeared on the day calendar, and the plaintiff failing to appear, on our motion the action was dismissed.

#### CLAIMED NEGLIGENCE IN THE ADMINISTRATION OF LIGHT THERAPHY

In this case a young man came to the doctor's office with a history that he had slipped in his place of business and fallen on his wrist. The doctor examined him, and found a slight sprain of the wrist. He thereupon directed his assistant to give the patient light therapy. This treatment was thereupon given to the plaintiff's wrist for a period of five minutes. The man returned on three other occasions, when exactly the same treatment was given his wrist. When he returned the fourth time, the doctor upon examination found that he needed no more treatments and discharged him.

The plantiff at no time displayed any sign of a burn. The doctor's machine was in perfect condition, and the apparatus was in all respects properly attached before the treatments were rendered to the pritient.

Subsequently the patient sued the doctor, the complaint charging that in attempting to cure and heal the plaintiff's arm, the doctor negligently and improperly baked and exposed the plaintiff's arm to a certain mechanism for a longer period of time than the defendant should have done if he had used proper care and diligence, as a result of which the plaintiff was greatly injured in his health and constitution, suffered great pain and anguish and was prevented from attending to his business, and his right arm was permanently injured.

After the defendant's answer was filed the plaintiff never noticed the case for trial, and finally on our motion the same was dismissed for lick of prosecution, thus terminating the action in the doctor's favor

# NEWS NOTES

### DUTCHESS-PUTNAM COUNTY MEDICAL SOCIETY

### REPORT OF THE COMMITTEE ON PUBLIC HEALTH AND PUBLIC RELATIONS

The Committee on Public Health and Public Relations of the Dutchess-Putnam County Medical Society begs leave to offer the following report of its activities for the year 1929:

Altogether, your Committee feels that the year just past has been a very successful one as regards Public Health and Public Relations; and remembering that this is only the second year of the Committee's existence, we are justly proud of what has been attempted, and in a great measure achieved.

The recommendations suggested by the Committee a year ago, and adopted by the Society, are worthy of brief consideration as part of the Committee's activities during 1929.

The Toxin and Anti-toxin campaign against Diphtheria has been continued with satisfactory results. Especially has this work for the pre-school child been effective, and all doctors who have co-operated either publicly or otherwise are to be congratulated on the success attained.

While figures for 1929 are not yet available, the Committee feels the results will be most gratifying.

The Infant Welfare and pre-school clinics have been continued and the attendance satisfactory. A new clinic was established at Wappingers Falls; and Poughkeepsie, Beacon, Rhinebeck and Wappingers Falls now hold regular clinics, and eight were held in other

rural districts.

The recommendation that this Society attempt to work out some plan with the Dental Society, for the improvement of the dental defects so prevalent among the children, has not been accomplished, due to the fact that the Committee has not made contact with the Dental Society in regard to this matter.

The Tuberculosis clinics have been continued, and are being held regularly in some

sections.

Four regular pre-natal clinics have been established at Millbrook, Pine Plains, Red Hook, and Vassar Hospital in Poughkeepsie, and one is being established at Wappingers Falls. These clinics are held monthly; and while the attendance is not large, the most encouraging feature of the work is the interest shown by the local physician conducting the clinics.

The survey of crippled children in the County has been made by one agency, but such

survey was not considered to be complete enough by the Committee, and so another is being conducted by another agency, which we feel will be quite satsifactory when finished.

The Board of Supervisors again appropriated \$500 for honorariums to physicians conducting various clinics. They were not asked for more money this year, for it was felt that in those communities where definite health activities were undertaken and funds raised for these matters, such towns or villages should pay instead of the county at large.

During the year the Dutchess County Health Association added to its Board of Directors the Chairman of the Public Health and Public

Relations Committee of this Society.

The question of the Infant Mortality Rate in Poughkeepsie referred to this Society by the Poughkeepsie Board of Health, and delegated to this Committee, has been given considerable consideration, and the findings of such investigation are embodied in this report at its close.

Such in brief is a summary of your Committee's activities for 1929; and again at this time the Committee desires to extend to the Dutchess County Health Association and other agencies and especially to Miss Dorothy Carter, the executive secretary of the Association, the thanks of the Committee for the valuable assistance and co-operation received. The Committee feels that the spirit of co-operation shown and the friendly relations maintained between the Society and these lay agencies have been of inestimable value in improving the health conditions of the County.

The Committee would make the following recommendations for your consideration:

1. Continuation of the Toxin-Antitoxin work. Particular effort should be made to finish up or catch up, especially with the preschool child, and permanent plans made for carrying on the work in the following years.

In this connection, the message of Dr. Mathias Nicoll, Jr., State Commissioner of Health, given at a recent meeting of the Diphtheria Commission, is not amiss, and expresses the views of the members of the Committee much better than they could attempt to do in their own verbiage:

"Until the medical profession is able to Iay aside its cloak (of ethical reserve) and forget the attitude that they are soliciting trade from patients, the campaign will never be success-

ful. It is up to the medical profession to have the children of their clientele immunized. The campaign will never succeed unless the doctors are willing to do their part in looking after their patients children and have them immu nized continually '

2 Continuation and increased interest in the tuberculosis work. with especial given to the examination of groups of children for childhood tuberculosis, which still seems to be the weak spot in the reduction of mor tality from tuberculosis

3 Continuation of the regular, and inception ot more, Child Welfare chinics, throughout the County While the Committee feels that this is more of a nursing problem, yet pressure by the members of this Society in their own communities will do much to incite added interest

4 The pre-initial clinics should be continued and new fields opened up. The Committee feels that this is of great importance, for only by increased work in this and the Child Welfare work, can a decided reduction in infant mortality be

accomplished

In this connection, it is also urged that the members of this Society give serious consideration to the importance of breast feeding most appalling to see the vast number of babies that are being put on the bottle and only through the insistence by the doctors that mothers nurse their babies can this evil be overcome, and an other aid in the reduction of infant mortality be accomplished

These are practically the same recommenda tions that were made in the previous report, given one year ago, and your Committee has but one further recommendation to make, but before sug gesting that, we concur in the message of the State Commissioner of Health, as follows

'It is customary to make resolutions beginning with a new year. As Commissioner of Health, I would suggest for 1930 that all agencies, interested in the health of the public, shall devote their energy to perfecting work already under way, which in many instances is a mere scratch on the surface of most important public health prob lems, rather than suggest additional activities, the adoption of which have very frequently resulted in the neglect of well established programs other words, let us resolve to accomplish still more definite results in the protection of health and the swing of life, insofar as possible under the present provisions of the law and with the financial resources available from public and private agencies, before venturing into new fields, however attractive they may appear "

During the pist year, your Committee has given considerable attention to the question of County Health Departments, and has watched with great interest the development of such in Catturingus and Suffolk Counties After studying the investigations undertaken by Cortland and Westchester Counties, which have also adopted the idea, it is not amiss at this time to bring certrun facts to the attention of the Society for its serious consideration

In matters concerning the betterment of conditions regarding roads and other engineering prob lems and the relief of the poor, or what is known as Public Welfare the State has taken a decided stand and passed laws, so that all matters concerning the building and upkeep of roads is now in the hands of the County Engineer, and not a Iown Road or Highway Commissioner as heretofore, and all poor relief is delegated to one head, namely, the Public Welfare Officer of the County, thereby concentrating the activities of these bodies for the general betterment of service and economy

So in matters of Public Health, six advantages

have been cited as follows

I Centralization of authority in one board, with the consequent elimination of conflicting au thority between townships and villages

2 Availability of expert professional personnel beyond the ability of a single township to finance, giving full time service in all branches of public health administration

3 More and better service for the same ex-

penditure of money

4 An organized unit for prevention of disease. and a continuous program for the entire county with special emphasis on problems requiring community efforts 5 An organized unit for the prevention and

suppression of epidemics of disease

6 An official central organization for the cor-

relation of all health activities

This does not at present do away with the various Health Officers in the various towns or cities, but makes them Deputy Health Officers to the central authority

Furthermore, fifty per cent of all moneys ap proprieted for such work by Boards of Supervisors, is paid back by the State. Thus it will be seen that such an arrangement is of great advantage to any county adopting a County Health Department

After giving this matter very serious consideration, your Committee recommends

5 (a) That this Society approve and en dorse the establishment of a County Health Department in Dutchess County, and petition the Board of Supervisors at their next meeting, for a thorough investigation into its merits, with the ultimate idea of adoption of such Department for Dutchess County

(b) I hat this Society request the Dutchess County Health Association to co operate in whatever way possible, looking toward the

adoption of such Department

Concluding this part of its report, the Com-

mittee wishes to thank all members of the Society for the cordial co-operation that has been given, and asks you to work with the new committee on Public Health and Public Relations as well as you have with us, for only by giving any committee loyal support can anything of importance be accomplished.

What a County Medical Society is expected to do is best given in an address by the President of the Illinois State Medical Society and reported in the Illinois Medical Journal for Oc-

tober, 1929:

"There are many things that the members of a County Medical Society can do, should do, and are expected by the public to do, for the good of their communities. They should not only be the advisers, but should assume leadership in all matters pertaining to the public sanitary measures. They should disseminate knowledge needful to a clear understanding of

the cause, prevention and cure of various diseases. They should be active in measures necessary for correction of the physical defects and ailments of children, in order that they may not be handicapped throughout life and become a burden to the community, state, and nation.

"Sickness and death are no longer looked upon as a private personal matter that concerns only the patient and the physician. The public is taking an interest in the conservation of health and life; and unless the medical profession assumes leadership in these measures, they will soon be riding in the rear seat and be embarrassed and humiliated by seeing laymen at the steering wheel."

JOHN A. CARD, Chairman. W. A. Krieger AARON SOBEL

# DUTCHESS-PUTNAM COUNTY MEDICAL SOCIETY REPORT OF THE COMMITTEE ON INFANT MORTALITY

The Committee on Infant Mortality of the Dutchess-Putnam County Medical Society submits the following report for the year 1929:

The infant mortality rate is in reality the index of the sanitary progress of any community. With the possible exception of tuberculosis, there is no other question before us upon which we have so much absolute knowledge as to the answer.

We are beginning to recognize the vast difference between theory and practice, between what ought to be done and what must be done, if we are definitely to lower the infant death rate and keep it to its normal ratio. This subject has been thoroughly and exhaustively discussed from almost every point of view.

The truism that fifty per cent of infant deaths are preventable has become trite through frequent repetition. They are prevent-

able but not prevented.

Sherman S. Kingsley once said: "Where the white hearse goes most often, there you will find the weakest places in your municipal

housekeeping."

Infant mortality is a complex problem. The many factors may be classed as sanitary, social, hygienic, economic, humanitarian, and individualistic. Every factor must be reckoned with, every beneficent feature used to its utmost, and every undesirable one eliminated, and even then only the high spots may be touched.

Because of the recent publicity given in the newspapers to the infant mortality rate for 1928 in Poughkeepsie, the Board of Health has referred to this Society this question, and your

Committee has given the matter enough serious consideration to venture the statement at this time that Poughkeepsie's infant mortality rate is not high, comparable with other cities in the State with similar population. As a matter of fact, in the eleven Cities of New York State with a population of from 25,000 to 50,-000, Poughkeepsie, during the nine years from 1920 to 1928, inclusive, stood 10-5-6-7-9-5-10-7-6 respectively, and has shown during those same years a gradual decline in the infant mortality rate save for one year, 1926. Something happened in 1926 in the City which this Committee, after careful study, is unable to solve. but the sudden drop the following year puts the City back in its rightful place.

The accompanying charts will give a much clearer picture of the conditions existing in Poughkeepsie, as well as Beacon, and Dutchess County, than any words this Committee could utter. The figures speak for themselves, and only a few statistics will be quoted here.

In quoting infant mortality rates for Pough-keepsie, nothing was ever done, until 1927, in correcting the rate by including the births in St. Francis Hospital, where the residence of the mother was in the City; and if that is done, which we believe should be, and including the deaths under one year, which occurred under similar conditions, it changes the picture considerably.

Before 1926 the rate was well above 70 each year, and after 1926 with corections made, the rate drops well below 70.

The City of Beacon compares favorably with

\*Including St. Francis Hospital Resident in Poughkeepsie † Totals for Residents of Poughkeepsie.

Poughkeepsie with the peak of its infant mortality rate in 1920, and a gradual lowering except for 1924.

Dutchess County, exclusive of these two cities, is also similarly rated The Infant Mortality Rate in 1920 was 98 with a gradual de-

cline to its lowest of 52 in 1928.

If one other correction is made, that of eliminating 10 deaths occurring in the City of Poughkeepsie in 1929, which do not belong there by reason of residence, and assuming the deaths at St. Francis Hospital properly belonging in the City, also including the birth at St. Francis Hospital belonging to Poughkeepsie, then the infant mortality rate for 1929 in Poughkeepsie is only 60, which, while not as low as should be, is the lowest in 10 years, and shows that improvement is taking place.

Incidentally the Committee wishes to call the attention of the Society that the town of Rhinebeck, which contains two villages, and surrounding rural community, during the past three years, has had 178 live births, and only two deaths under one year of age, and three still births, which is an exceptionally good

record.

An analysis of the causes of death (see chart), in infants less than one year of age in the City of Poughkeepsie, during the years of 1924, 1926, 1928 and 1929, show clearly that prematurity, congenital defects, and birth injuries, contribute thirty per cent and upward of all such deaths, and diseases of respiratory system following, with 10 to 30 per cent. While all of these are not preventable, a large per-

centage of them could be reduced under proper conditions.

Another observation that causes the Committee a great deal of concern is the large number of still births occurring not only in the cities, but the entire county. This is significant, and deserves special consideration.

An examination of infant mortality rates for other countries show that with but three exceptions the rate has been materially decreasing since 1910, in every country of the civilized world, save three, namely Uruguay, Bulgaria,

and Ceylon.

The Committee concurs in the remarks of Miss Dorothy Carter to the Board of Health, that "the circumstances of prevention include a great many things not necessarily in the control of Departments of Health, general living conditions and standards, housing, nationality, education, etc., as well as early and accurate diagnoses by the physicians, and good medical and nursing care, including not only acute bedside care, but also the necessary follow-up instruction and advice."

The vast number of still births and big percentage of deaths from prematurity, congenital defects and birth injuries require more proper pre-natal care and adequate care at time of delivery.

We approve and emphasize the importance of the suggestions made to the Board of Health

by Miss Carter.

- 1. Since the Board of Health maintains a Child Welfare Nursing Service whose specific aim it is to help preserve infant lives, the Board should see to it that that service measures up to the standards set for such a service, and that the nurses employed are qualified to do this important piece of work.
- 2. More emphasis should be placed on prenatal care and supervision both from the nursing and medical standpoint. The nursing pro-

fession feels that it can be of great assistance to the physicians in finding expectant mothers, in referring them to the physicians for care, and in instrucing the mothers during the entire pre-natal period particularly regarding their own care, the preparations for confinement, and the care of the coming baby, many of which things the physician often does not have time to do. But we still find many physicians in the city who are unwilling to have nurses call on their patients for this purpose.

The establishment of pre-natal clinics to facilitate the earlier discovery of the expectant mother and earlier medical examination and

care might very well be considered.

3. The Board of Health should consider the advisability of recommending to the Medical Society that it take up the question not only of the infant mortality, but also the maternal mortality rate with the view of determining what the Medical Society might do as its share in bringing about a reduction of these rates.

4. A general educational campaign among the mothers and fathers throughout the city on the necessity and value of good pre-natal delivery, and post-natal care would undoubtedly

help.

In conclusion, we quote from Dr. Josephine Baker, former director of Child Hygiene of

New York City:

"To be practical is essential. Facts must be faced, and no part of the problem must be left unstudied. But it can and will be solved if we can arouse the public to its importance. Even in the face of insurmountable difficulties we have travelled a long way, and can afford to have that necessary optimism which catches glimpses of ultimate victory over our modern and many-sided Herod."

John A. Card, Chairman, W. A. Krieger, Aaron Sorel

### COMMITTEE ON PHYSICAL THERAPY

The Committee on Physical Therapy of the Medical Society of the State of New York has issued the following statement on "The Pres-

ent Status of Physical Therapy."

The term "physical therapy" comprises the treatment of diseases and injuries by physical agents such as heat, light, massage, exercise, various forms of electrical currents and hydriatic procedures. Physical therapy rightfully forms part of the practice of medicine and should be given the same consideration and study as materia medica and surgery, or any other division of the healing art.

The main advantage of physical measures is that they often enable the physician to give immediate relief to the patient, and that most of the time they are capable of direct application to the affected part. Their use never runs counter to other indicated medical or surgical measures; hence they give best results in the hands of the broadly trained physician who employs all therapeutic measures with an understanding of the underlying pathology.

The previous indifference of part of the medical profession has led to the extended uses of these measures by inadequately trained lay people and there is a growing menace of the development of a physical therapy cult.

Trained lay personnel (nurses or technicians) are useful in administering physical

measures as physicians' assistants in offices, and are indispensable in institutional work, but the initiation and prescription of physical meisures belongs solely to the physician, and he must also be responsible for the proper carrying out of his orders. Physical measures will benefit patients most when administered under the immediate and continuous control of a physician who knows why when and how to apply them. Physicians should not refer their patients to private offices of masseurs gymnasts or licensed physical therapy technicians because of the lack of adequate supervision there.

The general practitioner should be familiar with the theory and the practical use of the principal physical measures. He may possess a reasonable amount of equipment such as (1) a lamp to administer infra red or luminous rays, (2) a lamp to administer ultra violet rays (3) a dirthermy apparatus for the production of penertating heat, and for the removal of superficial growths (4) a small electric vibrator, (5) a galvanic faradic sinusoidal outfit along with the knowledge of hand mas sage and corrective exercise in order to obtain He should know how to mechanical effects use these measures efficiently and safely, this implying adequate previous instruction by physicians and not by a sales agent, and not least, the allotment of proper office space for undisturbed application and for a proper length of time for each patient. A busy physician should not attempt to do much in physical therapy without the aid of a skilled assistant He should not attempt to use these measures on every patient who visits the office, but only when really indicated and where prompt re sults can be expected just as with other meth If unable to institute proper physical therapy, he should refer patients to a competent brother practitioner of to the physical therapy department of his hospital

I playmeal therapy department forms an integral part of every clime or hospital be under complete control of a specially trained physician and shall possess sufficient personnel and equipment to administer treatment in the clinic and it the bedside. About one fifth to one quarter of the patients in a general hospital will be benefited by some form of physical therapy in surgical orthopedic or neurolo gical hospitals about three-quarters of the pretients will require physical therapy physical therapy department should be mainly a reference department like the x-ray depart ment and patients should have the benefit of ill indicited diagnostic procedures before or while they are receiving physical therapy smaller communities, the establishment of a compact department in the local hospital will

best solve the problem of aftording physical therapy to the patients of all physicians, but such a department should never be established on the basis of depending on a trained technician only. It must be actually directed by a specially trained physician who is capable and willing of assuming full responsibility for its proper conduct. Directors of physical therapy departments should be on a salary or should receive the net earnings of the department or at least a substantial part of them

Post graduate training in physical therapy. Short courses under commercial suspices are to be condemned because the main object of most of them is sales propaganda to medical and lay audiences. Those actually wishing to practice physical therapy should take a postgraduate course of at least four weeks duration in a recognized institution. The following approved courses on physical therapy are being offered during the forth coming months.

(1) The Committee on Public Health and Medical Education of the State Society will arrange for a short lecture and demonstration course of four lectures, free of charge, for any County Society The object of this course is to give broad information about the principal measures, their scope and limitation

(2) The Polychnic Medical School and Hos pital of New York offers a four weeks' course, daily, on the theory and practice of physical therapy in all departments of medicine, with four weeks optional additional chinical work, this course is given regularly every two months

(3) Columbia University Extension and School of Medicine offers an eight weeks' course at Montefiore Hospital for chronic diseases in New York, January 17th to March 22nd, two hours a week Columbia University also sponsors other extension courses given at intervals in other institutions (Mt Sinu Hospital, Beekman Street Hospital)

Nurses and other wishing to quality as physical therapy technicians should sepecially be warned against commercial courses on the subject offered by low grade massage schools, these offering training to pupils, often of low est intelligence and education. The course of forced by the Hospital for Ruptured and Crippled, of New York under the auspices of New York University, is the only one at present that is recognized by the University of the State of New York towards requiring a physiotherapy liceuse.

The Committee on Physical Therapy stands ready to answer any inquiries, and offers active cooperation on any problem pertaining to this subject

RICHARD KOVACS Chairman Dec 14 1929

### LEGISLATIVE BULLETIN NO. 1-JANUARY 15, 1930

A number of the bills that we were considering last year have already found their way

into the legislature this year:

Senate Int. No. 17—Fearon, would permit a child welfare board to grant allowance to a mother judicially declared incompetent or insanc. A similar bill last year endeavored to secure an allowance for a mother while incapacitated.

Senate Int. No. 18—Love, would make all disabling diseases and disabling illnesses compensable under the Workmen's Compensation Law. Similar bills have been before the legis-

lature for the last three years.

Senate Int. No. 20—A. J. Kennedy, would amend the Military Law to extend to veterans of any war provisions which are now limited to world war veterans for \$500. Annuity for those permanently and totally disabled by

reason of loss of sight.

Senate Int. No. 32—Mastick, would amend the Workmen's Compensation Law by providing compensation for all diseases arising out of employment. This is a very far-reaching bill, because it would make every employer under whom a workman might have been employed, liable for a share in the compensation allowed the employee if he dies or becomes permanently disabled because of a disease arising out of the employment, unless the earlier employers can prove that the employee was well when he left them.

Senate Int. No. 46—Patrie, legalizes the \$100,000 bond issue of Lewis County for es-

tablishing a general hospital.

Assembly Int. No. 9—Mr. Cuvillier has introduced his health insurance bill very much enlarged this year by adding to it sections on old age pension and maternity benefits.

Assembly Int. No. 44 and No. 45-Mr. Esmond has introduced his chiropractic bills of

two years ago.

Assembly Int. No. 88-Whitcomb, would

amend the Health Law to provide for state aid to counties appropriating money for nurses to care for crippled children. At first glance this bill seems necessary, inasmuch as the law is being interpreted by the Commissioner of Health to cover the expenses of nurses so employed.

Assembly Int. No. 116—Whitcomb, would amend the new Public Welfare Law by providing that a patient whose care is to be a charge on a public welfare district shall be cared for in a hospital located in the city, town or village where patient resides. In Orange County, a joint committee appointed by the Board of Supervisors and the County Medical Society for the purpose of working out the best method of administering the Public Welfare Law, made this one of its recommendations.

Assembly Int. No. 120—Mr. Dominick has reintroduced his bill for sexual sterilization of the insane.

Bills this year will be sent out to the County Chairmen separately, with the Committee's comments attached, and we hope that the Chairmen will cooperate by writing us such comments as occur to them when they receive the bills. Please do this promptly, in order that your Committee may be fully advised as to the position the Society would take with regard to furthering or opposing the proposed legislation. If your comments could be received before Tuesday, the 21st, when the Committee meets, they can then receive its consideration.

Address your communications to the office in Albany, at 100 State Street.

# EDUCATIONAL PROGRAM OF THE WOMAN'S AUXILIARY OF THE AMERICAN MEDICAL ASSOCIATION

The Executive Board of the Woman's Auxiliary of the American Medical Association, at its November meeting, appointed Mrs. (James) Agnes Blake, of Hopkins, Minnesota, as Editor in charge of the educational program of the Auxiliary, consisting of an outline of study of the principles involved in public health work. This outline is of value for any group that studies a public health service, and it is therefore printed in full, as follows:

Fundamental Principles: Fundamentals upon

which the Woman's Auxiliary work for improvement of public hygiene should be based:

(1) Recognition of the fact that public health work is a highly technical job, requiring scientific, technically trained workers. That health work undertaken by lay women with no knowledge of the public health problem as a whole is necessarily fragmentary and ineffective.

(2) Recognition of the fact that every state, county and city is entitled to a scientific full-

time health department, organized not to treat the sick but to prevent disease and promote health, adequately huanced free from political domination, and providing continuity of service to a truned personnel so long as work is efficient.

(3) Recognition of the fact that the first and most fundamental job for lay organizations like the Auxiliary is to secure such scientific full time health departments and adequate health protection, in their state, their county, their

city or town

(4) Recognition of the fact that where effi cient, full time, scientific health departments do not exist (and only about ten per cent of the rural districts of the United States have any thing approaching adequate health protection) health activities must be initiated and carried on by volunteer unofficial agencies, but that all such work should be so planned and admin istered as to serve as stepping-stones toward the full-time official health department, and that when the full time official health department, with workers trained for public health work, has become an accomplished fact, lay organizations should support and cooperate with the official workers and should be willing to take orders from them

(5) Recognition of the fact that no health department—state, county or city—can do effective work without intelligent cooperation of the public, that such public cooperation depends upon wide sprend health education, that lay organizations can do this educational work, and are needed for it, and that the Auxiliary can be one of the most valuable tools for an official health department to use in this work, because it can, by its education of the public concerning the official health department's work and needs be the means of gradually eliminating or preventing political interference with an efficiently working department, and thus insure to it uninterrupted public service

Most volunteer agencies do not yet realize the wastefulness of their individualistic efforts One of the first things the Auxiliary should do is to work for a change of attitude in other vol-

unteer women's organizations

Health officials know that the work which makes the greatest emotional appeal to the public is not always that which most needs to be done. Unfortunately most women do not know this. The doctors' wives might well under take to teach this to other women.

The National Auxiliary recommends, therefore, that each State Auxiliary undertake, under the direction and with the help of the Public Health Committee of the State Medical Association and of its Advisory Council a study

along the following lines:

(1) The fundamental principles of health promotion and disease prevention.

(2) The set up, considered essential by public health experts for in effective state health department, of qualifications of personnel adequate budget and the like.

(3) The state health conditions. It shall device means of acquainting all the state board members with the result and make recommendations for educational work by the county Auxiliaries based upon the conditions found

In states where all is well, and where time has developed good official health machinery and good health conditions, general knowledge of the fact will tend to prevent interruption of the excellent work, and will be a source of satisfaction to the women of the state

In those states where there is much yet to be done, this investigation will indicate what sort of work needs doing first. For example

(a) In those states which are not in the Birth Registration Area, the Auxiliaries would without doubt, wish to tackle as their first job, the miety per cent birth registration problem

(b) In those states in which the state health department believes the "County Health Unit" to be the solution of the rural health problem, the county auxiliaries should be encouraged to take as their chief work such persistent and wide-spread education of the public as will gradually create a general demand for the full time county health department

(c) In those states where the rural health work is directly done "long distance" by the state health department, the county auxiliaries if willing to work and work under the directions of the state health department, can carry on intensive local health education work which would be impossible for the state department without intelligent local cooperation

Outline of Study To those Auxiliaries which agree with these ideas the committee recom

mends the following outline of study

### PUBLIC HYGIENE

(1) Vital Statistics Their value

Compare the vital statistics of the state with those of other states

Compare the vital statistics of the different counties of the state

Compare the vital statistics of the cities with other cities in the state, and in the United States

- (2) The State Health Department, its organization and program
  - (a) For general State work
- (b) For cooperating with the counties in improving county health conditions
- (3) The value of the Public Health Nurse, to the community
- (4) The County Health Unit as a possible solution of the rural health problem

(5) Community-wide conditions which affect health.

(a) Milk:

Milk standards, why necessary, what milk standards your community needs. How are these needs being met?

(b) Housing:

Your community housing laws.

Housing conditions as they have developed under these laws and as they affect health.

(c) General Sanitation and its relation to the death and morbidity rates.

Sewage disposal.

Water.

Garbage.

Flies.

Dust and street cleaning, etc.

### B. PERSONAL HYGIENE

The improvement of personal hygiene in any community is almost entirely a matter of education. Here again the Auxiliary members must first educate themselves before they can

take a safe part in educating the public. The committee therefore recommends that the Auxiliary study programs shall include such subjects as:

Health Promotion:

Prenatal care.

Child Welfare:

Infant and pre-school hygiene.

School hygiene.

Mental hygiene. Social hygiene.

The advantage to the public of general compliance with health regulations.

The periodic health examination. Control of communicable diseases.

The entire program should close with a survey of all the private agencies doing health work in the community, and a discussion of the possibility and desirability of centering the direction of all such work in a full-time, scientific health department, under which the private agencies, while still maintaining their identity, would work in complete cooperation.

### CHAUTAUQUA COUNTY

The Annual Meeting of the Medical Society of the County of Chautauqua was held on Wednesday, December 18th, at Hotel Jamestown, Jamestown, N. Y. Business meeting at 12:30 P.M. was followed by a dinner, the Scientific Session being held immediately after dinner.

The business session was taken up by routine business, and followed by the election of officers for the coming year. The Society moved and unanimously adopted a resolution favoring free choice of physician by injured employes.

The election of officers resulted as follows:

President, Dr. F. J. McCulla, Jamestown; Secretary, Dr. Edgar Bieber, Dunkirk; Treasurer. Dr. F. J. Pfisterer, Dunkirk; Delegates to State Society, Dr. George W. Cottis, Jamestown; Dr. Edgar Bieber, Dunkirk.

Scientific Session following the Business Meeting was taken up by a most interesting and instructive illustrated talk on Pyogenic Infections of the chest, by Dr. Edgar W. Phillips of Rochester, N. Y.

EDGAR BIEBER, Secretary.

### BROOME COUNTY

The first monthly meeting of the year of the Broome County Medical Society was held in the Hotel Arlington, Tuesday evening, January 7, 1930. Interest in the meeting was evidenced by the large attendance of members and visitors, Dr. Conway of the State Department of Health being among the latter.

A very interesting program was given, with Dr. John A. Lichty, Superintendent of the Clifton Springs Sanitarium heading the list by reading a paper on 'The Colon and its Relation to Associated Diseases.' The chief salient point in the paper was his disapproval of the present methods of high colonic irrigations. In

the discussion following, the same feeling was manifested by the vast majority of the members.

A resolution was introduced to the Society by one of its members, Dr. John H. Martin, asking that the Broome County Medical Society give full support to Doctor Grant C. Madill of Ogdensburg, candidate for the medical representative on the Board of Regents of the State of New York. This resolution was accepted and the Secretary was instructed to notify the Senator and Assemblymen of Broome County.

HENRY D. WATSON, Secretary.

#### DUTCHESS-PUTNAM

The adjourned annual meeting of the Dutchess Putnam Medical Society was held on the evening of Mondry, January 13 in the Hudson River State Hospital, Poughkeepsie with Vice-President Dr. C. O. Cheney in the chair, and fifty-five members and three guests present

The following officers were elected for 1930 President Dr Airon Sobel Poughkeepsie Vice President Dr C O Cheney, Pough

keepsie Secretary-Treasurer Dr H P Carpenter

Poughkeepsie

Associate Secretary Dr Gordon Mac

Kenzie, Millbrook, N Y

Delegate for three years Dr C Knight Deyo, Poughkeepsie (1930 1931, 1932), Dr Aaron Sobel, 1930, hold over Dr W A Krie ger, 1931, hold over

Alternate delegate for three years Dr I D LeRoy, Pleasant Valley (1930, 1931 1932) Dr E R Richie 1930, hold over, Dr R H Breed 1931, hold over

Censors Dr. A L Peckham S L Smith

and A W Thomson

membership

Counsel Dr G V L Spratt, Poughkeepsie Dr C E Niles, Hudson River State Hospital, Poughkeepsie N Y, was elected to

The Committee on Public Health and Public Relations, and the Committee on Infant Mortality rendered comprehensive reports Doctor Sadher moved that the Society approve the reports and recommendations as received, that they be printed in the New York State Journal of Medicine, and reprints be obtained for each member with extra copies for the Legislative and Public Health Committees Seconded by Doctor Furlong and carried

Doctor Card moved that the portion of the report dealing with the establishing of a County Health Department be sent to the Board of Supervisors Seconded by Doctor Krieger and carried

Doctor Sadher moved that it is the sense of the Dutchess Putnam Medical Society that we are in favor of the establishment of a County Health Department and that the committee composed of Drs Card Sobel and Krieger be continued to transmit the resolution to the Board of Supervisors. Carried Doctor Sadher moved that it is the sense of the Dutchess Putnam Medical Society that we approve the candidacy of Dr William H Ross of Sulfolk County as Commissioner of Health of the State of New York, and that this be so communicated by telegram to the Governor Unanimously carried

The Secretary's and Treasurer's report was accepted and ordered placed on file

### QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held on October 29, 1929, it 8 30 pm, at the YMCA building, 90th Ave

nue and Parsons Boulevard Jamuer with Dr Lavelle, president, in the chur

The secretary reported for the Comitive Minora

The following physicians were elected to membership: Clyde Nelson Baker, Flushing; Howard J. P. Boylana, Richmond Hill; James Joseph Gleason, Astoria: Carl Krenz, Long Island City; Daniel Lehrman, Jamaica; Aaron Meister, Hollis; Daniel Porte, Jamaica; Charles W. Scheib, Little Neck; James H. Walvoord, Hollis; Joseph C. Watts, Bayside; Alfred Angrist, Queens.

Reports were received from Dr. H. P. Mencken for the Board of Censors: Dr. E. E. Smith for the Committee on Publicity; Dr. Carl Boettiger, for the Committee on Public Health and

Public Relations.

It was voted that the report on health examinations and inspection of laboratories be published in the Bulletin. Dr. Bohr reported for the Committee on Medical Economics, and Dr. Chalmers for the Trustees.

The nominating committee appointed by the chair consisting of Drs. Steiner, Klein, and Stein,

made a report.

Dr. Herrlin spoke relative to Workmen's Compensation and the matter was referred to the Committee on Economics.

Scientific Session:

- 1. Case Report—"A Case of Hydronephrosis in a Lobulated Kidney" by Lester Samuels, M.D.
- 2. Paper—"Sudden Blindness," by Guernsey Frey, M.D. Discussion by Dr. Gainsburgh and closed by Dr. Frey.
- 3. Talk—"The Program of Health Examinations of the Greater New York Committee of the Five County Societies," by Alec N. Thomson, M.D. County of Kings.

Mr. Walsh addressed the meeting on the subject of the Bazaar to be held December 7-14, in the Society Building; which subject was discussed by Drs. Chalmers and F. G. Riley.

Attendance 66.

E. E. SMITH, Secretary.

The annual meeting of the Medical Society of the County of Queens was held in the auditorium of the Y.M.C.A. building, 90th Avenue and Parsons Boulevard, Jamaica, on Tuesday evening. November 26th, 1929, at 8.30 p.m., with I'resident Lavelle in the chair, and 64 members present.

The election of officers, boards and delegates, as published in the October minutes were, on motion duly seconded, unanimously elected as follows:

President—Edward A. Flemming, Richmond

Hill.

Vice-President-Albert L. Voltz, Richmond Hill.

Secretary—Ernest E. Smith, 50 East 41st St., N. Y. C.

Treasurer—James M. Dobbins, Long Island

The following reports were received:

For the Comitia Minora, the Secretary, Dr. E. E. Smith.

For the Treasurer, Dr. James M. Dobbins. The report was referred to Drs. Reuling, Steiner and Neail as an Auditing Committee and upon their report that they had examined the books of the Treasurer and found them correct, the Treasurer's Report was received and ordered on file. Chairman Reuling commended the Treasurer for the excellency of his books.

The Chairman, Dr. T. C. Chalmers, rendered the monthly report for the Trustees. The annual report was submitted for publication by

Dr. Albert L. Voltz.

The Chairman, Dr. H. P. Mencken, reported for the Censors in abstract, and on motion the annual report was ordered published in the Bulletin.

The following, on recommendation of the Censors, were unanimously elected to active membership in the Society:

Nathan Feld, M.D., Richmond Hill. Emanuel Fletcher, M.D., Flushing. Harry Harris, M.D., Astoria.

S. Zachary Vogel, M.D., Kew Gardens.

Walter E. Kiefer, M.D., Room 104, Long Island Station, Jamaica; by transfer from the Medical Society of the County of Northumberland, Penna.

The Chairman, Dr. E. E. Smith reported for the Committee on Publicity.

The report of Chairman, Dr. L. N. Rohr, for the Committee on Medical Economics was ordered published in the Bulletin.

A letter was read from James N. Vander-Veer, M.D., in regard to the appointment of a member of the Board of Regents, whereupon Dr. Chalmers moved that the Medical Society of the County of Queens heartily endorses the candidacy of Dr. Grant C. Madill of Ogdensburg for the appointment on the Board of Regents of the State of New York and that it pledges its wholehearted support to this end. Seconded and unanimously passed.

The following scientific program was presented:

1. Paper—Radiation Treatment of the Female Genitalia. By William P. Healy, M.D.

Discussion by Drs. Mencken, Neail, Flemming, Thomas, Barber, Voltz. Klein, Frey, Hodkin; closed by Dr. Healy. The usual collation was served.

E. E. SMITH, Secretary.

### THE DAILY PRESS

### REDUCING BODY WEIGHT

A balance to the agony of reducing depicted in the accompanying cartoon is the joy and satisfaction implied in the following quotation from the New York Sun of January 20 describing what a prize fighter ate in one evening:—

He had gone to a theater after eating by himself a meal consisting of:

- 3 herrings.
- 4 dill pickles.
- Bread.
- 2 plates of soup.
- 1 double sirloin steak.
- 2 orders of between-acts potatoes.
- 3 cars of corn.
- 2 hottles of beer.
- Pot of coffee.
- Half a pie.

and after the show, which was about three hours later, sat down and ate:

- 3 golden buck rarebits.
- 2 bottles of Schmidt's malt tonic.
- Pot of tea.

When he arrived home (he was staying at my house for the night) we ransacked the icebox and managed to find a half cold roast chicken, several slices of ham, beer and bread. He ate all of it.

Though he is a friend of mine, I am thankful that he does not visit me often, for he sure knows how to cat. In fact, he is known as

"Endicott's Champ Pie Fater." Yet a funny thing about him is that there's not an ounce of fat on him. He's all muscle and his usual weight is about 196 pounds.

The emotional side of "Reducing" as seen by J. N. Ding in the New York Herald Tribune of December 29, 1929.

### A PIONEER IN ANTISEPTICS

A bit of possible medical history is contained in the following abstract from an editorial in the New York Sun of December 7, referring to Dr. Lamartina G. Hardman, Governor of Georgia:—

"On Blackwell's Island (New York) in 1877, he saw the first demonstration of Sir Joseph Lister's spray utilizing carbolic acid as an antiseptic in operations and for wounds. Sir Joseph's discovery of the potentialities of carbolic acid in control of gangrene is commonly fixed as of 1867. Governor Hardman writes that five years before this, in 1862, Dr. L. A. Dugas of Augusta, Georgia, during the war letween the States, used it in the City Hospitals

where gangrene was prevalent. Dr. Dugas obtained the carbolic acid or the tar water from the pine tar, applying it in all these infections and wounds and prevented the spread of gangrene. As a student of medicine, Hardman was taught by Dugas in Augusta Medical College. He declares that Dugas is really the father of antiscptic surgery; that he was the first to suggest laparotomy for gunshot woilinds in the abdomen and the first to use animal ligature—catgut—in the closing of wounds in the intestines, which he did in Wilkes County, Georgia, in 1856 or 1857. This catgut was a violin string taken from a fiddle at a party; the patient recovered."

### SURVIVAL OF THE FITTEST

James J. Montague is a poet, not a scientist; and in his verses in the New York *Herald Tribune* of December 4 he assumes that the dinosaur of ancient days was as healthy as he

"Although he wears a coat of mail The beetle is but weak and frail. But paper thin The rigid skin Which he employs for armor; And yet, though easily destroyed, He's always actively employed On plans to foil The honest toil Of nurseryman and farmer.

A giant was the dinosaur, A hard and horny hide he wore, He had a wreath Of gleaming teeth To masticate his prey with. was big and strong, while beetles were weak and puny. At any rate his conclusions will be interesting to doctors who respect a poet's license.

> He's been extinct time out of mind And never left a thing behind But fossil legs And flinty eggs For scientists to play with.

The dinosaur is not alive;
But beetles multiply and thrive
And daily eat
Good, useful wheat
By methods sly and stealthy.
Though feeble, they outken the ken
Of able scientific men;
So one might say
It doesn't pay
To be too doggone healthy."

### THE RADIO AND QUACKS

Dr. Shirley W. Wynne, Commissioner of Health of New York City, is taking steps to prevent radio broadcasting by quacks. The New York Ilerald Tribune of January 5th states that Dr. Wynne has suggested "a nation-wide survey, of the extent to which medical quacks are using the radio in their advertising." The articlé continues, quoting Dr. Wynne:—

"Such a survey would probably lead to country-wide exclusion of medical fakers by broadcasters on a basis similar to that approved Friday by the broadcasters of New York and its vicinity.

"I am convinced from our own survey and the telegrams received from medical officers all over the country that the problem is a national one. Local broadcasters have shown me that they are ready and willing to clear the air of fakers here, but the range of radio is so great that while this co-operation will protect us for a time, it will not prove a final solution of the problem.

"Our experience with quacks makes me certain that the refusal of local stations to aid them will be followed by a general migration to cities where broadcasters may be found who will accept their advertising. Thereafter we again will be flooded with fake promises and nostrum propaganda.

"It is only fair to our local stations that I make some attempt to bring about voluntary scrutiny of radio advertising on a national scale. I believe that the Federal Trade Commission, the Federal Radio Commission and the United States Public Health Service are bodies of sufficient scope and power to make the necessary survey and to bring the matter to the attention of the entire broadcasting industry for the purpose of securing a voluntary control."

### WHERE DANGER LURKS

The New York Herald Tribune of January 16 has this to say editorially about fatal accidents in one's home:—

"It has been computed that the average New Yorker could spend 1,600 years, eight hours a day, on the city streets without being killed. At home, the fatal accidents would be delayed on the average, for 2,000 years. The automobile probably the most dangerous device which ordinary people habitually use, kills its

average passenger in about 400 years. Among the different kinds of home accidents, but one has been computed, so far as we know, to take account of the average hours of risk. This is the bathtub accident. The data are not precise, but apparently a bathtub is almost as dangerous as an automobile. Otherwise, homes are relatively safe places, as one would expect, instead of relatively dangerous ones in which to stay.

# BOOK REVIEWS

THE AMERICAN ILLUSTRATED MEDICAL DICTIONARY. A Complete Dictionary of the Terms Used in Medicine. Surgery, Dentistry, Pharmacy, Chemistry, Nursing. Veterinary Science, Biology, Medical Biography, etc., with the pronunciation, derivation, and definition. By W. A. NEWMAN DORLAND, A.M., M.D. 15th Edition, revised and enlarged. Octavo of 1427 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1929. Flexible binding, plain \$7.00 net; thumb index, \$7.50 net.

The fifteenth edition of this standard dictionary has undergone thorough revision and is fully abreast of the latest terminology in medicine and the allied sciences. Several thousand new words have been added to the fourteenth edition, many of which appear for the first time in any dictionary. In addition, a number of the older definitions have been improved. A definite standard in spelling, terminology and hyphenization is followed.

FREDERIC DAMRAU.

Tuberculosis: Its Prevention and Home Treatment. A Guide for the Use of Patients. By H. Hyslop Thomson, M.D. Third Edition. 12mo of 99 pages. London and New York, Oxford University Press, 1928. Cloth, 75 cents.

In the third edition of his small handbook, Dr. Hyslop Thomson gives to the public those plans for the prevention of tuberculous disease and the home care of those sick, which have proven of value. It would seem, in this country at least, as if the public had been thoroughly educated on the subject but when some one in a family becomes ill, or is awaiting sanitarium admission, the ignorance of details of home care and prophylaxis is at once apparent.

Into these details the author goes; details of rest, exercise, air supply, nursing, hygiene with care of sputum, quality and quantity of food, symptoms of relapse and the importance of patient, persistent, definite routine. The proper feeding of children from the viewpoint of prophylaxis receives special attention.

A third edition appearing vienteen years after the

A third edition appearing nineteen years after the first is a splendid commendation of the original.

T. A. McG.

PROTOZOOLOGY. A manual for Medical Men. By John Gordon Thomson, M.A., M.B., Ch.B., and Andrew Robertson, M.B., Ch.B. Octavo of 376 pages. illustrated. New York, William Wood & Company, 1929. Cloth, \$11.00.

The authors have been successful in contributing a manual on this important subject that meets the requirements of the medical man of the large cities and of those in the tropics who have common occasion to deal with protozoan disease.

The volume is beautifully illustrated and is presented in a most practical style. Among the subjects described are some of the vegetable organisms and bodies the nature of which is doubtful, such as, for example, Histoplasma, Cryptococcus, Rhinosporium, Chalydoza and Rickettsia.

A section of technique has been included which will be found most useful to the laboratory worker.

H. M. FEINBLATT.

HEFMAN'S DIFFICULT LABOR. A Guide for Students and Practitioners. Seventh Edition, revised by CARLTON OLDFIELD, M.D. (Lond.). F.R.C.S. (Eng.). 12mo of

560 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$5.50.

The seventh edition of this well known book is, like its predecessors, clear, concise and to the point. There is very little lost motion, and the answer to almost any obstetric problem can be found almost at once. The student is told to bring down a leg, after version, by means of a Willett forcep inserted through a small cervicalos. And this in placenta previa, where manual separation of the placenta is advised before the version. Mechanical dilators and laminana tests are still recommended. Willett's forceps to the baby's scalp and a weight over the end of the bed are said to be on trial. The text on difficult labor is very good and well arranged, and on the whole the book deserves the popularity it has enjoyed for thirty-five years.

C. A. G.

RICKETS INCLUDING OSTEOMALACIA AND TETANY. By ALFRED F. HESS, M.D. Octavo of 485 pages, illustrated. Philadelphia, Lea and Febiger, 1929. Cloth, \$5.50.

No better evidence of the great increase in the amount of research and acquisition of knowledge on the subject of rickets, can be thought of than that this one single disease justifies the publication of a book upon it with well over four hundred pages of text. Nobody, either in America or elsewhere, is better qualified to write on this vitally important subject than Dr. Hess. It is largely through his efforts that our present day knowledge of the nature, etiology, and the control of rickets has been developed. Incidently, in this work upon rickets other important advances have been made, some of which are; the development of irradiated ergosterol as a highly potent source of vitamin D, also the irradiation of food-stuffs for use in prevention and cure. There is some tendency on the part of the medical profession at large, and the laity, to be rather indifferent to the repeated statements of investigators, that this disease is universally prevalent in most parts of North America. An especially valuable thing to be remembered is that the second half of the first year of the child's life is the most important time and that when this period corresponds with the fall, winter, and early spring season the danger and probability of the development of rickets are greatly increased. There is no field of medicine in which rickets has not some importance, therefore, it is not only to the children's specialist that a book like this one should appeal, but to all those who wish to keep abreast of the times with regard to what used to be called in Europe "The English Disease" but which might now be better called "The Universal Disease." The study and application of heliotherapy, both natural and artificial, is intimately bound up with the investigations described in this book and would seem well worth reading by any practitioner of medicine who wishes to get a summary of the up-to-date knowledge on this vitally important subject.

WM. HENRY DONNELLY.

PRINCIPLES AND PRACTICES OF ELECTROCARDIOGRAPHY. By CARL J. WIGGERS, M.D. Octavo of 226 pages, illustrated. St. Louis, The C. V. Moshy Company, 1929. Cloth, \$7.50.

The arrangement of the book is in three parts, the first dealing with the general principles of electrocardiography, with the physics of galvanometers and the remainder of the electrocardiographic equipment. The different types of instruments are described.

About a hundred pages are devoted to a full description of the fundamental facts. The second part explains the cause of the normal electrocardiographic deflections and their relation to physical and physiologic processes in the heart, the third section presenting a series of abnormal records which are analyzed.

In discussing the mechanisms of extrasystolic production, bigeminal or coupled rhythms are believed to be most satisfactorily explained by assuming that "owing to abnormal conduction rates or states of block the original impulse is not spent after it has excited the ventricle but re-enters the ventricle at some point which then apparently becomes the focus of a new contrac-

tion."

With regard to the differentiation between auricular pure and impure flutter, the latter often spoken of as coarse fibrillation, the author concisely states that pure flutter is indicated when the auricular rate does not exceed 370 per minute, when the auricular deflections are regular in form, size and especially duration and when a definite relation between auricular and ventricular complexes can be established.

The complexes characteristic of bundle branch block and of arborization or intraventricular block as conceived by Oppenheimer and Rothschild are described. Wilson and Herrmann are inclined to attribute the latter type to incomplete bundle branch block. The author

believes that the differentiation is unsettled.

The book will take its place with the authoritative ones on the subject W. E. McCollon.

THE TREATMENT OF FRACTURES. By LORENZ B HLER M.D. Authorized English translation by M. E. Steinberg, M.S., M.D. Octavo of 185 pages, illustrated. Vienna, Wilhelm Maudrich, 1929. Cloth, \$500.

Similar to most books coming from the pens of continental authors this treatise on fractures has features

foreign to the American reader.

The great number of special splints and devices for the reduction of fractures described by the author have never found favor in this country. fractures under local analgesia, though far from being a closed chapter, has likewise not earned general approval in America.

The clinical part of the book is excellently presented and, though short, is very complete and intensely prac-The illustrations are numerous and well selected. A feature to be deplored is the paucity of roentgenograms, since the accurate reading of skiagrams is an essential part of the training of the modern traumatic

The reflection of a vast fund of knowledge gathered from the treatment of many thousand fracture cases together with numerous practical suggestions make the book a valuable addition to the surgeon's library.

GEO. WEBB.

GONORRHEA AND KINDRED AFFECTIONS. GONORThea in the Male Chancroid and Verruca Acuminata, by George ROBERTSON LIVERMORE, M.D., F.A.C.S., and Gonorrhea in the Female, and the Infectious Granulomata, by EDWARD ARMIN SCHUMANN, A.B., M.D., F.A.C.S. Octavo of 257 pages, illustrated, New York and Lon-don, D. Acaleton & Correction 1998 Cells 1990

don, D. Appleton & Company, 1929. Cloth, \$5.00. This little volume is a brief and extremely practical discussion of a very important subject presented by men who have obviously had very large clinical experience. It should provide an excellent guide to the general practitioner who includes in his practice the

treatment of venereal diseases.

If one were to make any criticism it would be of the multiplicity of suggestions for treatment which makes it rather confusing and difficult to decide the author's own preference. However, it is a book which can be read with profit by anyone interested in this line of work. N.P.R.

OTOSCLEROSIS A Resume of the Literature to July, 1928. Compiled under the Direction of the Committee on Otosclerosis, American Otological Society, Arthur B Duet, M.D., Editor. Two octavo volumes of 684 pages. New York, Paul B. Hoeber, Inc., 1929.

These two volumes can be considered the beginning of a definite research work that a medical society has

As the result of a paper read by Doctor Arthur B. Duel, at the annual meeting of the American Otological Society in June 1924, a Committee of that Society was appointed to collect a permanent fund, the interest of which was to be used by them in research—at first, in otosclerosis, and later in other otologic subjects. That fund has not been entirely raised, but under a grant of \$90,000 made by the Carnegie Corporation, the research in otosclerosis is being carried on.

Otosclerosis, a disease of the ear that is the cause of much of the hardness of hearing in the world, is one of the problems in medicine. Much work has been done to find its cause, but so far that cause remains unknown.

This subject is being attacked, not by independent workers in a haphazard manner, but by workers in all parts of the country considering the same problem from different angles; the results finally to be gathered to-gether by the Committee. As a foundation for their work and their future reports, all the literature published on the subject from 1735 to July 1st, 1928 has been abstracted and presented in these two volumes under the four headings:—Pathology, Etiology, Symptoms and Diagnosis, and Treatment. There are no comments by the author. The abstracts, which are well done, are concise, ample, very easy to read, and arranged chronologically. The index and bibliography are complete.

This is a book primarily for the research worker: but the Otologist who wants to find anything that has been written on the subject, in any language, will find it here.

JOHN W. DURKEE,

MENTAL DEFICIENCY (AMENTIA). By A. F. TREDGOLD, M.D. (Durh.). Fifth Edition. Octavo of 335 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$7.50.

This book first appeared in 1908. Its author speaks from a very rich experience and mature judgment. The subject is discussed from every conceivable angle, and the work is quite encyclopedic in its scope. The problem of mental deficiency is confronting many workers in almost every field of human activity. The physician should be acquainted with the elementary aspects of the subject. Because of its thoroughness and the unbiased and mature judgment of its author, the work is highly recommended. The neuropsychiatrist, will do well to add it to his personal library as work of reference.

IRVING J. SANDS, M.D.

THE COMMON HEAD COLD AND ITS COMPLICATIONS. By WALTER A. WELLS, A.M., M.D., F.A.C.S. 12mo of 225 pages. New York, The Macmillan Company, 1929. Cloth, \$2.75.

New York, The Macmillan Company, 1929.

This book presents in a form especially suited for non-medical readers the present knowledge of the origin and nature of the common cold. The basic facts of the anatomy and physiology of the nose and throat are brought out. Various factors considered important in the etiology are discussed as are the usual methods of treatment. Vaccines are not believed to be of value for prevention or treatment.

# OUR NEIGHBORS

### A LEGISLATOR'S OPINION IN NEW JERSEY

The Journal of the Medical Society of New Jersey for December contains the stenographic report of a special meeting of the Welfare Committee of the Society called for the purpose of hearing a Senator of the Legislature present his views concerning the Medical Practice Act of New Jersey. The Senator, who had a personal interest in a naturopath called Mr. Heinze, is reported as saying:

"Heinze(?) is a radical but he is and I believe he has a very good knowledge of the subjects embraced in what he is trying to practice. He is a naturopath and has made a study of electrotherapeutics, and massage, and treatments of that kind. At the present time he is practicing illegally. Might it not be possible to have an examination given to some of these people who have studied and extended their work? If, as a result of that examination, these men are found qualified to carry on that work and they are allowed to practice their particular lines, they will become good citizens and will be a help to you and your Board. Those who cannot pass such examinations should be chased out of the state. I have no idea of providing for a separate Board or giving them special privileges, except to submit them to this test by your own Board.

"Some of the doctors ask me whether I would think of admitting to the practice of law any one who had not graduated from a law school. My answer is that we require that a man must have actual experience of practice in a law office and then pass an examination before the Bar Association. I believe some of these men practicing medicine without having passed all the college tests are doing some good and I think the public feels that they are being persecuted when their practice is interfered You must remember that every time one of these men is prosecuted he has 50 or more friends who feel that it is persecution. Elmer Long said to me the other day that while he realized some of these naturopaths are not practicing within the law, he thought some of them might be doing good work. Why is it that they cannot be admitted to practice in a limited way? I believe it would be a step in the right direction to give these people the privilege of taking a special examination. I would have them admitted to practice legally and then put them under control of the state. If you can see your way to recommend such a change in the law it would not harm you and

it would be appreciated by the public. haps it might be done as in Pennsylvania, I believe, where physiotherapists are required to practice in association with a legally registered

physician.

"I am not representing a group of chiropractors or naturopaths. I came into this matter because of friendship for this one man. I defended him years ago when the osteopathic Board prosecuted him, and I got him off. He is not bitter about the matter but wants a chance to show that he is capable of doing what he claims ability to do. I have refused to take other cases of the kind and I am not interested financially in defending this man.

Dr. Green: "I would like to ask the Senator two questions: First, does he wish to extend his proposition to include letting down the bars also to those taking the examination to practice medicine proper-young men perhaps who have a medical degree, obtained from a second or third rate college? Second, how long does he propose to leave the bars down for the naturo-

paths?"

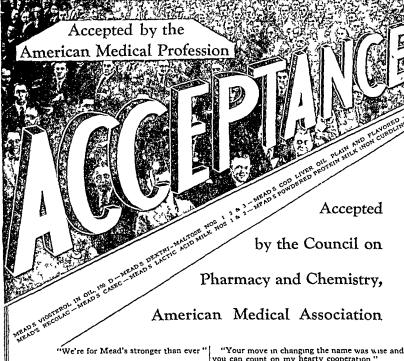

Senator: "I have no desire to lower the bars at all, and interfere with the structure of the present law but just in the case of men who have practiced 10 years or more, to inquire into what they have been doing, and to examine them in the particular branches of medicine they practice. It is my idea that they should come before the present State Board of regular Medical Examiners. The present legal requirements are not too high for the future but they are too high for some of the men who have been practicing for 10 years past and who have probably gained in knowledge by their own study and experience. You could ascertain their fitness by giving them a special examination, preferably an oral examination that would soon determine their capabilities. Heinze (?) was interested in electrotherapeutics even before he took the chiropractic examination and he has continued to study in that direction."

The Senator was asked: "Just what are you going to do with the 500 or more unqualified applicants that want to come in? Would you admit them without examination?"

The reply was: "No. Give them an educational test on the basis of requirements at the time they graduated—say in 1921."

The Senator agreed to draft a bill and submit it to the Secretary of the Committee.

# Vomiting of Pregnancy

THIS condition, so common in obstetrical practice, not infrequently assumes a serious aspect by impairing the nutrition. It has been found, however, that many patients can be carried through the early months of pregnancy with but slight loss of weight and strength by the use of

### LUMINAL-SODIUM

"Luminal" Trademark Reg U S. Pat. Off. and Canada

Brand of PHENOBARBITAL-SODIUM

In cases of moderate severity, Luminal-Sodium may be given by mouth in doses of 1½ grains an hour before meals and, if necessary, at bedtime. After four or five days, the frequency of administration is reduced.

When nothing is retained by way of the stomach, Luminal-Sodium is given hypodermically in amounts of 2 grains three or four times daily. For this purpose, ampules containing 2 grains of the sterile powder are available. A solution is readily prepared in the ampule by adding 1 cc. of distilled water.

How Supplied: For oral use only, 1½ grain tablets in bottles of 50. For injection, ampules of 2 grains in boxes of 5.

# MEDICAL LEADERSHIP IN KENTUCKY

The Kentucky State Medical Association has an officer called the Orator in Surgery, and another called the Orator in Medicine. The Oration in Medicine delivered before the State Meeting on October 21, 1929, was by Dr. E. L. Gowdy, of Campbellsville, whose address is printed in the December Kentucky Medical Journal, the closing paragraph of which reads:

"County hospitals and community health centers all over the state are consummations we are devoutly wishing for. They are coming, but if they are to be real health centers and not mere invalid hotels and repair shops, we are going to have to have general practitioners to carry out the premier rôle in the forwarding of the scheme. In Kentucky, our health departments are controlled by the medical profession, and, if they are successful, they should be so conducted that the public will be taught the necessity and usefulness of individual ministrations of the general practitioner in medicine. Where are they coming from, these general practitioners of the near future? Cannot all of us slip a kindly word to some young man about to begin the study of medicine about this wonderful field where the harvest will be great and the laborers few? I desire to close this address with an appeal to the medical profession of Kentucky to assert its leadership so as to preserve for the public the general practitioner, that keystone in the arch of scientific medicine, and place him on that pedestal in the hearts of the people he formerly occupied."

# PUBLIC RELATIONS COMMITTEE IN MAINE

The December issue of the Journal of the Maine Medical Association contains the following account of the November meeting of the Penobscot County Medical Society:

"The annual meeting and dinner of the Penobscot County Medical Society was held at the Bangor House, November, 1929. Dr. H. E. Thompson, retiring President, presided, and delivered an interesting paper on 'Leucocytes,' illustrated by charts and drawings.

"Through the courtesy of the Metropolitan Life Insurance Company an interesting moving picture reel was exhibited entitled 'Diphtheria.' A plan is on foot to secure the protection of the children of Bangor, by immunization, against this dread disease, the Insurance Company undertaking to finance the cost of all immunizing material.

"Dr. Cook, of Newport, was elected President, and Dr. Scribner, of Bangor, retained as Secretary for 1930."

### SERVICES OF STATE MEDICAL SOCIETIES

The following résumé of what the State Medical Society does for the doctor is contained in Minnesota Medicine of January:

"1. Publishes the scientific journal Minnesota Medicine.

"2. Creates a fraternal feeling among physicians and enables them to cooperate with each other in local and state matters.

"3. Studies constantly the many changes that are taking place in scientific and economic medicine through the many activities of the

committees.

"4. Notifies members of current events that effect the profession through Minnesota Medicine, and also sends special communications of unusual, legal, and legislative occurrences.

"5. Conducts graduate courses covering the

newer aspects of medical practice.

"6. Proposes state legislation in the interests of scientific medicine and the public health. It has also been instrumental in defeating many measures which have been proposed to the

detriment of scientific medicine and public health.

"7. Assists local societies in presenting programs of interest and in securing speakers.

"8. Enables its members to secure malprac-

tice insurance at a reduced rate.

"9. Conducts an Annual Meeting to which the best medical men in the state and county bring the results of their latest experience and research.

"10. Furnishes the members, prompt and confidential information on any subject relating to the practice of medicine through the Con-

sultation Bureau.

"11. Sends our Legislators Hygeia and Everybody's Health in order that they may be properly informed on matters of health.

"12. Maintains a Speakers Lay Library containing material on subjects suitable to laymen and loans the material to the doctors upon request.

"13. Sends weekly health stories to two hundred and sixty rural newspapers."

# This is the merger age-

Consolidation and combination are the twin screws of modern business methods. Therapeutic practice has long endorsed the use of synergistic medication. Combination of Lubricant, Laxative and Antacid action assures successful results.

# Magnesia-Mineral Oil (25)

# Doctor— Why Ask a Patient to Decide?

There are many good brands of Cod Liver Oil on the market, but there are also many commercial, untested and inferior oils. Is it fair to your patient to merely suggest that he get some Cod Liver Oil and leave the decision of which kind to him or to chance?

Aren't you putting him in a position where he must rely upon a clerk's recommendation (rather than yours) or else decide for himself from the

slightest of knowledge or none at all!

When you recommend or prescribe Nason's by name you remove all uncertainty from the patient's mind and add to the virtues of the Cod Liver Oil itself, the effectiveness of your authority and knowledge.

Your patient is not likely to know of Nason's except through you as this pure, pleasantly flavored and vitamin-potent Cod Liver Oil is advertised

only to the profession.

# High Vitamin Potency Plus + Palatability

The vitamin potency of Nason's Palatable Norwegian Cod Liver Oil is warranted to be not less than 800 vitamin A units per gram and not less than 100 vitamin D units per gram. Each lot is biologically tested.

Accepted by Council on Pharmacy and Chemistry A. M. A.

# POPULAR HEALTH EDUCATION IN ILLINOIS

The Illinois State Medical Society conducts popular medical education along several standard lines which are described in the *Illinois Medical Journal* for January. The report of the educational committee of work done during the last four months of 1929 gives the following items:

four months of 1929 gives the following items: "Speakers' Bureau: Forty thousand people attended 143 meetings where subjects relating to 'good health' were discussed by speakers scheduled through the office of the Educational Committee. Special assistance was given to organizations sponsoring public or community meetings. Speakers were furnished by the Committee for fifteen community meetings in one county where a diphtheria immunization campaign was being conducted.

"Radio: Thirty-four health education talks have been given over radio stations WGN and WJJD. Copies of these talks covering thirty-three subjects are on file in the office of the Committee, among them being, High Blood Pressure; What the Public Should Know About Gastric Ulcers; Nervousness, and Pre-

natal Care.

"Scientific Service: Thirty-six physicians presented scientific papers before twenty-one county medical societies, on twenty-five subjects, ranging from gastro-intestinal diseases to

endocrine factors in common colds.

"Dr. Camp has sent to all county secretaries a list of physicians who have agreed to assist the Scientific Service Committee and the subjects they have consented to present to medical societies of Illinois. The Educational Committee has assisted some counties in securing better attendance. Seven hundred and twenty-five news items announcing meetings of these societies have been released to newspapers in Illinois, Indiana, Missouri, and Iowa.

"Press Service: 2,652 news articles were released to newspapers during the months of September, October, November and December. This number included notices of special meetings, the regular meetings of the Chicago Medical Society and its Branches, and the health educational column which is now supplied to

about one hundred papers in Illinois.

"Fifty-six educational articles have been written about such subjects as sore throat, that first cold, thumb-sucking, worms in children, the oys-

ter season, and frost bite.

"More than 5,000 clippings were received and filed in the office of the Committee. Physicians of Illinois are invited to make use of these files where information on almost every health topic may be found. One hundred and eighty-five package libraries have been sent out to speakers. Films have been secured for (Continued on page 183—Adv. xxiii)

(Continued from page 182-adv xxu)

la) groups and physicians I hese were loaned by the State Department of Public Health, the American Society for the Control of Cincer, and the Metropolitan Life Insurance Company The Committee will gladly order films or other illustrative health inaterial for the use of schools or clubs.

The Committee has outlined a program for cooperation with the Chicago Woman's Club in the matter of education of the public to the cirly danger signals of cancer Cooperation is also being given the Chicago Council of Jewish Women in furnishing speakers to give talks on cancer before the eighty one clubs in the Council and in scheduling speakers to give talks before mothers of school children in certain sections of the city. Through this Council the Committee is also furnishing health plays, songs, films, etc., to these schools

Material is also being collected for some of the Women's Auxiliaries who are forming groups to study questions of particular interest to the medical profession

The Commuttee has also assisted one county in paving the way for the establishment of a county health organization as outlined by the Child Hygiene Advisory Council of the State Department of Public Health"

# PHILLIPS Milk of Magnesia

# Tycos Recording Sphygmomanometer

Perfected to eliminate error due to the personal equation in blood pressure technique. The reading, permanently recorded on a chart, gives systolic and diastolic pressures, and also rhythm and amplitude. Your surgical supply dealer will glidly demonstrate this instrument or write for particulars.

# PUBLIC HEALTH EDUCATION IN MINNESOTA

The January issue of Minnesota Medicine contains the following report of the Public Relations Committee of the St. Louis County

Medical Society:

"The Public Relations Committee is completing its second year. During this short period it has developed into a committee with more demands on it for service than any other in the society. This has been brought about in spite of the fact that no aggressive attitude has been taken, but rather the committee has stood ready to render service whenever called upon. This proves conclusively that up to two years ago we were passing a golden opportunity to sell a modern scientific medium to the public. No one will dispute the fact that information given to the public, through talks and other methods, promotes better health and more happiness. With less preventable diseases, there will be more efficiency and greater production with the general benefit to the whole community. Looking at it from a selfish point of view, it gives us an opportunity to create a greater demand for medical services. Scientific Medicine has much to offer and nothing to hide. Having goods of merit, the better the public is acquainted with, the greater will be the demand for them. We have so many

lines that have hardly been touched, the foremost, perhaps, being periodical health examinations.

"About one hundred talks have been given to groups and organizations during the past year. Nearly sixty were given during health week last winter. Material was furnished for the 'Annual Baby Section' of one of our daily papers, which provoked a very complimentary editorial for us. Speakers have been provided for the 'Sixth Industrial Safety School' which was conducted by the Chamber of Commerce last month. The audience consisted of seven to eight hundred foremen and superintendents from Duluth and surrounding towns, who in turn take the message home to the men working under them; and so, ultimately, we will reach many thousands.

"Work with the newspapers has been rather discouraging. Material presented to them is so badly revamped, it is almost impossible to recognize it in print. Their attitude is changing and they are now calling for material more often; and so it is hoped that before long they will be less suspicious that we are looking for free advertising and will be more willing to co-

operate."

# In pneumonia Start treatment early

In the

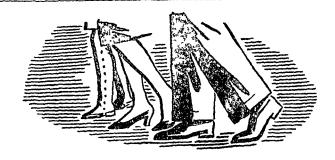

# Optochin Base

treatment of pneumonia every hour lost in beginning treatment is to the disadvantage of the patient. Valuable time may often be saved if the physician will carry a small vial of **Optochin Base** (powder or tablets) in his bag and thus be prepared to begin treatment immediately upon diagnosis.

Rahway, N. J.

# Who is your Patient?

MAN or woman? Adult or child? A very necessary question when you prescribe a remedy for constipation—unless it is Agarol the original mineral oil and agar-agar emulsion with phenolphthalein. Then you need to give thought only to the dose. And that is simple. Begin with a tablespoonful for adults and a teaspoonful for children, at bedtime. Reduce the dose as improvement takes place.

No excess of mineral oil to make adjustments of the dose necessary. An emulsion as fine as it can be made that mixes thoroughly with the intestinal contents, carries unabsorbable moisture to them and makes evacuation casy and painless.

Besides, it gently stimulates peristalsis, and thereby makes the result certain and reeducation of the bowel function possible.

One tablespoonful at bedtime

—is the dose

I mal decision on the true worth of Agarol cests with the physician. We will gladly send a twin package, withliterature, fortrial.

AGAROL for Constipation

WILLIAM R. WARNER & COMPANY, Inc. :- 113 West 18th Street, New York City

### MEDICAL PUBLICITY IN TEXAS

The State Medical Association of Texas has promoted medical publicity by means of paid advertisements inserted in newspapers by county medical societies, as described in the December, 1929, issue of the *Texas State Journal*. The issue of December, 1929, quotes the following editorial from the Vernon Record, approving the medical publicity of the State Society:

"There can be no doubt that medical men owe it to themselves to let the world know what they are doing. This is an age of frankness and openness, not one of secrecy. Publicity has created public interest that has made for improvement in almost every human activity. It is really surprising that a group of people as intelligent as medical men must be in order to maintain their standing in their profession still subscribe to a

policy of an almost forgotten age.

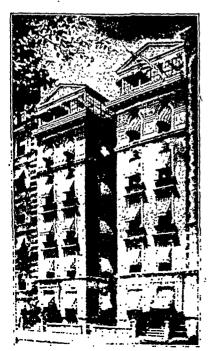

"The Record does not view the matter from the point of the individual physician, but from that of the public. Orthodox medicine owes it to the public to keep it informed as to its capabilities for preventing and curing diseases. Newspapers of today are overburdened with advertisements of certain cures for almost every disease imaginable. The makers of these so-called cures are getting rich because there are thousands of people anxiously looking for something that will

alleviate pain or suffering of some sort, and they are ignorant of what to do. It is grossly misjudging the people to conclude that each person that buys a so-called cure is illiterate and actually expecting the medicine to do all that the advertisement said it would.

"Obviously the medical profession could render the person in that state of mind a great service by publishing reliable information from time to time. The medical profession is obligated to serve humanity, and the public distinctly needs a service of this type. Advertising, or publicity, as it may be, is educative. Through advertising the public has been taught to adopt higher living standards, and now confidently expects to be kept informed of new developments through the medium of advertising. Higher health standards could be taught in the same way. They should be. It would mean improved health conditions and would result in a great saving to the public annually by reducing graft of the producer of widely-heralded panaceas that are really worthless.

"Perhaps it would be more practical for the medical men to advertise in groups, representing associations. That could be worked out among themselves. The fundamental fact is the public needs to know more about the medical profession.

# For Alcoholism and Drug Addiction

Provides a definite elimination treatment which obliterates craving for alcohol and drugs, including the various groups of hypnotics and sedatives.

Physicians are invited to be in attendance on their patients. Complete bedside histories are kept.

Department of physical therapy and well equipped gymnasium. Located directly across from Central Park in one of New York's best residential sections.

# The Silencer Effect

HE one function of a cough syrup is to stop, as quickly as possible, the barking, racking, hacking paroxysm, while, by other methods, you are relieving the cold.

And this function Thiate performs perfectly. It is a synergistic combination—a new idea, in which with Potassium Guaiacol Sulphonate are combined Benzocaine Benzoate, Sodium Mono-Benzyl Succinate, and Sodium Salicylate.

It is easy to prove if a cough syrup really performs. The silencer effect really tells the story, and one trial of Thiate is sufficient. For that trial we will send you a bottle, free of charge. A request brings it.

### GOLD RADON IMPLANTS

Removable gold radon implants are now available to the Medical profession. Unlike the gold implants previously procurable these are under permanent seal so that there is no possibility of leakage of radon. Moreover they are fashioned in such a way that the ends are perfectly smooth-no rough and jagged edges to traumatize the tissues or cause irritation in those cases where it is decided to leave them permanently in position. Inasmuch as irritation is regarded as one of the most potent predisposing factors to the establishment of malignancy, the avoidance of any form of treatment which has even a remote possibility of inducing it, is of paramount importance in preventing recurrence. With such a means of application the uses of radon can now be greatly extended. The implantation method is steadily supplanting other forms of administration, inasmuch as it is adaptable to a multitude of situations where no other form of application is possible. Screened with 0.3 or 0.4 mm. of gold, practically all caustic action by Beta radiation is eliminated, while the deep penetrating, short-length gamma radiation-upon which the radium therapist depends to produce results-is unimpeded.

Radium, in the convenient adaptable form of radon implants, can no longer be regarded as a "last resort"-to be employed when surgery and all other methods prove futile or impossible. It is now used alone in many situations where surgery a few years ago would have been deemed the only effective method, and even where surgery is still the main reliance, the wisdom of bringing in radium implantation as a postoperative auxiliary, is acknowledged on all sides. In the form at present available the field of its usefulness seems likely to be indefinitely extended, an the entire science of radium therapy has received a new impetus which will place it on a par with any other therapeutic methods now known to medicine. See back cover .-- Adv.

### A PHYSIOLOGICAL REMEDY FOR CONSTIPATION

The modern treatment of constipation aims to relieve atony by increasing the bulk of the intestinal contents. To this end, numerous indigestible substances capable of absorbing water and swelling in the intestinal tract have been tried.

A new physiomedical remedy for constipation-Normacol-possesses to a marked degree the valuable property of absorptive capacity.

Volume for volume, Normacol has a swelling capacity several times greater than that of psyllium seed or agar agar. Another advantage is that it swells most in the alkaline medium of the intestines, where this action is desirable, and least in the acidity of the stomach, where it would be less desirable.

This increased volume stimulates peristalsis and consists of coated granules of bassorin sap reinforced by onefifth the U.S.P. dose of cascara sagrada. When in contact with water, it swells to approximately 25 times its original bulk, supplying the volume needed to stimulate peristalsis.

The usual dose is 1 to 2 teaspoonfuls taken dry on the tongue and followed by a drink of water, once or twice a day after meals. Unlike most laxatives, Normacol does not lose its effectiveness on continued medication. No increase of dosage is required.

Normacol is supplied in packages containing 100 and 200 Gm. respectively. It is the product of the Schering Corporation, 110 William Street, New York City, who will send samples to physicians on request. See page viii.—Adv.

### MAGNESIA

Among the simple remedies of the present day that have been used for centuries and have stood the test of time and experience is Magnesia.

"Magnesia" was originally a general

had the power of attracting some principal from the air, from Magnes, th. Loadstone. It was first used as a medicine in the beginning of the seventeenth century by a Roman Ecclesiastic, under the title Magnesia Alba or Count Palma's Powder. The mode of preparation was kept secret until 1707, when Professor Valentine of Giesen pointed out how this substance could be prepared. At present, the term Magnesia is restricted to Magnesium Oxide-MgO-(Burnt or Calcined Magnesia). For many years Magnesia and Mag-nesia Alba (Magnesium Carbonate) were used only in their solid forms.

About half a century ago, Mr. Chas. H. Phillips, a New York Chemist, invented a Concentrated Liquid Magnesia under the title "MILK OF MAG-NESIA", which has received the unqualified support of the best practitioners. This liquid preparation possesses all the medicinal properties of the solid forms of Magnesia without their disadvantages and objectionable features, and is the most convenient and dependable form in which Magnesia can be used. See page xxi.-Adv.

### BELLAFOLINE "SANDOZ"

contains in pure form all the therapeutic principles of belladonna leaves and is more constant and more stable than belladonna tincture, a preparation often lacking in dependability. Bellafoline is twice as active as atropine in doses of equal toxicity and is, therefore, more suitable for long continued treatment so often necessary in cases requiring belladonna or atropine therapy. It has no narcotic effect and acts solely by moderating vagus functions and not through general depression of the nervous system. Its indications are those of belladonna generally: vagotonies, spasm, hypersecretion.

Bellafoline "Sandoz" is marketed in tablets and solution for oral use (dose: 1-2 tablets, or X-XX drops solution. 3 times daily), and in ampules for subcutaneous use (dose: 0.5-2 cc. per day). -See page xiii.-Adv.

## CASCARA EVACUANT (PARKE. DAVIS & CO.)

Cascara Evacuant, Parke, Davis & Co., represents genuine Cascara Sagrada bark (Rhamnus Purshiana) from which the bitter constituents have been removed (not merely neutralized) by a special process which does not weaken the activity of the remaining constitu-

Cascara Evacuant, a tonic laxative, is prescribed by physicians in the treatment of all forms of constipation. Best administered just as it comes from the term, expressive of any substance which bottle, without dilution with water.

Small doses of 10 to 15 minims three times a day are recommended; the treatment should be continued until the desired tonic action on the intestinal tract has been produced, when the dose should be gradually reduced and the Evacuant finally withdrawn.—See page XXXV.—Adv.

### LILLY'S EPHEDRINE INHA-LANT

Of the 130,000,000 cases of disabling illness that occur in the United States each year, the chief offender is the common cold. Men are said to be down once on an average, women twice, and children more than twice.

The great spread of such easily commitmented diseases as respiratory infections is in no small measure due to the prevalence of ambulatory cases and to careless personal hygiene. Since there is no specific preventive, relief is next in order and to date physicians have at their command no agent more useful for alleviating the highly uncomfortable feeling produced by a "head cold" than ephedrine in topical applications.

Intranasal applications of Lilly's Inhalant Compound No. 20 have used with marked satisfaction. Item undoubtedly leads all other Ephadrine Products in nopularity with physicians. Occasionally an inhalant with milder aromatic properties is indicated and Lilly's Ephedrine Inhalant Plain, No. 21, will then be found highly satisfactory. Both of these items contain one percent of ephedrine. Eli Lilly and Company also make available a three percent solution which is in large demand, we are informed. This item is occasionally very helpful when diluted with equal parts of normal salt solution and used as a spray.

A comparatively new vehicle for ephedrine has recently been introduced by Eli Lilly and Company in the form of a water-soluble base containing ephedrine sulphate one percent. It is especially useful in treating children, being non-greasy and requiring no atomizer or equipment of any kind.—See page xiv.—Adv.

### RADON

Radon, the source of the therapeutic plants, These implants being pure gold tubes of approximately five millimeters length and seventy-five hundredths of a millimeter in diameter. The wall thickness of 0.3 millimeters of gold absorbs 99.6% of the beta rays.

Radon implants screened with 0.3 millimeters of gold reduce the intensity of the inflammatory reaction and the area of complete necrosis. The emitted radiation from 0.3 millimeter wall gold implant is 8.8% beta and 91.2% gamma, whereas from a glass implant, 96.5% of the emitted radiation is beta and 3.5% gamma.

Radon, a surgical agent, should be

available in sufficient quantities when operations are performed on malignant tumors. Radon implants, inserted into the remaining tumor tissue at the time of operation, extend the attack on the malignant disease.

Radon is particularly adaptable in the treatment of tumors in body cavities and in localized tumor areas. It may be applied at varying distance from the tumor, or implanted.—See page xxxv.—Adv.

### FELLOWS' SYRUP

An attack of Grippe, however slight, may have serious consequences. It is a depressing illness of the first order. Convalescence is slow and the difficulty of the organs in recovering their equilibrium, exposes the patient to secondary infections, or functional diseases.

It is important, therefore, to promptly raise the "Nervous Tone" of a patient convalescing from Grippe.

The Salts of Iron, Sodium, Potassium and Manganese which are the principal elements of the Nervous Tissues are combined in scientific proportions in FELLOWS SYRUP, to meet the requirements of the Cerebro Meduar centres. Furthermore, these mineral foods are associated with dynamic agents, which restore the energy of a weakened organism.

This explains the durable effects of FELLOWS' SYRUP and the regularity with which they are obtained in cases of nervous depression. See page xvii.—Adv.

### TYCOS SURGICAL UNIT

For Blood Pressure Determination in the Operating Room

For the convenience of anaesthetists and surgeons, who are finding that accurate blood pressure readings are invaluable during anaesthesia and surgery, we lawe designed this Tycos Surgical Unit.

It consists of a large easy reading type Tycor Sphygmomanometer and a universal clamp. The clamp enables the Sphygmomanometer to be adjusted to any position convenient for the anaesthetist and out of the way of the surgeons and assistants. The adjustments can be made instantly, but once made the instrument is firm as the table itself. It it is inconvenient to have the instrument attached to the table, the clamp will accommodate it to the anaesthesia equipment or instrument stand.

Modern trends make it extremely important for hospitals to include the Tycos Surgical Unit in their operating room equipment.

Your dealer can supply you with this equipment. Complete unit \$52.50. Clamp only \$15.00. Write today for additional information, See page xxiii.—

### THE BACTERIOLOGY OF IN-FANT DIET MATERIALS

It is not generally realized, the extent to which Mead Johnson & Company carry their research.

Efficient and systematic as are the research activities carried on for years in their own laboratories, this progressive house is constantly adding fellowships at leading universities and other institutions.

One of these has recently corroborated\* a fact of great importance to all who feed infants: No Mead Product contains hemolytic streptococci or other pathogenic bacteria.

The significance to pediatricians of this brief statement lies in the fact that the presence of hemolytic streptococcus has been suspected in infant diet products, its relationship to scarlet fever, septic sore throat, enteritis, etc., naturally being a source of alarm.

It is reassuring to all physicians to know that not only have Mead Products never been under suspicion but that from authoritative unbiased sources comes additional proof that as a result of careful technic and long experience, Mead Products are bacteriologically clean and safe to prescribe: Dextri-Maltose, Recolac, Casec, Lactie Acid Milk, Powdered Protein Milk.

\*New York State Agricultural Experiment Station Bulletins Nos. 153 and 154.—See page xv.—Adv.

### DIGITALIS SUPPOSITORIES

Digitalis Suppositories are of value in the advanced stages of myocardial insufficiency, after surgical operations, and in the treatment of Pneumonia. The rectal administration is a valuable and efficient method of Digitalis The absorption of Digitalis through the rectum proceeds at the same rate as when the drug is administered by mouth and the total dosage required for digitalization is identical with the amount required when the drug is given by mouth. The Rectal Suppositories are manufactured by the LEDERLE ANTITOXIN LAB-ORATORIES who will be very glad indeed to give you detailed information regarding them .- See page vii .- Adv.

### KALAK WATER

Many, diseases are complicated by an "acidosis." An important part in their treatment consists in replacing those elements needed to maintain the alkali

In clinical practice a rational and agreeable method of alkalinization is afforded in Kalak Water.—See page in Adv.

# ... NEW/

# NON-LEAKABLE Gold Radon Implant

A Decided Forward Step in Radium Therapy

Radium therapists will instantly recognize the advantages of this new Gold Radon Implant<sup>†</sup>.

No longer need there be uncertainty as to the loss of radon through leakage. The new Gold Radon Implant is hermetically sealed. Certified concentration is now assured.

The serious objection to the irritating effect of sharp and ragged edged implants is now completely overcome. With perfectly hemispherical ends, highly polished, the *new* Gold Radon Implant can be passed through the implanting instrument without difficulty, and will not cause irritation to implanted tissue.

Every implant is uniform in dimensions, and has these physical characteristics: outside diameter 0.9 millimeter; length 4 millimeters; wall thickness 0.3 millimeter instead of the usual 0.2 millimeter. All implants are made from 24 karat gold. Absorption of Beta rays 97.6% as against 91.5% for 0.2 millimeter gold formerly used.

We furnish the new Gold Radon Implant in two types—permanent or removable. Removable implants can be withdrawn from tissue immediately treatment is concluded.

You may enjoy these added advantages at no increase in price.

Implanting instruments will be loaned without charge.

Quick deliveries to all parts of the United States or Canada.

Wire, write or telephone your orders.

# Proofs of the Permanency of Vita\* Glass

[Presented in the belief that this product affords a public health benefit of the highest importance, and merits the serious study of the medical profession]

The therapeutic benefits of natural ultra-violet light are today universally accepted.

The fact that ordinary window glass does not transmit the vital ultra-violet rays of sunlight is universally acknowledged.

Scientific tests have established that windows of Vita glass transmit a constantly effective volume of the vital ultra-violet light.

In discussing this new glass with your patients you will from time to time come across two entirely baseless rumors now extant in the New York area. The first is that Vita glass "wears out"—that its effective power diminishes with time. The second is that winter rays, or rays in smoky cities, are not effective.

Both rumors are groundless: both are based on misinterpretation of scientific data. Vita glass is being marketed only after exhaustive tests have established the permanency of its life and values.

Such tests are those of Professor Walter H. Eddy, Professor of Physiological Chemistry, Teachers' College, Columbia University, conducted in New York City for the past two years in the severest of winter months.

"In 1929", writes Dr. Eddy, "using a glass two years old, we not only obtained protection between February 16th and March 16th, but we also proved that three to four bours exposure was equivalent to a full 24-bour exposure in protective value."

"I am convinced by these experiments that the installation of Vita glass windows in New York City insures the utilization of rays of real health value even in winter", Dr. Eddy concludes.

The Eddy experiments confirm anew results obtained with winter sunlight and Vita glass by the Council on Physical Therapy of the American Medical Association, Post Graduate Hospital, New York, U. S. Army Medical Corps, Washington, and other individuals and groups. Full details of these tests will be mailed you on request.

Substantiated by four and one-half years of actual use throughout the world, and by exhaustive accelerated tests by leading scientists and physicists through exposure to both intensive sunshine and artificial light, and by controlled biological tests made with solarized and stabilized glass, Vita glass is sold subject to the following guarantee:

THE PROPERTIES OF VITA GLASS ARE PERMANENT. AFTER A SHORT STABILIZATION PERIOD IT IS GUARANTEED TO TRANSMIT AN EFFECTIVE VOLUME AND COMBINATION OF RAYS OF VITAL ULTRA-VIOLET LIGHT PERMANENTLY.

# THE TREATMENT OF MENTAL DISEASES IN A GENERAL HOSPITAL\* By THOMAS J. HELDT, M.D.

From Division of Neuropsychiatry, Dept. of Medicine, Henry Ford Hospital, Detroit, Mich.

A S a constituent unit of the United States, New York state has always been a pioneer in blazing that difficult trail—more adequate care for the nervously and mentally ill. In the history of modern psychiatry the State of New York is noted for its readiness to make provision for the neuropsychiatric patient. A special honor and privilege, therefore, was extended to me when your chairman, Dr. D. C. Wilson, invited me to tell you something of our results in the care of neuropsychiatric patients in a general hospital.

Our earlier experiences have been recorded.¹ Accordingly, we shall make reference to those past experiences only in summarizing manner. We judge that the establishment of a division of neuropsychiatry in any particular general hospital should be a matter of gradual growth than a sudden installation. We are convinced that all types of psychiatric patients can be managed in a general hospital with adequate facilities and understanding personnel. More liberal provision by general hospitals for the care of neuropsychiatric cases will do much to relieve our state institutions.

### Facilities and Organization

In order to more appropriately emphasize some of the results of our venture of maintaining a division of neuropsychiatry in a general hospital, let me first burden you with some details of hospanization.

From the print thrown on the screen you will observe that the hospital building approximates in form a roughly blocked letter H (See illustrations I and II). Its cross bar is disproportionately long and is halved by the central octagonal building which houses the major administrative functions. Observe also that this central portion is a seven floor structure, whereas the remaining portion of the main hospital building has only five floors. The outline of the cross bar of the H is quartered by open air porches at the level of each floor on both the north and the south sides. Similar

porches project from each floor on both ends of the wings, or sides of the H, and their middle portions. The floor plan of that portion of this main hospital building given over to the housing of patients is essentially the same in arrangement. Each floor unit consists of 24 single rooms with a centrally placed nursing station With 12 rooms in direct line on each side of it, this nursing station affords unusual opportunity for supervision (See illustrations III and IV) No patient can enter or leave his room without being seen, the call bell is displaced by a signal lighting system. The patient on pressing a button at his bedside turns on a small light above and outside his room door and with the same movement a light appears on the signal board before the nurse at the central station Neither of these lights can be extinguished without pressing a companion button in the patient's room. This mechanical safeguard, therefore, requires the attending nurse to go to the patient's room to give the requested attention. All rooms at present available for patients in this main hospital building are single rooms with bath, hence considerable hydrotherapy can be resorted to on that provision alone. These and many other details of organization have also been recorded previously.23 We will for that reason dispense with further general discussion of a background the necessity and the importance of which is surely granted.

The majority of our neuropsychiatric patients are cared for on the first floor of this main hospital building. A considerable number, however, are treated on the other floors as well and the treatment of some is successfully managed in double rooms or in 3 to 4 bed wards in another building (the "M" building). The personnel in attendance on these patients is highly important. We feel no general hospital should undertake the venture of treatment for mental cases unless the services of a well qualified neuropsychiatrist are liberally available. Our own staff consists of full-time members only, a neuropsychiatrist in charge, an associate neuropsychiatrist, a senior assistant, 4 junior assistants, a psychologist, and a psychi-

Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929,

atric case-worker. Just at this time the positions of associate and senior assistant are vacant and "sledding" is correspondingly harder I can assure you. In addition to this unit staff we have the

day is divided into three sections. During the morning section, from 7:30 A.M. to 3:30 P.M., supervising nurse with 4 nurses assisting; during the second section, 3:30 P.M. to 11.30 P.M., a supervising nurse with 3 nurses assisting; during the third section, 11:30 P.M. to 7:30 A.M., one supervising nurse and 1 nurse assisting her. This < applies to the F unit, 24 beds on the first floor, where most of our nervous and mental patients are treated-and differs but slightly from nursing provisions in other parts of the hospital. Two orderlies, or attendants, are constantly on duty from 9:00 A.M. to 5:00 P.M. and one from 5:00 P.M. to 9:00 A.M. Maids, men from utility force, and kitchen help carry out all cleaning procedures and serving of meals.

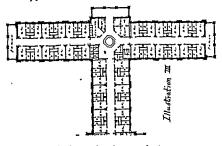

To promote uniformity of examination and to facilitate a reasonable opportunity for observation, we have long maintained that we cannot satisfactorily undertake the study of a psychiatric inpatient, i.e., a patient admitted to a room in the hospital and whose primary problem is psychiatric, unless that patient is willing to stay at least 7 days and better 10 days. In other words, we hold that 10 days is the minimum period of observation upon which we can reasonably base diagnosis and advice in a strictly psychiatric difficulty. In some cases the 7 day period of study is sufficient, but detailed reports and medico-legal interpretations are too frequently called for to permit us to take any chances on shorter periods of study. For neu-

assistance of two internes and one supervising second or third year physician, the latter in the capacity of an assistant to the resident physician of the medical department. All three rotate, as a rule, every two months. Nurses are provided after the following plan: All nurses of the hospital force are on eight hour duty. Special nurses called in from outside sources are on 12 hour duty. For our "regular duty" nurses, then, the rological conditions we have found a 4 to 7 days period adequate.

We have no barred windows or locked doors. nor are the large panes of our windows reinforced. The size of the window and the glass used of course is taking things as we find them rather than having them made to order. Naturally, we would prefer the window size somewhat different and the glass, also, of different

We insist that no physical restraint be used. Occasionally physical restraint has been necessary but in those instances, order for such restraint must always be approved by the neuropsychiatrist in charge. Dry packs are regarded as forms of physical restraint. The wet pack is not, formally, so regarded, especially if the patient is put at the same time into a portable tub. No narcotic drugs are prescribed without the approval of the Division Chief. We per-

sonally feel the only drugs of that category that are at all permissible are apomorphin and

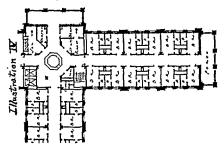

very occasionally hyoscine,

We like a certain number of routine laboratory determinations, not only for the reason that they are to be checks on the patient's physiology, but also that we have repeatedly found that such tests have a wholesome and reliable suggestive effect. Mental patients, as other patients, in the majority of instances credit laboratory determinations with a much greater reliability and precision than the physician himself, and such attitude causes the patient to feel that he is receiving truly noteworthy attention and it therefore helps to orient his general mental attitude. Among such routine determinations we number: Count, including: R.B.C., haemoglobin, W.B.C., and differential; blood Wassermann with Kolmer and Kahn techniques; urinalysis; stool examination; and blood chemistry for non-protein nitrogen and sugar. We, as other hospitals, have found the food, sleep, and weight chart an almost indispensable criterion. Although in general hospitals the temperature, pulse, and respiration charts stand as truly demandatory as the law of the Medes and the Persians, we have found equally important directory evidence in the food, sleep, and weight charts,

In the case of any patient showing symptoms of mental depression, it is a routine rule that when put to bed on admission, his street clothes are removed from his room as well as all obviously dangerous articles. If there is frank danger of suicide or elopement, the windows of the patient's room are blocked so that they cannot be raised or lowered more than 4 inches. This is a simple procedure and is always carried out while the patient is temporarily out of his room. For these cases precautionary nursing also is ordered. By such nursing we mean that some nurse on the floor must visit that patient every 10 or 15 minutes according to written orders. Occasionally we speak of vigilant nursing by which the nurse understands that she is to make occasional extra visits, e.g., she may have just made a visit to the patient and almost immediately return to make another in order that the patient may not be able to plan the frequency of her coming. If a depressed patient is actively suicidal, special nurses must be in attendance at all times.

Thus far we have avoided medico-legal entanglements to a surprising degree. It is very possible, however, since we are about to close our sixth year, that we may expect more such embroilments in the future. Even procedures of habeus corpus have thus far been avoided.

Male and female patients have not been segregated regardless of their conditions but have been permitted to occupy separate rooms on the same floor. Occasionally a male or female psychotic patient, sparsely clad, will wander

into the room of some patient of opposite sex, but a nurse is there almost as quickly. Naturally one anticipates consternation and even pandemonium. Thus far in our experience the latter has never happened and the former has been of such brief duration that it promptly yielded to explanatory persuasion. In such persuasion and in our attitude generally we encourage and maintain that the "co-ed" idea may be carried out in hospital treatment as in educational institutions, provided always of course that adequate understanding supervision is at hand at all times.

### Results of Treatment

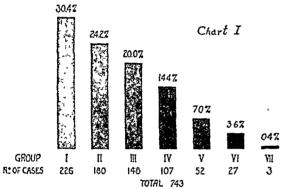

In our treatment of the nervously and mentally ill we have emphasized a careful diagnostic period followed by a period of therapy. On

ing these visits. By a unit of service we mean the carrying out of one therapeutic provision of any kind. Since a patient may receive one or more units of services on the occasion of any one visit, for example, a psychotherapeutic talk by the physician, a diathermy treatment, and even an intravenous injection of some tonic hematinic, the total units of service are of

### DISTRIBUTION OF DIAGNOSES - I.P. D. PATIENTS-1928

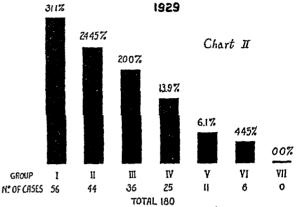

course somewhat greater than the number of patients seen. 743 patients were admitted to the hospital on the In Patient service. 546 patients on other services were seen in consultation. Our 743 In Patients included 77 patients transferred to us from other services in our own hospital. Of the patients admitted-into the hospital, there were 139 old cases, that is, patients with whom our Division had had contact in the past. 604 were new cases. The sex of the 743 admissions was 323 males and 420 females. About this same ratio seems to hold true so far this year, there being 118 males and 143 females for the 261 admissions for the first four months of 1929. Again, the 743 In Patients for 1928 were divided into 688 first admissions and 55 readmissions. The time our In Patients spent in the hospital during 1928 ranged from one day to 209 days giving an average of 14.48 days (median 9.27 days, mode 2 days).

Table III setting forth the disposition of the I.P.D. patients for 1928 shows that 75% of the total number of admissions were returned to extramural supervision. Nine percent were discharged as recovered and only 4% required transfer to other institutions. In grouping our

cases we have made one grouping according to the Army or the World War Classification (Table I and Charts I and II). That grouping gives us 226 psychoneuroses or 30% of the total number of admissions. Psychoses under this classification number 107, or 15½%. To give the diagnoses in a little greater detail, we

list them according to the classification of the American Psychiatric Association (Table II). Strict adherence to that classification gives us 131 psychoses. Recalling that only 30 of the psychoses were transferred to custodial Insti-

tutions, we judge that a general hospital Division of Neuropsychiatry has considerable to recommend it.

attitudes are thus constantly subjected to correctional interpretations.

The successful management, without transfer to other institutions, of two mental depressions arising among the professional staff members of the hospital served to bring about a confidence and an enlightenment impossible under the old attitude: "If he's a mental case get him out quick."

Educating not only the lay public but also the surgeon, the internist, and the other medical confrères of the neuropsychiatrist, that nervous and mental diseases are no less tangible than somatic diseases and that the patients suffering from them have as much right to their

Important as the significance of the foregoing data may be we judge that a still greater significance may be attached to the reception accorded a division of neuropsychiatry in a general hospital and the possibilities such relationship afford for appraising all concerned with the need of early recognition and appropriate treatment of neuropsychiatric ailments. Our hospital of some 475 beds carries on its roll roughly 1,000 employees inclusive of 120 doctors and 367 graduate and student nurses. These employees are sure to come in contact with our divisional activities and their mental

thoughtful consideration as the somatic ailments, is the keynote in bringing about alterations in the general management of neuropsychiatric patients.

In closing, may I enjoin you to ponder long and intensively this very need and put into action any constructive deduction your pondering may have yielded.

### ABSTRACT OF DISCUSSION

Dr. C. P. Oberndorf (New York City), empha-sized the need of "a half-way house," a semi-insti-tutional home where border-line cases of all kinds might be treated in the hope of avoiding the cer-

tification stage, and expressed the belief that our results in a general hospital were further evidence of that need.

He asked: Does a psychotic patient in the general hospital patient population alarm the neurotic? Dr. Edw. L Hanes (Rochester, N. Y.), asked the following questions:

Does the psychoneurotic actually cooperate in the

presence of a psychotic?

What really happens when a partially clad male psychotic steps into the room of some unsuspecting female patient?
How is such event interpreted by the hospital staff

and especially the lay personnel?

Do such and similar instances not promote more r less constant staff hostility and if continuous effort is necessary to bring peaceful understanding, is not that effort then out of proportion to the satistactory stability of the service you are trying to establish?

If you are not encountering such hostility, how have you avoided it and can others undertake the project you have outlined with reasonable assurance of success?

Dr. Thos. J. Heldt (in closing): Chemical restraint is a big subject in itself. It is too frequently resorted to, especially in our smaller sanatoria and the "Nursing Homes" with only periodic visits from a physician. My own habits of therapy and my instruction to those associated with me are very much against the use of the heavier sedative drugs. In soporific or hypnotic dosage such drugs mask highly important symptoms and befoggle observation.

At a time when the lay mind still rather doggedly adheres to the notion that mental illness is synonymous with personal or family disgrace, it behooves us, if we would seek gradually to change that atti-tude, not to be too dogmatic in our nosological designations. In tabulations and statistical reports it is proper and acceptable to use diagnoses of single word or abbreviated phrase but in dealing with the medical profession generally and especially the pub-lic it is our experience that the longer descriptive diagnoses of psychiatric ills and difficulties are more effective in selling our interpretations and in avoid-Observation and examinaing misunderstanding. tion of a particular patient may favor the diagnosis

psychosis with cerebral syphilis. We prefer to
record—syphilis of the central nervous system, with
irritability and excitement (or with depression, agitation, some intractability, etc.). If perchance the case be of meningitis type, we say-meningitis, luetic-emphasizing the commonly accepted etiology but making secondary record only of the associated nsychotic behavior. In our general hospital setting the written data on file in a patient's folder may be summarized and reported to the family physician or even the patient himself by someone other than a

staff member of the Division of Neuropsychiatry. In other words, the Division of Cardiorespiratory diseases may hold primary responsibility in the patient's case and the neuropsychiatric division only consultation or secondary interest. Accordingly, neuropsychiatric findings, language, and records, must not offend patient, family, or their physician, however definite our own mental reservations and guarded our therapy and prognosis. It is, therefore, obvious, we believe, why in practicing neuro-psychiatry in a general hospital that the patient should always receive the benefit of the doubt.

As remarked in the body of my paper, a sparsely clad psychotic patient does occasionally step without warning into the room of some patient of opposite sex. The patients concerned and the attending personnel meet the situation at once and usually so effectively and amiably that nothing further comes of the incident. Should a provoked relative make his way to the superintendent (a non-medical man) or the physician in chief, both of these officials will calmly try to clarify the situation by appropriate explanation. If much vituperation is indulged in these same officials have always shown me the deference of letting me get in on it, and, as a rule, the final result is just another lesson in social psychiatry to all concerned. In other words, the hospital authorities accept their neuropsychiatrist and his division at face value. He is expected and does, "peddle his wares and strut his stuff" as much and as well as any other hospital division. Dissatisfaction are not disproportionate to the importance of our project nor are they so frequent as to be discouraging,

Dr. Oberndorf in referring to the "half-way house" emphasized an urgent need not only for the State of Michigan but many other States. We understand New York has for some years been considering a preventorium for mental diseases and we judge Dr. Oberndorf's suggestion is but a further expression in that direction,

Since the majority of our psychiatric patients are cared for in single rooms and since their average length of hospital admission is only two weeks, the occasion for acquaintanceship of one patient with another is limited. If the psychotic behavior of any patient should come to the attention of a neurotic or a psychoneurotic it is quite as likely to incite pity and solicitation as it is fear or alarm, especially if the attitude of all attending personnel is in the direction of the former. Hypercritical relatives give us far more difficulty than the patients. Such relatives are usually dealt with in one or all of the following three ways: No visitors allowed for a specific product of the such as t cial period of adjustment ranging, as a rule, from three days to a week; painstaking persuasive ex-planations; or frank invitation to take the hypersensitive beloved patient to a more protected hospital or home environment. Our patients generally yield promptly to understanding persuasion in the

absence of interference from relatives and our most refractory ones become cooperative within a week

to ten days Just at this time in our venture one of our greatest difficulties is to convince the lay hospital personnel that neuropsychiatry is considerably more than the art of persuasion, that it has its technical and time consuming procedures just as truly as general surgery, and brain surgery in particular. A painstaking mental exploration to determine the patient's ego-strivings and the various urges of his libido cannot be crowded into that short space of time in which the nose and throat man explores and treats all the nooks and crannies in an aching head. One, two, and three hours at a single sitting are often necessary and a repetition of such sittings is common, as all will agree, not for persuasion but for technical psychiatric evaluation. Although we have our share of misunderstandings in the management of our division of neuropsychiatry in a general hospital, we feel certain that others may safely and profitably undertake the project.

We manage our noisy patients at present mainly rough intensive hydrotherapy and carefully planned exercise, principally walking and by an oc-

casional and timely dose of apomorphin. We are looking forward to more liberal facilities. With an ample "day-room" and sound-proof rooms, it should be a pleasure to care for the noisy patient and not a hardship.

No, we do not confine ourselves to the milder psychoses. We frequently admit acute and ful-minating types. We have treated several actively

violent and homicidal.

### THE PRACTICE OF MEDICINE—INDIVIDUAL AND COLLECTIVE By LINSLY R. WILLIAMS, M.D., NEW YORK, N. Y.

N endeavor will be made in this paper to outline some of the changes that have taken place in a comparatively short time in the individual practice of medicine, the advantages and disadvantages of the various schemes for the collective practice of medicine, and their relation to the economic status of the medical profession and the community. It is clear that in the limits of time it will not be possible to touch upon every point which has arisen on these two questions, and certain aspects of the problems will necessarily have to be dealt with with extreme brevity or not at all.

There is little need to outline to you the history and the traditions of the individual practice of medicine. We all recognize the importance of the general practitioner and his personal relationship to his individual patients. We often speak with regret in our large modern cities of the passing of the family physician, who was not only a physician, but a valuable advisor, counselor and friend. There have been important changes in this relationship which have in large part been due to the actions of the members of the medical profession themselves. The medical profession has contributed largely to the increase of scientific knowledge in all the branches of medicine and these contributions have come from medical schools, hospitals, outpatient departments, laboratories, and from individuals working alone in their own private laboratories, or as a result of study of their own private pa-

\* Read before the Medical Society of the County of New York, October 28, 1929

tients. This increased amount of knowledge has resulted in the growth of specialism and the limitation of practice by many physicians. It has not been uncommon in our larger cities for a patient to go to his family doctor to have a brief interview and to be referred to a specialist. Theoretically the patient is to return to the general practitioner so that he may continue his interest in the patient and see that the therapeusis is carried out. The patient, however, after a number of incidents of this kind, asks himself, "Why is it necessary for me to go to my family physician first? I pay him his fee-he does nothing for me except to refer me to someone else." Consequently, the patient has begun to go direct to the specialist, and among the more well-to-do classes in our large cities, specialists may be consulted on a number of occasions during the year and the patient never sees the family doctor. In many of these instances the services rendered by the specialist are no more than could be rendered by the family physician if he were willing to take the time and make the effort necessary, and very probably to the advantage of the patient and also of the family practitioner. There are other instances in which a question of diagnosis may arise, where the patient is referred to several specialists and laboratories because the physician feels himself less competent than the expert to make the proper technical examinations, and in some instances it has happened that such examinations are made so that the family practitioner may receive a rebate of the specialist's fee,

## Disadvantages of Individual Practice

Some of the advantages of individual practice have already been commented on and are clear to most physicians. There are also a number of disadvantages. The general practitioner frequently loses contact with his patient or loses him altogether. It has not been an uncommon practice in New York for a general practitioner to send a patient to a privately endowed hospital for a surgical operation. If, during the course of the disease, some medical difficulty arises, one of the hospital attending staff has been called to advise with the surgeon, instead of telephoning the family physician and asking for his advice. Further, in the case of a ward patient upon discharge, it has not been found uncommon to have the patient referred to the outpatient department for follow-up instead of referring the patient back to the family physician. This last situation has received a good deal of consideration by the profession in New York City with the hope that the hospitals will make some effort to correct what is obviously an unfair practice. There are certain definite disadvantages of the prevailing system to the public. There is a considerable loss of time in seeing one specialist after another, a lack of understanding in learning that one or more specialists will not accept the laboratory findings furnished by another specialist, and require a duplication of the work, for which the patient sees no value but only an added expense.

The fees paid for professional services by the individual patient may not have been increased any more than the increase in the cost of living during the last decade warrants, but the fees of several special consultants for examinations which might possibly have been done in some instances by the general practitioner, have largely increased the total expenditure for professional service. The question therefore is definitely raised: "How far can the general practitioner accept the responsibility without any special consultants or laboratory examinations?" A little over a decade ago, a patient was under treatment for a disease which was then called angioneurotic oedema. Upon the retirement from practice of his physician the patient was referred to a very competent practitioner. Several months later the patient had a severe attack of localized oedema and the new physician was consulted. There were x-rays, blood analyses, metabolism tests and so on, and after these were completed, the doctor told the patient that he had angio-neurotic oedema. "What can be done for the disease?" "Nothing more than has been done before." The examinations cost the patient nearly \$300. Is work of this kind conscientiously done for the interest of the patient

or it is done primarily for the interest of physician - not necessarily financial? One other instance will show the apparent necessity of completeness of examinations. A middleaged woman had an epileptic seizure, the first one in her life, and the family physician was called, who made a diagnosis of epilepsy atarda. He suggested that it would be advisable to have her examined by a neurologist. A complete examination was made by the neurologist, a Wasserman was taken, the spinal fluid was examined and an x-ray of the skull made. It is recognized that in a case of convulsion, it is worth while to exclude any possible organic lesion in the central nervous system, but the case is recorded here to show that whereas ten years ago the cost of professional service for this patient would have been three or five dollars, in this year of grace, it cost over one hundred dollars.

## Cost of Medical Care

There has been a great deal of loose thinking and writing on the subject of the cost of medical care. We should be extremely careful in differentiating between the cost of medical care, which includes payments made to institutions, to technicians, for nursing service, etc., and the actual cost of professional services paid to physicians. It may be accepted pretty generally that professional fees, whether charged by the general practitioner or the specialist, have not increased any more than the increased cost of living warrants. We must, however, exclude a certain number of instances where physicians really charge far more than the patient can afford. In an editorial entitled: "An Exploded Myth," published in the June, 1929 Bulletin of the Toledo Academy of Medicine, there is a reference made to an article entitled: "The High Cost of Medical Care," by Dr. C. W. Waggoner, President-Elect of the Ohio State Medical Society, and without quoting from this article. the editor goes on to say:

"The average net income of physicians throughout the United States is \$3,000 per annum. Twenty million dollars worth of free medical care is donated each year by the physicians of the State of Ohio alone. Twenty-two million dollars are spent during the year in the United States on super-luxuries such as cosmetics, candy, tobacco, etc. Between two and four millions in a year are spent on medical service."

It has been assumed that this statement was made inadvertently, as it is obviously incorrect. For if the average earnings of a doctor in Greater New York per annum are \$3.000, this makes a payment of \$30,000.000 for professional services alone in one city. If

only four millions are spent on medical service in the United States, this distributed amongst over 150,000 physicians, would be \$26 per annum per physician. If only four millions are spent in the State of Ohio where there are 8,432 physicians, their average income would be less than \$500. Is the statement of the editor then convincing that two to four millions are spent on medical care in the United States or Ohio if he meant Ohio? If the average income of the physician is \$3,000, and there are 150,000 physicians, the amount spent is \$450,000,000 on professional services. Twenty million dollars worth of free medical care is donated to the State of Ohio alone in one year." There is no way of estimating the value of medical services which are donated. It is a common statement of physicians that they donate their services to the poor in their hospital work. Is it really a donation? physician gives his services to the hospital or outpatient department free, but if one should ask the visiting physician or surgeon of one of our larger hospitals why he gives this service, and why doesn't he resign his position if it is so burdensome to him, he will very promptly reply that the position is very valuable to him, that he keeps up his study of medicine by this means, that he sees a considerable number of younger physicians, who, as they pass out from the hospital or dispensary, call him in consultation, that the prestige of the hospital brings him new patients and that the position absorbs his interest and is a very valuable one to him and there is actually a quid pro quo in the matter which should be recognized.

The suggestion has been made in many quarters that hospitals and dispensaries should pay for the services of physicians. It is evident that in a number of dispensaries, physicians are now being paid for the simple reason that they do not receive any other return for the services rendered. This is particularly true in the fields of laboratory work, pathology, and x-ray, and the hospitals and dispensaries will only begin to pay for the services of physicians when the physicians are so busy that their private practice will make them unwilling to give the time without being adequately compensated therefor. In other words, the old economic law of supply and demand will hold here irrespective of the wishes and desires of the physician.

### Further Disadvantages

It is quite clear that a number of prominent laymen are keenly interested in the medical profession and are very desirous of seeing some change in medical organization that will make it possible for the medical profession to render more and better services to the com-

munity. These laymen recognize as keenly as we do that there is no restriction placed upon the practitioner from attempting any surgical or special procedure that he desires except the limitations of his own conscience. We recognize with perfect clarity that many physicians are not competent to undertake certain procedures and that in some instances physicians may feel that they are qualified, and make mistakes which are disastrous. The patient has no redress until after the damage has been done, when he may bring a civil action. Our lay friends therefore say. "Why do not you of the medical profession determine who are qualified in the various fields?" It is recognized that no process of education will be able to guarantee the character of the physician licensed to practice or determine his powers of judgment. He may be well informed in detail but yet unscrupulous in character and lacking in judgment. We recognize too the fact that not a small number of physicians who have only limited their practice, actually hold themselves out as specialists after little or no training or experience, with the sole expectation of receiving the specialist's fee, which may be double that of the ordinary practitioner.

### Collective Practice

By the term "Collective Practice" is included:

- 1. The practice of medicine in hospitals, medical school clinics, pay or free, outpatient departments, general or special.
- 2. Such individual practice as may be carried on under the direction of health or educational departments which employ physicians to perform vaccinations against small-pox or typhoid, or for the administration of toxin antitoxin, and for the examination and diagnosis of patients in school clinics, child welfare clinics and special venereal disease clinics.
- 3. Voluntary health agencies, which maintain services similar to those mentioned under health and educational departments.
- 4. Industrial medicine.

Our modern hospital is a business organization, organized for the purpose of diagnosing and treating patients within the walls of the hospital. It provides special consultants and technicians so that all of the work relating to the patient can be done in one place. As a rule hospital treatment conserves the time of the patient and also that of the doctor. The patient is able to have all the examinations and treatments made without going from one place to another, as is commonly the case in private practice, and the physician is able to see a considerable number of patients

in the wards and in private rooms in a shorter space of time than he would were the patients in their own homes. This is a demonstration of the economic fact that proper distribution of labor increases production. On the other hand it is noted that there has been a marked increase in the cost of medical care in the hospitals. This is largely due to the interest of the physicians in securing for the patient every possible type of diagnostic test which may not always be of benefit to the patient but is of marked benefit in the training of the interns and attending staff, It is quite evident that in many of our larger hospitals, the standard of medical and nursing care is far better than that usually obtained at home, even under the best of circumstances. There is another factor in the hospital care which is of importance and that is that the house staff and the junior members of the attending staff have their work under the constant supervision of their seniors, which does not obtain at all in private practice. By this method the juniors are able to learn more, to have their work checked up and to be daily advised by their older and presumbly wiser staff members. In the surgical field the exactions of the American College of Surgeons have been of considerable value although some surgeons complain that it consumes too much of their time. In our large private hospitals as organized at present, the senior members of the staff undoubtedly receive many privileges-the opportunity of making use of private rooms and the friendship and admiration of the junior staff members and the interns who come and go. There has been a great deal of criticism of this system of closed hospitals and many have urged that other physicians be given the privileges of the hospital. If a system could be devised which would permit of general practitioners sending their patients to a hospital and the management of the patient to be controlled by the seniors of that hospital and the physician to have the opportunity of seeing not only his own patient, but to make rounds with the visiting staff, it would undoubtedly improve the situation in many of our cities.

# Encroachment on Individual Practice

It is quite clear that the hospital care which is generally accepted by county societies as a necessity for the care of patients even though they pay part or all of the cost of ward treatment, encroaches on private practice. It is not uncommon in this city for patients to pay \$21 a week for ward treatment, and this may be about half of the total cost to the hospital, not including any interest on the building, but a patient who is able to pay \$21 a week, might under certain circum-

stances, be equally well cared for at home and be able to pay part of this sum weekly to a private practitioner.

On the other hand, it is quite obvious that many patients can be far better treated at a hospital than at home, and many of these patients cannot afford to pay a small fee for medical care, but when they enter the hospital, their payments are made primarily for institutional care and nothing to the medical staff. There is undoubtedly a loss of income here to the medical profession.

In the outpatient department of the hospitals, the college clinic and the dispensary, whether they be recognized as pay clinics or whether they only charge a nominal fee to pay an overhead cost of the maintenance, the situation is very similar to that of the hospital. These clinics are conducting a group practice where all the special consultations may be made under the one roof, conserving the time of patient, and it also offers opportunity for the physician engaged in work in the dispensary to consult with each other to their own mutual advantage. It is recognized, however, that in many dispensaries the medical administration is very lax. Physicians are irregular in their attendance and apparently there is not a sufficient quid pro quo to make the service attractive to them. In these cases it would be better to have the physicians paid so that it would be possible to definitely control the hours of their coming and going. If it is true that physicians are serving outpatient departments and dispensaries less and less, and are demanding pay for their services, it indicates that their practice is too lucrative for them to expend their time on this type of work, and that in the course of time salaries will have to be paid for this work. It is recognized further, that in the dispensary as well as in the hospital there is some supervision of the junior members of the staff, although this is not recognized as such by the juniors.

## Encroachment on Private Practice

There have been a great many statements made by county societies and members of the medical profession, of the encroachment made on medical practice by patients being accepted at dispensaries who are able to pay. It may be true that people drive to a dispensary in automobiles and it may be true that an individual earning \$75 a month may own an automobile which cost \$50, and who does not feel that he has money to spend on medical service, but it is recognized that dispensaries are more and more employing social workers to investigate the financial conditions of the patient, and that many patients are refused treatment at the dispensary because they can afford to pay. A very vexing question often occurs when the patient can afford to pay: to whom should the patient be referred? It is not uncommon for a patient to go to a dispensary fairly well able to pay, who has been to several private physicians who have given him no relief and to whom he has naid a considerable amount of money. A number of cases are known of definite neglect on the part of the general practitioner. One instance will suffice-A patient came to one of our city clinics some years ago who had seen seven different physicians and who had paid out over \$100 in cash to them and was told that he had rheumatism or neuritis in his shoulder. He stated that none of these physicians had made a physical examination of his shoulder. He was accepted into the dispensary, examined and had a simple dislocation of the shoulder joint corrected to his great relief. May it not be true then that in a certain number of instances the increased use of dispensaries is a result of improper medical practice in the offices of private physicians?

### Voluntary Health Agencies

It is claimed by many physicans that voluntary health associations are constantly encroaching upon the legitimate practice of medicine. These associations have been active particularly in the fields of tuberculosis and child welfare and they have conceived their chief functions to be the organization of dispensaries, the employment of nurses and the carrying on of health propaganda or health education.

The tuberculosis dispensaries as created have been maintained usually under the voluntary associations direction and in almost every instance subsequently transferred to a local authority, usually the health department.

There has been considerable discussion in the voluntary associations as to whether or not there should be a financial investigation of a patient affected with tuberculosis. Many of our health authorities and physicians and lavmen have insisted that as tuberculosis is a communicable disease, the health authorities should examine, diagnose and advise patients and if found to be open cases, recommend their segregation in hospitals. On the other hand, many physicians have been more insistent that whether this was a communicable disease or not, the patient should be investigated and if able to pay, should go to a private physician. There has also been a good deal of criticism by physicians that some of these patients are accepted who could pay, and that they are occasionally treated in one of the dispensaries. It is quite true that in many instances patients have been treated in

accordance with the precepts of the health department.

Child welfare stations have grown up in large numbers and have usually been centers where well children are brought by their mothers for consultation and advice as to feeding and means of keeping the child well. In these stations, it has not been considered that they were interfering with private practice if home remedies were suggested.

It would be very difficult to prove how much economic loss there had been to the medical profession as a result of these two types of work. On the other hand, it is believed that as a result of continuing propaganda used over many years throughout the country, many mothers take their infants to see a doctor in order to have the doctor keep the child well and that many patients go to private offices to be examined for tuberculosis who would not have gone had it not been for this propaganda. Whether these two factors balance each other or not can not be ascertained. In general it is felt that the total amout of practice has increased but that the encroachment on private practice in these fields has not been serious.

### Health Departments

Health departments from their inception have been engaged in two distinct branches of work—public health work and preventive medicine. By public health work is meant mass measures which do not deal directly with an individual, as for example, the purification of the water supply. With these measures the medical profession has had no quarrel although there has been the rare selfish individual who has complained of water purification because it took away his annual income from typhoid patients.

Health departments have been engaged in the practice of preventive medicine by examining, diagnosing and treating individuals, primarily those who may be affected with communicable diseases. It has been recognized for generations that it was the function of the health department to maintain communicable disease hospitals where the more acute contagious diseases were isolated and cared for by the department irrespective of their financial status.

Also, the health departments have employed public vaccinators who vaccinate against smallpox, their salaries being paid by the city, and although this function is usually accepted by the physicians they are quite generally opposed to health departments carrying on a similar activity in the administration of toxin antitoxin.

or the Panel System of Britian. Two features of the Panel System should be commented upon. First, the individual patient has a certain freedom of choice in the selection of his physician and is allowed to change his physician and second, all of the industrial and agricultural workers are insured and pay their part toward the cost of the insurance, and as all of them are required to go to a panel doctor all their professional services are paid for by the Government so that there are no uncollected bills among the insured individuals and the average income of the panel physician for his panel practice alone is over \$2,000 a year.

## Voluntary Insurance

No scheme of voluntary insurance has been suggested which would provide professional medical care for the insured. If such a proposal were made by a large insurance company, there would be an immediate discussion as to how the insurance company would provide professional care. There could only be one of three methods—to employ physicians of their own on a salary basis and to establish their own hospitals, clinics and laboratories and this system would undoubtedly be severely criticized by the medical profession. The insurance company might make use of the existing facilities and pay hospitals, dispensaries and laboratories for work performed or it might contract with the organized medical body in the vicinity to furnish such medical care. If this latter scheme were suggested and accepted by the medical society, the medical society would be obligated to define certain standards of medical practice in the specialties and to determine whether or not its members were qualified by training and experience to perform the duties which would be required of them.

# The Future of Medical Societies

During the past three decades, it has been the usual practice of medical societies to oppose all encroachments upon the individual practice of medicine.

It must be recognized by the medical societies that the cost of professional services and medical care has increased in our large cities at least although the fees of the general practitioner have generally not increased, the various agencies engaged in the collective practice of medicine have in most instances reduced the cost of professional services even though many of the hospitals have not reduced the total cost of medical care.

What suggestions have been made by medical societies to meet the criticisms of the public? What suggestions have been offered by the medical societies which would reduce the

cost of professional service? Be it noted here that although medicine is not a business. it is influenced by business methods and economic law and if business can reduce the cost and increase production may it not be true that medicine may do likewise. So far as is known, the only constructive suggestion made has been that the medical society operate its own clinic. What further could the medical society do? Could they organize their own hospitals, clinics and laboratories and establish group practice? Are the medical societies at the present time organized to undertake such efforts? Can they raise the capital necessary and construct and maintain the building and equipment necessary? Can they determine, which of their membership would serve in the first hospital, clinic and labora-Can the medical society determine tory? what type of service is to the best interests of the medical profession and what to the best interests of the community? Will they take the community point of view or will they take the point of view of the advantage to their own membership?

The population of the City of New York of nearly 6.000,000 has a large group which very regularly make use of our outpatient departments. \*In 1927 there were 1,250,000 individuals making nearly 6,000,000 visits at our dispensaries. These dispensaries were primarily organized for indigents who could not afford to pay anything for a physician. is known, however, that in the City of New York the number of indigents recognized as such by the Department of Welafre and the voluntary agencies, is less than a tenth of this figure. 342,337 patients made 2,375,396 clinic visits. This large group of individuals have no money in their budgets for professional services and they do not have for the reasons enumerated above. Can the medical society suggest some scheme by which these individuals either voluntarily or under compulsion may set aside a small amount of their earnings weekly or monthly? If there are 1,250,000 going to the dispensaries and outpatient departments and paying 25 or 50 cents or a dollar a visit when occasionally ill, could not these same individuals set aside the modest sum of \$6 a year which could be used for professional services? At least the sum of \$750,000,000 is lost annually by the medical profession because there is at present no means of persuading or compelling these individuals to consider professional services as a necessity of life. Will we as medical organizations, do anything constructive about it?

<sup>\*</sup> Report of Committee on Dispensary Development. Davis, p. 6, 1927.

# A CASE OF HEART BLOCK, WITH STOKES-ADAMS SYNDROME, TREATED WITH BARIUM CHLORIDE AND DIGITALIS

By G. M. PARKHURST, M.D., BATH, N. Y.

ASES of complete heart block are relatively rare, and the one I am reporting showed not only complete block, but repeated attacks of typical Stokes-Adams syndrome, i. e. a stopping of ventricular contraction for fourteen to sixteen seconds, cyanosis, loss of consciousness, and general convulsive movements.

Sir James Mackenzie, in discussing the Stokes-Adams syndrome, states that these attacks are most likely to come before complete heart block is established, that is, when partial heart block is occasionally interrupted by periods of complete block. Other authors seem to consider the attacks are just as prone to occur after complete block is established.

As regards treatment, it is manifestly out of the question to re-establish the normal conduction impulse to an auriculo-ventricular bundle which is the seat of fibrous or other degenerative changes. The aim of treatment. therefore, is to increase the irritability of the ventricle, thus lessening the chance of prolonged cessation of ventricular contraction, with the accompanying Stokes-Adams attacks. Barium chloride, in doses of gr. 1/2, four times a day, has been reccommended by Levy and Mackie, Journal A.M.A., August 6, 1927, as affecting the ventricle in this manner. Other authors point out that full doses of digitalis may produce the same effect, when block is complete, although contra-indicated in partial block.

Both drugs were used in the following case, with no increase in ventricular rate, as might have been expected, but with complete cessation of the Stokes-Adams attacks.

Case report—Mrs. C. A., age 54, admitted to Bath Hospital on April 24, 1929.

Chief complaint—Two attacks of generalized convulsions, with loss of consciousness, occurring three and one days before admission. Considerable loss of weight during past six months.

Family history. Essentially negative.

Past history. Usual childhood diseases. No serious illness in recent years.

Present illness. Except for a steady loss of weight, amounting to some 20 pounds during the past months and slight shortness of breath on exertion, the patient had no untoward symptoms, until the first convulsive attack three days before admission.

A second attack had occurred two days later, and on the day following her entrance to the hospital a typical Stokes-Adams attack was witnessed, with cessation of ventricular contraction, cyanosis, loss of consciousness, and generalized convulsive movements.

Physical examination. The essential findings were a heart, moderately enlarged to left, action regular, beating 34 times a minute. In the 3rd and 4th space, just to left of the sternum, could be heard the faint, muffled auricular contractions Blood-pressure 190-70. Very slight oedema of feet and ankles.

Laboratory findings. Wassermann and Kahn negative. Blood-sugar 258 mg. 100 c.c.

Urine. Albumin a trace, sugar heavy reaction, acetone and diacetic acid faint traces. Phenolsulphonthalein test, 35% in two hours.

The patient was kept in bed for a period of ten days. Barium choloride gr. ½, put up in a simple elixir, was given four times a day and Digitalis, ten minims of the tincture, three times a day. This was later cut to twice a day. The Diabetic condition was controlled on a diet of Protein 63 grams, Fat 154 grams and Carbohydrate 111 grams. Insulin 20 units before breakfast, 15 units before supper.

Since the day following admission to the Hospital there have been no further Stokes-Adams attacks—six months, as this is being written. The pulse has not varied perceptibly at any time during this period, always being counted from 34 to 36 beats a minute. The oedema about the ankles has disappeared, and with the diabetic condition controlled, the patient feels much better and has ceased to lose weight.

### THE TREATMENT OF EPIDEMIC MENINGITIS\*

By JOSEPHINE B. NEAL, M.D., NEW YORK, N. Y.

In charge of the Meningitis Division, Research Laboratory, Department of Health, New York City Director of the W. J. Matheson Survey of Epidemic Encephalitis

ALTHOUGH antimeningococcic serum has been accepted in the treatment of epidemic meningitis for 22 years, there is still considerable difference of opinion in regard to the

best method of its administration with respect to route, frequency and amount.

Epidemic meningitis is a rather rare disease except in times of epidemics and during these 22 years there have been comparatively few outbreaks reaching epidemic proportions. In

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 6, 1929.

with meningitis is most important. They should be disturbed as little as possible, and if they are restless, sedatives must be administered. Adequate nourishment should be given and the fluid intake must be sufficient. Care should be taken to prevent acidosis. Retention sometimes occurs so that catheterization is necessary. Constipation is the rule and enemas or high colonic irrigations are better than purgatives.

Meningitis is a serious illness, by reason of the vital nature of the structures involved and the irregularity of the course due in part to the possibility of blocking or adhesions which prevent or render difficult the application of serum to the foci of infection. This gives rise to a great variation in the problems presented by different patients. For this reason it cannot be too strongly emphasized that experience in dealing with cases of meningitis is very essential. Aside from factors beyond our control, such as the severity of the infection and the resistance and age of the patient, the three most important factors in the mortality are the stage of the disease at which treatment is begun, the potency of the serum and the method of treatment.

It is generally accepted that, other things being equal, the earlier serum treatment is given, the better is the prognosis. The great variations in the therapeutic value of different sera has been demonstrated most conclusively in the past few years. Unfortunately there is no laboratory test that adequately measures this difference. As a result much serum has been used that has passed the accepted standards but that has proved to be useless clin-Indeed the exact way in which the serum exerts its curative action is not entirely understood. That its action is specific and not due to a general protein reaction would seem to be proved by the fact that some serum is very effective while other serum is of practically no value. The serum seems to have little bactericidal power, at least by its action in vitro. From the changes in the smears of the spinal fluid of cases responding to treatment, it would seem that its chief action lies in increasing the phagocytic power of the cells or in so affecting the organisms that they may be more easily ingested by the cells. In laboratory tests this action takes place when the serum is highly diluted. Serum injected intraspinally does not entirely pass out of the subarachnoid space for about 24 hours. For this reason a 24-hour interval of injection seems to be logical. We have thought it probable that removing fluid at more frequent intervals might remove cells that had been stimulated to a high degree of phagocytic power, and were, therefore, actively combating the infec-tion. Since the serum has apparently so little

bactericidal power, the administration of large amounts at frequent intervals as in the intensive method of treatment, seems to us unnecessary from a theoretical viewpoint. Moreover, performing a lumbar puncture and administering serum two to four times daily, subjects a patient to considerable pain and discomfort, and keeps him in an almost constant state of local reaction to the serum. By this reaction I mean the rise in temperature and increased meningeal symptoms and restlessness which in the great majority of instances takes place in two to four hours after the serum is injected and continues for a varying length of time. Then too, horse serum is a foreign protein that must be eliminated and that usually shows definite evidence of being more or less toxic. I am not at all convinced that the large quantities of serum that are given when the patient is intensively treated, may not be actually harmful in a certain percentage of instances.

To return to the question of the therapeutic power of different sera, I wish to congratulate the New York State Health Department on the excellent quality of their serum. spring and summer, we used a considerable amount of it with most gratifying results. While for a time recently our City Health Department serum was not of good quality, since the fall of 1928, it has been satisfactory. have lately studied 65 consecutive cases treated at Willard Parker Hospital where a conservative method of treatment is used and by the members of the Meningitis Division. Of these cases 30 were treated by the Meningitis Division. Four patients died, a mortality of 13.3 per cent. Two of these cases had only one injection of serum. Of the 35 cases at Willard Parker Hospital, 8 died, a mortality of 22.9 per cent. Of these eight fatal cases two had only one injection of serum and two more were suffering from bronchial pneumonia when they were admitted to the hospital. The mortality of the 65 cases was 18.5 per cent.

In the fall of 1926, as the results of the use of the ordinary antimeningococcic serum had been for some time rather unsatisfactory, Dr. Banzhaf, at our request, made for us an antibody preparation from the serum.

As the preparation of the antibody is still more or less in the experimental stage, and as certain lots of the antibody proved unsatisfactory, probably because of the poor quality of the serum used, complete statistics of the results of treatment with the antibody will not be given at this time.

In a general way it may be stated that, when a satisfactory preparation was used, the results were generally especially favorable. The mortality in the first twenty-four- cases that were adequately treated with the antibody was only 12.5 per cent. Of the three that died, one had

been sick six weeks before the meningitis was recognized and was in a state of extreme malnutrition. One patient died during a relapse which had been present more than a week before we were informed of the recurrence. The third patient developed a severe meningeal hemorrhage and died as a result of it.

Of these patients, a certain number were treated with antibody from the first, and most of them responded with unusual promptness In other cases the autibody was used after the ordinary serum had failed to produce results

The agglutinating titer of the antibody prep arations has been much higher than the serum from which it was made. We hesitate however, to stress the value of the agglutination test as we have observed that it does not run parallel with the therapeutic action of the serum

During the past year and a half, the demands for serum have been so great, that it has not been possible for us to experiment further with the antibody, as the production of it is very costly in serum. While we realize that it is still in the experimental stage our experience leads us to hope that it may be so developed as to be more effective in the treatment of epidemic meningitis than the serum as ordinarily prepared.

# METHOD FOR COMPLETE QUALITATIVE AND QUANTITATIVE ANALYSIS OF GASTRIC CONTENT WITHOUT WITHDRAWING ANY SPECIMEN

By MOSES EINHORN, M.D., NEW YORK, N. Y.

LTHOUGH the average stomach test will yield sufficient specimen to enable the exammer to make a complete qualitative and quantitative analysis, it occasionally happens that when the stomach is examined for fasting content the amount obtained is insufficient for the many tests required by the methods in current Aside from the theoretical interest which attaches to the method I am about to describe, I believe that it provides a practical solution for those cases where an analysis of the fasting content of the stomach is necessary and where even the best technique fails to produce any specimen at all or where the amount obtained is insufficient for such analysis Based as this method is upon several of my past contributions to this field, I find it necessary to give a short description of those contributions which are concerned here in order to show how they were combined to enable one to obtain a complete qualitative and quantitative analysis of gastric content without withdraw ing any specimen

This method involves the use of my recently devised Analytic Bucket which was itself a modification of my original New Tip for Gastroduodenal Tubes<sup>2</sup> The essential features of this bucket are its three-part composition, capsule shape and its distribution of weight which makes the bottom third of the bucket three times hervier

Figure 1
Analytic Buelet six times the actual size

The bottom third of the than the rest of it bucket is so constructed that there is a space between the outer shell (which contains four fenestra) and the central column the end of which is threaded to receive the lower cap of the bucket (Fig 1) The lower cap of the bucket is un screwed and in the space between the central col umn and the outer shell are inserted the following test strips used in gastric analysis Toepfer's Solution, Blue Litmus, Phenolphthalein and Saturated Solution of Benzidine instances, where it is necessary to determine whether there is bile present in the stomach, one of the above mentioned strips is replaced with a strip of plain paper By introducing this bucket into the stomach in the usual fashion and noting the changes on the strips through the fenestra provided for that purpose, a qualitative analysis of the stomach content can be obtained as shown by the table on page 84

Note that after the removal of the bucket, a few drops of hydrogen perovide are added to the strip of saturated solution of benzidine and a few drops of concentrated nitric held are added to the plain paper strip

In the Medical Journal and Record, I described my simple method for Quantitative Analysis of Gastric Content As shown by the following series of equation, I evolved the standard readings shown below

3 cc of N/10 NaOH is required to neutralize 10 cc of gastric content giving the final rending for free reid in 100 cc of gastric content as F 30

- (1) or 60 mm of N/10 NaOH is req to neut 10 cc of gas con giving  $\Gamma$  30
- (2) or 6 min of N/10 NaOH is req to neut 1 cc of grs con giving f 30
- (3) or 6 min of N/10 NaOH is req to neut 20 min of grs con giving F 30

		INTER	PRETATION	OF READING	S	
	(Toepfer's Solution) strip	(Phenolph- thalein) strip	(Blue Litmus) strip	(Sat. Sol. of Benz.) strip	(Plain paper) strip	Indicates
Reading 1	Red	No change	Pink	No change	No change	Free and combined acid present; blood and bile absent.
Reading 2	Red	No change	Pink	Blue	First blue or green, then red	Free and combined acid present; blood and bile present.
Reading 3	Orange-yellow (no change)	No change	Pink	No change	No change	No free acid present; acid medium, prob- ably combined acid; no blood or bile present.
Reading 4	Orange-yellow (no change)	Scarlet	Blue (no change)	No change	First blue or green, then red	Alkaline medium; no free, combined or other acids present; bile present (indicates regurgitation from duodenum).

(4) or 3 min. of N/10 NaOH is req. to neut. 10 min. of gas. con. giving F 30.

(5) or .3 min. of N/10 NaOH is req. to neut. 1 min.

of gas, con, giving F 30.

(6) or 3 min. of N/100 NaOH is req. to neut, 1 min. of gas. con. giving F 30.

(7) or 1 min. of N/100 NaOH is req. to neut. 1 min. of gas. con. giving F 10.

Now, substituting N/200 NaOH for N/100 NaOH in equation 6 we get:

(8) 6 min. of N/200 NaOH is req. to neut. 1 min.

of gas. con, giving F 30.

(9) or 1 min. of N/200 NaOH is req. to neut. 1 min. of gas. con, giving F 5.

Again substituting N/200 N/400 NaOH for N/100 NaOH in equation 6 we get:

(10) 12 min. of N/400 NaOH is req. to neut. 1 min. of gas. con. giving F 30.

(11) or 1 min. of N/400 NaOH is req. to neut. 1 min. of gas. con. giving F 21/2.

Summarizing the results obtained in the above series of equations, with especial reference to equations 7, 9 and 11, it is evident that every time we use one minim of N/100 NAOH in neutralizing one minim of gastric content it is an indication that free acid is present in the content to the extent of ten c.c. in one hundred c.c. of content or F equals ten; in like fashion, every drop of N/200 NAOH used indicates the presence of five c.c. of free acid in one hundred c.c. of gastric content.

It will be noted that in the above series there were used minims each of which was 1/20 of c.c. in size. The standardicity of the readings does not, however, depend upon the fact that this particular size minim was used but holds true for any size minim provided that the same size minim is used for measuring the gastric content as is used in applying the neutralizer. Briefly, this method ascertained the quantity of free and total acid contained in the specimen in the following manner: One drop of the gastric specimen was placed in a paper tray. If the examiner were testing for Free Acid, he would add a drop of Toepfer's Solution to the drop of the gastric specimen and then proceed to neutralize with the different utralizer (N/100 NAOH, N/200

NAOH and N/400 NAOH) as required. Fig. 2). Thus, if it required 3 drops of N/100 NAOH and one drop each of N/200 NAOH and N/400 NAOH before the specimen acquired the yellow color sought for, the reading for free acid in 100 c.c. of the specimen would be Free Acid equals 371/2. If the examiner were seeking to determine the Total Acid contained in the particular specimen under examination, he would take another clear drop of the gastric specimen, place it in a new paper tray and proceed as follows: After the addition of one drop of Phenolphthalein, the examiner then proceeds to neu-

FIGURE 2

tralize with the various strengths of NAOH as required until the scarlet color is obtained in the specimen. Thus, if after adding one drop of Phenolphthalein to the specimen, 5 drops of N/100 NAOH, 3 drops of N/200 NAOH, and one drop of N/400 NAOH were used to obtain the scarlet color, the reading for Total Acid in 100 c.c. of the specimen would be T equals 671/2. It must be again emphasized that the standardicity of the readings used in this method does not depend upon the use of pipettes which deliver 20 minims to the c.c. but rather upon the fact that no matter what size minim has been used by the examiner he has taken care that the same size minim was used throughout the entire test.

For use in conjunction with the Analytic Bucket, I have prepared special booklets (Fig. 3), containing strips of Toepfer's Solution, Phenolphthalein, Blue Litmus, Saturated Solution of Benzidine and also plain paper strips. Since each of the above-mentioned strips is of the same size and made of the same kind of paper, it is possible to find a standard saturation point which will enable us to determine the quantity of liquid contained in each strip after it has been introduced into the stomach. In order to correlate our findings in this regard with the standard readings used in the above-mentioned method, it will be

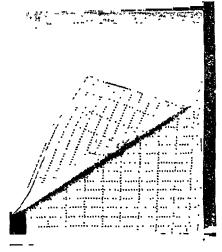

FIGURE 3

necessary to measure the saturation point of these strips in the same size minims used in that method. In the illustration of the Simple and Rapid method which is given in this article it will be noted that the minims which were used measured 20 to the c c. Using the same size drops in determining the saturation point of these strips, I have found that one minim of the above-mentioned size will saturate (Six) strips. Hence, each strip when saturated will contain (One-Sixth) of a minim. Thus the index for these strips when drops, measuring 1/20 of a c.c. are used throughout the test, is (Six). Now, the examiner can proceed and use the Simple and Rapid method directly upon the test strip itself for knowing the amount of specimen contained in the strip under examination, he can multiply the readings he has obtained by the appropriate index for the particular size

minim employed (in our illustration the index is Six) and thereby obtain a quantitative analysis of the gastric content without removal of speci-After considerable experimentation, I have evolved the following indices for the size minims enumerated below.

Index for pipette which delivers 20 minims per cc. is Six (6) Index for pipette which delivers 16 minims per ce is

Method A. To Determine the Amount of Free Acid. After the Analytic Bucket has been removed from the stomach and the qualitative analysis has been made according to the table given above, the examiner proceeds to determine the amount of free acid in the gastric content in the following fashion The strip of Toepfer's Solution is removed from the bucket and inserted in a small tray The examiner then adds drops of the different strengths of neutralizer as reguired (N/100 NAOH, N/200 NAOH, and N/400 NAOH) and notes how many minims of the different neutralizer were necessary in order to make the Toepfer's Strip regain its yellow color. The number of drops of neutralizer used are then multiplied by the appropriate standards as shown in the series of equations given above. Having obtained the readings according to the Simple and Rapid Method, the examiner then multiplies the index appropriate to the size of minim delivered by the pipette which was employed and the results obtained are the final figures for the amount of Free Acid in the speci-To give an actual illustration, suppose that one minim of N/200 NAOH and one minim of N/400 NAOH were applied to the Toepfer's Strip before it regained its yellow color. According to the standards given above, the reading for Free Acid would be 71/2. However, in this illustration, we used pipettes which delivered 20 minims to the c c The index for this size minim is six (6) and applying it to the preliminary reading, we learn that the Free Acid in 100 c.c of the specimen equals 45 The amount of Total Acid is determined in the same fashion as it was applied to the amount of Free Acid, except that the neutralizer is now applied to the Phenolphthalein strip, until the scarlet color is obtained.

SUMMARY: This method presents a means of obtaining a quantitative and qualitative analysis of the gastric content without removal of any specimen.

#### EDITORS AND PREACHERS

The position of medical editor is similar to that of a minister in a church. The easiest form of preaching is that of condemning defects and But calling the Devil bad names does not promote spiritual health among church members. The modern minister of the Gospel practices preventive theology by promoting an active immunity to the Devil.

Physicians have little need for condemnatory journalism, for they are already acutely aware of their defects and short-comings; but they respond to constructive appeals, such as those of the officers and committees of the Medical Society of the State of New York, to increase their own efficiency, so that they may provide all the forms of medical service that the people need.

#### HEALTH SERVICE TO COLLEGE STUDENTS

The Tenth Annual Meeting of the American Student Health Association, held on December 30 and 31, 1929, in the Hotel Astor, New York City, was an event of great importance to the medical profession of New York City. The Medical Society of the State of New York, in common with most other state societies, is trying to educate the people along medical lines. They do this directly by personal contact with their patients. They also do it indirectly by their contacts with the departments of Health and Education: with Tuberculosis and Public Health Associations and other lay organizations; with newspapers; and through their own medical periodi-But college students probably have more potential influence than any other group; yet little is heard of medical work in the colleges. Cornell University has developed an efficient health service through over ten years of experience. University of Michigan also has an efficient health service, and its Bulletin of September 11, 1926, entitled "Health Service in American Colleges and Universities" is an excellent review of the subject. Yale, too, has an efficient health service. But the medical societies of the states and counties have taken very little interest in the matter. The Ohio State Medical Society, however, has taken up the matter of student health service in the Ohio State University.

The argument for student health service is twofold—it is of immediate benefit to the students, and is of great future benefit to the public.

At first thought it would seem that the students of colleges have sufficient intelligence to take care of their own health, but such is not the case. They are young and vigorous, and their slight ills are subject to prompt recovery. On the other hand the students expose themselves to dangers on the athletic field, and to late hours and other influences which use up their strength. No matter how much Latin and mathematics they may know, they are usually ignorant of their own bodies, and many are filled with apprehension and misinterpret their feelings. There are many psychopathic states among college students, even among those in West Point. They consult a doctor in late illness. They take their health advice largely from physical trainers who prescribe only exercise and fresh air indiscriminately to all comers. Every college has need of an organized health service directed by the college authorities.

What form of health service does every college student need? In the first place the sick need care. The infirmary for bed patients is as necessary as a chemical laboratory for the scientific student. The college also needs a dispensary for the diagnosis and treatment of walking cases, with a doctor there at a certain hour every day in order to give prompt service. The ideal dispensary

sary is for the detection of incipient diseases, and the doctor will encourage patients to consult him for ailments which seem trivial in order that he may interpret them to the student, and also detect diseases in their earliest incipiency. Where a dispensary is established, it is used by the students, even to the extent of three or four calls per year per student. These contacts, trivial though they may often be, afford excellent opportunities for educating the students in scientific medicine. Then, too, the records of each indivirual will be a valuable help to the student in interpreting his future illness.

The service to the sick will necessarily be personal. Some students will tend to monopolize the time of the doctor while others will not go near him at all. But the success of the personal service will depend on the readiness of the college

physician to give the service.

The second form of student health service is the physical examination of every student. The older form of the examination was for the purpose of detecting evident defects in order to exclude the unfit from athletic games. The newer form of examination is for the purpose of detecting physical defects and tendencies to sickness. It cannot be done in a cursory way, but the examination of each student will require at least a half an hour. This service will cost money, but it is necessary if health service is to be of much benefit to the student aside from the care of his health when he is actually sick.

The record card of the physical examination will also be available for recording his ailments as he visits the dispensary. In four years the record will be a valuable reminder of the health conditions which the student will probably encounter throughout life.

The third form of student health service is that of general instruction. Students will not know what the health examination is all about unless they are told in a logical, consecutive manner. The health service will not be complete without class-room instruction. Cornell requires every student to attend classes for a year. Text books are used, lessons are assigned, and examinations are required. The course includes both personal hygiene and community health service. The college is used as a laboratory for the demonstration of sewage disposal, water purification, milk control, food inspection, and the heating and ventilation of buildings. The social side of medicine is also taught, including the relations of societies to the boards of health and to lay organizations, and especially to public health education.

The results in Cornell demonstrate the great value of the class-room instruction. The students understand what the dispensary service means to them, and they consult the doctors with intelligence. Moreover, when these students graduate and engage in business or the practice of their profession, they know what public health service means, and will be ready to support it in their future communities.

There has been little interest shown by general practitioners in student health. The Ohio State Medical Society is almost a pioneer in taking up the subject, and it confines its activities to the

State University.

A sufficient reason for the interest of the State Medical Society in student health is found in the personal service to the student; but a far greater reason is that of the effect on the medical education of the people. Every State Medical Society is trying to tell the people about medical service by means of lectures, writings, demonstrations, newspapers, and all other available forms of ad-

vertising and publicity. Here is an opportunity to educate the future leaders of communities. It would seem that if a State Medical Society were planning to reach as many people as possible in the most effective way, it would seek a group of future leaders and educate them rather than trying to reach the great mass of people directly. New York State has at least 30 important colleges with 50,000 students, which means that at least 10,000 intelligent leaders are added to the several communities of the State each year; and each graduate can be a cepter of community influence. It would seem that the Medical Society of the State of New York is presented with an opportunity to utilize the group composed of the most intelligent people of a community who are now receptive to instruction and who will be the future leaders in all civic lines.

#### DR. C. FLOYD HAVILAND

Dr. Clarence Floyd Haviland, aged fifty-four vears, one of the outstanding medical leaders in New York State, died on New Year's day in the Anglo-American Hospital in Cairo, Egypt, from acute influenza and broncho-pneumonia. Dr. Haviland was noted for his friendliness as well as his skill in psychiatry, especially along

administrative lines. Practically all his life was devoted to the service of the State in the Kings Park and Ward's Island Hospitals, except for a term as chairman of the State Hospital Commission. His father, hale and hearty at the age of eighty-six, still practices medicine in Fulton, N. Y.

#### LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Pure Milk: Twenty-five years ago the campaign for pure milk was just becoming efficient, as is shown by the following editorial from this

JOURNAL of January, 1905:

"The Health Board of New York, under the presidency of Dr. Thomas Darlington, is making vigorous war on the sellers of impure milk. No milk can be sold in the city without the permission of the Health Department, and the source of the milk supply being known, it is essential to know the character of the dairies. Special agents were sent to Blooming Grove, Orange County, and they visited the dairy owned and operated by the Metropolitan Milk and Cream Company. They found the floor of brick and stone dilapidated, puddle of dirty water in places, and the drainage broken or stopped up. The ground about the creamery was saturated with filth and had an offensive

odor. There was dirty water in the milk-room tanks, the water for washing the cans was taken from a spring in the center of the buildings, and a horse was stadled in one of the rooms of the dairy. Cans marked buttermilk were examined and found to contain skimmed milk and water. Several bottles containing a preserving fluid were, on analysis, found to contain formaldehyde. The Department of Health revoked the license of the Metropolitan Company. In connection with securing pure milk in the large cities of the State, Dr. Darlington has held several conferences with Dr. W. C. Greene, of Buffalo, to extend the system of examination and control of the dairies supplying milk to the dealers in the large cities. It is expected to carry forward the work among the cities of the second class, and thus practically cover all milk supplies.

## MEDICAL PROGRESS

Relationship Between "Strumous Buboes" and Lupus of the Vulvoanal Region .- Professor W. Frei, who was one of the first to differentiate lymphogranulomatosis inguinalis from chancroidal bubo, discusses the relationship of the former-which coincides in part with the strumous bubo and tropical bubo of older authors-with chronic elephantiasic ulcer of the vulvoanal region which in turn coincides largely with the clinical affection esthiomenus or lupus of the external genitals. His conclusions are as follows: The condition now known as lymphogranuloma inguinale is shown to be entirely specific and a positive seroreaction is decisive. But should the reaction turn out to be negative we cannot at once make a diagnosis of chancroidal bubo, for certain circumstances tend to vitiate the test. No proof has ever been submitted that a chancroidal bubo can simulate a strumous bubo. The author is equally outspoken in connection with esthiomenus. Although others have also advanced the hypothesis that lymphogranulomatosis and chancroid might be at the bottom of the lymphatic obstruction which has been thought to make possible the formation of esthiomenus he accepts this view only as it applies to the former and not in any sense to chancroid. No proofs have ever been submitted that chancroidal bubo may be responsible He now has a material of for esthiomenus 13 cases, of which number, two are quite recent, in which clinical esthiomene of the vulvoanal region has given the seroreaction of lymphogranulomatosis. Thus far he has found no case which gave a negative reaction. Of great importance is the fact that lymphogranulomatosis can destroy the inguinal lymphatics and cut off the lymphatic circulation without any clinical manifestations, which would explain why in esthiomenus no trace of past buboes may be present. Finally in regard to including syphiloma anorectale in the esthiomenus group the author has thus far seen no case of the latter which gave the lymphogranulomatosis reaction.-Klinische Wochenschrift, October 29, 1929,

The Treatment of Chronic Rheumatism.—Maurice Davidson, writing in the Practitioner, November, 1929, exxiii, 6, emphasizes the importance, in any attempt at methodical investigation of a patient complaining of painful symptoms referred to the joints or connective tissues, of remembering the possibility that the cause may be found in some generalized constitutional disease or in some gross organic

lesion in a region of the body other than that to which the pain is referred. In dealing with focal infection, wholesale extraction of teeth is to be deprecated By extraction of one or two teeth suspected of being the chief offenders, with careful clinical observation of any subsequent effects, one may gauge the amount of further interference, if any, that may be necessary. The same caution applies to the maxillary antrum, ethmoid, etc. Vaccine therapy has undoubtedly a place in the treatment of arthritis and kindred maladies. cific immunization is uncertain in its action but true specific immunization by means of carefully prepared autogenous vaccines is likely to yield more satisfactory results, although it involves greater attention to detail than is accorded by most pathologists. On the whole, drugs are of little permanent value, though thyroid extract is of some value in chronic arthritis at the period of the menopause, and likewise French tincture of iodine is useful in some cases. Good results have been reported from the intravenous injection of various organic combinations of sulphur and other substances, such as contramine and intramine. The author has been more encouraged by the results of intravenous injections of sodium salicylate in physiological saline solution. The dose is usually from 10 to 30 grains of sodium salicylate, dissolved in 10 c.c. of sterile saline, repeated at intervals of a few days. The element of mechanical strain is often a factor in the aggravation, or possibly even the production, of chronic affections of the joints and fascial structures. It is thus highly regrettable that the orthopedic surgeon is left out in serious attempts at team work in the investigation and treatment of rheumatic affections.

Apparent Cure of Noma by Insulin Injections. — Dr. Meltzer, medical director of a hospital in Rumania (Brezoi-Valcea), struck by certain resemblances between the disease pictures of diabetes and noma, such as moist gangrene and toxic coma, tested insulin in a case of noma of the cheek in a young infant, and the result was excellent. The patient was a nursling, one of twins, but its fellow had succumbed on the fifth day post partum of congenital debility. The family were living under poor sanitary conditions, but the child, breast fed, had been well up to the time of supervention of the noma. When first seen the lesion on the left cheek which had begun a week before as a black seab, was now an ulcer with a sanious offensive discharge. The child

was small and dystrophic, but appearently free from any other mischief. Treatment consisted at first of ordinary antiseptic dressings. Two days later the temperature had risen to 30 3C. (103.0°F.) and the child had severe diarrhea, vomiting, and coma, while the gangrene was spreading. Twenty units of insulin were now injected and repeated the following day. Improvement was evident by the third day as all of the general symptoms had subsided while the progress of the gangrene seemed checked. Insulin was continued every other day in small dose and the ulcer began to granulate. A good recovery was made although the patient a girl will show a bad scar with a certain amount of ectropion of the left lower evelid but a plastic operation will be performed to correct the deformity. The author is well aware that noma sometimes heals spontaneously but in this case the state of the child appeared hopeless when the drug was exhibited. The local treatment was of the simplest kind-a mere dressing with bismuth subgallate ointment.—Deutsche medizinische Wochenschrift, Oct. 25, 1929.

The Diagnosis of Acute Food Poisoning.— William G. Savage, in discussing the causation and clinical problems of food poisoning, classifies the causes as follows: (1) Food may be contaminated with comparatively simple chemical substances, such as zinc arsenic, copper, and the alkaloids. (2) Poisoning may result from foods inherently poisonous or which become poisonous under certain conditions, such as mushrooms, poisonous berries, and the tropical and other poisonous fish. (3) It may be due to the toxic action of certain bacteria, such as B. botulinus, Salmonella species (aertrycke, enteritidis, and other types), and dysentery bacilli. determinate bacteria or their products may be responsible for possibly 25 to 35 per cent of the cases which are at present unexplainable. There is no evidence of any value that putrefactive changes in meat or other foods has ever caused an outbreak of food poisoning, although it is possible that the consumption of incipiently putrefactive food might disagree with individuals. B. proteus has often been credited as the cause of food poisoning, but in nearly all instances the evidence is worthless, though this bacillus cannot be entirely excluded. Ptomaines are late protein degradation products never found in food until it is far too nasty to eat. They have nothing to do with food poisoning, and should be relegated to the limbo reserved for unfounded esses. Most the chemical poisons cause but usually have a than bacterial poisons.

vomiting are absent,

constipation

as are visual

disturbances, throat symptoms, and general muscular weakness; the temperature is generally subnormal. This type has the longest incubation period (18-36 hours). In Salmonella food poisoning acute diarrhea, severe vomiting and abdominal pain are invariably present, other symptoms being a rise in temperature, cramps, and subsequent prostration. The incubation period is usually from two to four hours. The fact that some members of a group escape an attack, even if they all consume the same food, does not of necessity invalidate a food hypothesis, but it is unlikely that a food consumed by several persons should make only one of them violently ill. Food poisoning must sometimes be differentiated from influenza of the gastroenteric type.—The Lancet, November 16, 1929, ccxvii, 5542.

Endocrine Keratoconus Corrected by Pluriglandular Opotherapy.—Drs. W. and A. Meerhoff and J. Montes Pareja, of Montevideo, report this case. They have studied seven cases of this affection, which an authority such as Fuchs has declared progressive and incurable, and have found in each some endocrine anomaly. The first patient was a boy of 14, vision normal up to the age of 8 when a high degree of myopia developed and was not corrected by glasses. There was recognized by the authors a bilateral keratoconus, worse to the left. The boy showed also anomalies of growth, was very fat, genitals atrophic, defective development of hair aside from the scalp. A hypophyseal tumor could be excluded as a causal factor and there was no confusion of sex apparent. The diagnosis was Froehlich syndrome or adiposo-genital dystrophy, with marked mental infantilism. The incretory organs which showed insufficiency included thyroid, adrenals, gonads, pituitary, and possibly the thymus. Pluriglandular therapy was given. Three months later vision had improved somewhat for both eyes without correction with glasses. At no time were lenses of service. The boy became able to read and study. At the same time the adiposogenital syndrome showed proportionate improvement. There was no other treatment of any sort. A coincidence seems out of the question and the conclusion must be reached that the dystrophy of the eye was in this case at least a part of a general endocrine syndrome of deficiency. hitherto incurable deformity of the eye has yielded to treatment and without the least aid from lenses. The publication of the other six cases will be awaited with interest although it is expecting too much to anticipate that all will respond to the same treatment in the same manner.—Revue française d'Endocrinologie, Oct., 1929.

Scarlatina and Nephritis.—According to Prof. Huebschmann of Düsseldorf this subject, once thought a simple one, has become increas-

anticipate the possibility of a parenchymatous uephritis or nephrosis, but at least two forms of actual nephritis have been isolated as scarlatinal -glomerular and interstitial. There may also be transitional forms, but in most cases either one or the other is typically represented. There are two forms of interstitial nephritis-diffuse and focal. The author has worked on this subject since 1911 and has paid particular attention to the presence or absence of leucocytes, eosinophiles plusma cells, etc., for upon such a basis have attempts been made to distinguish between different forms of nephritis Autopsies on subjects in the earliest stages of nephritis are naturally rarely obtained, and these histological criteria are worth little in the absence of knowledge as to the stage of the disease Differential diagnosis from urine examination is not yet sufficiently cleared up Clinically interstitual nephritis is chiefly a com plication, an early form, while the glomerular form is more apt to be a sequela or late manifestation The author can explain the pathogene sis only on the toxin assumption-the endotoxins of the bacteria and chiefly the streptococci. The peculiar interstitual nephritis of scarlet fever is in the opinion of the author the true type of scarlet fever nephritis, the glomerular form might occur as a complication of other acute gen eral infections. But the author regards cases of nephritis seen after anginas and diphtheria as examples of the interstitial form and closely related to typical scarlet fever kidney. The kidneys in scarlet fever must have some special sensitiveness or allergy toward the toxins of the strepto coccus and probably of other microorganisms It may be shown in time that the disease is not due to the streptococcus, which may be only a secondary offender -Klinische Wochenschrift, November 26, 1929 The Treatment of Electric Burns by Immediate Resection and Skin Graft -Donald B

ingly complex. In any general infection we may

Wells outlines the differences between electric contact burns and all other types of burns. The heat which produces an electric burn is far more intense and usually acts for an infinitely shorter period of time. The pathological picture is, therefore, radically different from that of other types of burns Third degree electric burns are always sharply circumscribed, with a central area of necrosis extending well down into the subcutaneous areolar tissue, often including muscle and tendinous structures These burns usually progiess to gross sloughing and exuberant granula tion, with healing unduly tedious and prolonged In the treatment of gunshot wounds during the World War the procedure known as debridement and primary suture was developed and perfected This principle seems not to have been applied to burns During the past three years Wells has employed it in the treatment of a small series

of electric burns, completely resecting the burned area and closing the wound either by primitry suture or immediate application of a skin graft With this procedure there is great saving of suffering on the part of the patient, a material shortening of the period of disability, and ultimate conservation of the functional capacity of the injured part — lunials of Surgery, December, 1929, ic, 6

Pyemia vs Sepsis -M Martens points out that these two terms are used in a loose fishion although the two processes are radically distinct In the past authors have stressed the various differences but often to little purpose Pyemia originates in the venous system as a thrombo phlebitis while with sepsis the propagation is through the lymphatic system. There is no pyemia without this initial purulent thrombophlebitis and no genuine sepsis with it Cases of the double transmission probably occur but have not been proven and the term septicopyemia means as a rule that we do not know the original focus In pyemia the purulent thrombus breaks down and the blood is flooded with pus which originally gave rise to the word pyemia. There is an inter mittent fever with chills and sharp rise, and metastases will occur unless we can tie the veins in season. Any other plan of treatment is absolutely worthless, and this includes surgery how ever radical which does not care for the veins. and when ligation does not have the desired result it is because the intervention is too late or certain vems are overlooked. To refuse to operate early in these cases is a sin of omission. The greater part of the author's paper is devoted to pyemia with citation of many statistics, but it would have been of unusual interest had he adhered to outliming a parallel throughout with cases of sepsis The latter is a condition which can be treated with a great variety of general measures, such as cold baths, antipyretics, feeding, the use of sera, etc, all of which, as has been stated, are not only of no value in pyemia but hold out a specious hope of recovery. There is, however, one point which must not be overlooked for when pyemia has done its fatal work the patient is actually septic, that is has a bacterio toxemia, and sepsis is the actual cause of death in such cases —Deutsche medizinische II ochenschrift. Novem bei 1, 1929

Increase in Thrombosis and Embolism—The increase in these conditions noted in recent years and notably after surgical operations has been hastily attributed to the increasing use of intravenous injections but H Schleussing of Dusseldorf, who has made an extensive statistical research into the incidence of these complications is certain that no single cause can be assigned His figures extend from 1911 to 1928. Thrombosis is shown to lave been more common in 1911.

and 1912 than for many subsequent years. Then in 1926 there was a notable increase, while in 1927 and 1928 the percentage of thrombosis found at autopsy had reached 17 from a minimum of about 6. No such increase was found for embolism but in the interval 1926-8 inclusive it was decidedly more common than in the preceding years. Fatal embolism began to increase in 1924 in a similar manner. The author also has a contrasting table of cases treated by internists and surgeons. The number of cases in the internist wards shows a notable cumulation since 1927 as far as numbers go, but the percentage This applies to both shows no such change. thrombosis and embolism, and the same may be said of the cases developing in the surgical wards. In regard to absolute frequency the medical cases are increasing while the surgical ones show rather a decline; and this difference ought to throw light on the causal factors. A study of the incidence of these complications over many years shows first of all marked annual variations. A study of individual locations will show that fatal embolism of the lungs, for example, varies much in annual incidence. Thrombosis as stated was very common in 1911-2, at which period very few intravenous injections were practised. In 1924-6 before the increased incidence one half the patients had been subjected to intravenous injections which is a somewhat higher figure than that of the period 1927-8 (50% as against 43%),—Klinische Wochenschrift, November 12, 1929.

Pneumococcal Infections.—C. H. Whittle, writing in the British Medical Journal, November 16, 1929, ii, 3593, reports observations which confirm the main conclusions which he reached last year. He finds that primary lobar pneumonia and empyema due to pneumococci are invariably caused by strains of high virulence. In the period under examination (1924-1929) 70 per cent of the strains occurring in pneumonia, bronchopneumonia, and empyema belonged to Type I. In the first three months of 1929, there occurred in Cambridge a number of cases which were diagnosed as of acute bronchitis and presented rather unusual symptoms. Though there were no physical signs of lung consolidation, the prostration, severity, and length of the illness, and the persistent cough with copious sputum, suggested some involvement of the alveoli of the lung. In the sputa of five of these patients pneumococci belonging to Type II and Type III were found. These strains, which showed a lower order of virulence than the lobar pneumonia strains, were able to set up a particularly toxic form of infection of the bronchioles, which probably extended to patches of lung too small to be differentiated from the rest by auscultation and percussion. Hence a clear dictinction must be drawn

o grow in the aborate toxin.

The task of converting strains of low virulence. recovered from cases of nasal catarrh, conjunctivitis, and bronchitis, into those which are sufficiently virulent to set up lobar pneumonia in healthy subjects was again attempted and again proved impossible by any known experimental procedures for raising virulence. By the introduction of pneumococci of moderate or feeble virulence into the peritoneal cavity of mice a condition of subacute otitis media with involvement of the semicircular canals has been set up. The condition bears the closest resemblance to the spontaneous otitis media occurring in laboratory rodents. Though the pathology of the infection has not been worked out in detail, it is clear that the pneumococcus has a special predilection for the middle ear both in man and in the mouse.

Pathology of Arteriosclerosis .-- W. Ceelen, pathologist of the University of Bonn, distinguishes three forms of this affection, 1. genuine; 2. calcification of the media, and 3. a peculiar hyaline-sclerotic alteration. A knowledge of normal histology and of certain experimental data is necessary to visualize the disease. If the blood pressure is notably lowered for a length of time the intima undergoes proliferation until the vessel is obstructed. If the same vessel is the seat of increased tension we also see a proliferation of the intima which becomes thickened. There is, however, a marked range of individual variation, due probably to the fact that numerous other factors enter into the pathogenesis, such as alimentary, toxic, nervous, etc. In addition to the hyperplasia of the intima the latter is exposed to lipoid degeneration. Arteriosclerosis then contains two distinct and opposite elements, hyperplastic or progressive and degenerative or regressive. Genuine arteriosclerosis is thus an affair of the intima. In calcification of the media we are dealing with an entirely different type of disease, and one commonly associated with senescence, senile gangrene, etc., although the same condition may be seen in the diabetic. Certain arteries, as the popliteal and tibial, are predisposed to this form. Obliteration, thrombosis, etc., are also prone to occur in this form. The third type is seen especially in the kidneys and in renal arteriosclerosis in general. Naturally this summation of the author leaves many important questions untouched, among them cerebral and cardiovascular sclerosis, so important clinically as causes of death. To sum up, the first type might be known as scleratheromatosis, illustrating both progressive and regressive lesions of the intima; calcification of the media in senility and diabetes. and the predominantly renal lesion which may be called sclerosis of the smaller arteries-arteriolosclerosis-which for the most part is associated with high tension pulse and cardiac hypertrophy. -Deutsche medizinische Wachenschrift, November 18, 1929.

## LEGAL

By LLOYD PAUL STRYKER, ESQ. Counsel, Medical Society of the State of New York.

#### MALPRACTICE LIMITATION STATUTE HELD NOT APPLICABLE TO NURSES

A claimant in the ordinary personal injury action based upon the negligence of a party has, under our law, a period of three years within which to commence his action. The legislature, however, has wisely determined that certain actions must be begun within two years. Among the actions which must be begun within two years is an action for malpractice.

There was recently presented to the Supreme Court for decision an extremely interesting question involving the definition of "malpractice" as contained in the statute of limitations regarding malpractice, to which reference has already been

made.

An action was commenced against a nurses' employment bureau and a registered nurse. The charge against the nurses' agency was breach of warranty based upon the claim that the agency had represented that the defendant nurse was "able, competent and skillful," and that the plain-tiff employed the defendant nurse on the strength of that representation. The complaint further charged that such representations were, and were known to be false and untrue, because the defendant nurse was not an able, competent and skillful nurse, but had been and was suffering and disabled by shell shock.

The complaint further charged that the defendant nurse treated the plaintiff in a careless, reckless, incompetent, negligent and unskillful fashion in that, while the plaintiff was in a hospital under a doctor's care, the defendant nurse placed a hot water container against the limbs of the plaintiff at a time when the plaintiff was unconscious, and allowed the container with the hot water therein to remain on the limbs for such a length of time that the plaintiff's flesh was severely burned. It was further charged that the ailment from which the plaintiff claimed the defendant nurse was suffering, to wit, shell shock, rendered the defendant nurse nervous and forgetful, and because of this she could not properly care for the patient as a nurse.

It was conceded that the action was not commenced within two years after the nurse had last treated the plaintiff, although there was some question as to whether or not during those two years the nurse was available for service of process on behalf of the plaintiff. That situation, however, is not material to the question treated

in this editorial.

After the service of the complaint, the attorneys representing the defendant nurse made a motion to dismiss the complaint, contending that the action against the nurse was one for "malpractice" within the meaning of the statute requiring that an action for malpractice must be begun within two years. The lower Court dismissed the complaint as to the defendant nurse, sustaining her attorneys' contention that the action against her was one for maloractice and hence barred by the statute of limitations. From that ruling the plaintiff appealed to the Appellate Division.

The question before the appellate Court was "whether or not the carelessness and negligence of a nurse in her professional employment may be considered as malpractice." The Appellate Division reversed the lower Court, and held that the meaning of the term "malpractice" in the statute was limited to physicians and surgeons, and did not include actions brought against a registered nurse for claimed negligence in the treatment of a patient. In the opinion of the Appellate Division it was held that the law should be interpreted as follows:

"In any event, with respect to the main question, we conclude that malpractice is to be considered in its primary meaning, and as generally understood by the ordinarily intelligent and reasonably informed person, and in this respect, according to such common usage and acceptance, it has continuously been intended to import an improper treatment or culpable neglect of a patient by a physician or surgeon. As an added significance it has been used to indicate a corrupt or culpably incompetent practitioner of either law or medicine, but in no instance is it found to have possible application to a nurse, nor is there anything in the test of this complaint which indicates that the gravamen of the action is other than the negligent conduct and reckless, careless and incompetent performance of common duties of a person engaged in an employment for such specified duties as distinguished from lack of or improper performance of work requiring purely professional skill."

Thus, the Court squarely held that it would not extend the meaning of "malpractice" in the statute so as to include actions based upon the claune negligence of nurses in the treatment of the natients.

#### SYPHILIS-CLAIMED NEGLIGENCE IN INJECTIONS

In this case actions were brought by the husband and wife against the defendant. The negligence claimed was that the defendant did not properly diagnose the illness from which the wife was suffering, and further, that he treated her in such a negligent and unskillful fashion that he not only failed to cure her of the malady from which she was suffering, but in addition greatly aggravated and prolonged her illness. In the wife's case damages were prayed for in the sum of \$50,-000 and in the husband's case in the sum of \$10,000.

The doctor was called by the husband to see this woman at her home and gave a history of having pains in her legs and back, and suffering from indigestion. From the doctor's examination he determined it best to have an x-ray taken, and arrangemens were made for the plaintiffs to come to his office, which they did and an x-ray was taken. The doctor made a vaginal examination of the plaintiff wife and found a retroversion of the uterus. A blood test was taken and when returned it showed the presence of a syphilitic condition. To treat this condition, on three occasions thereafter the doctor injected neo-salvarsan, giving on each occasion less than one-half the full dose. After these injections another blood test was taken which, upon examination, showed that the syphilitic condition of her blood had cleared up. On the day of the third injection upon examination the doctor found upon the chest of the plaintiff wife a few small spots, which he describes as minute macules. About a week later, this condition which the doctor found had spread into a rash. For about a week the doctor continued to treat this rash with an astringent of zinc sulphate and calamin solution and other remedies. rash cleared up in spots, but was spreading to other parts of the body. The doctor could not account for this reaction other than the woman was an idiosyncratic. About this time the plaintiff husband called the doctor up and said that he need not come to see his wife any more, that she was going to a hospital. The doctor requested the husband to permit him to see the wife at the hospital, but he refused to do so; and the doctor never saw the woman again until these actions were commenced.

The plaintiffs after commencing the actions. however, took no steps to prosecute the actions and on our motion they were dismissed for lack of prosecution.

#### CLAIMED NEGLIGENCE IN TREATMENT OF BREAST

In this case an action was brought by the husband and wife against the defendant physician claiming that the defendant had been employed by them to treat and cure the plaintiff wife of a malady from which she was then suffering, to wit, infective mastitis of the right breast. The complaint further charged that the defendant examined the plaintiff wife and gave as his diagnosis that the right breast was in a normal condition, except for a sore nipple and advised that no treatment or medicine was necessary and refused to give any treatment or medicine to the plaintiff wife; that the defendant negligently failed to discover the true illness from which the plaintiff wife was suffering. Damages were prayed for in the husband's action in the sum of \$2,000 and in the wife's case in the sum of \$10,000.

The doctor was called in to see this woman. She complained of disability in her legs. An examination disclosed she had enlarged varicose veins of both legs and the legs were swollen. At that time she also informed the defendant that she was pregnant and requested him to attend her on delivery. The doctor prescribed for the varicose veins and also saw the woman several times and gave her pre-natal care. On the night the woman was delivered the doctor arrived at her ' ome about five o'clock in the afternoon and remaind there continuously until after midnight when the baby was delivered. It was an uneventful delivery. The doctor saw the woman and the baby for about three or four days and then he was told not to return unless they requested him to do so. About a month after the delivery the doctor was requested to go to the home of the plaintiffs and upon arrival he found the plaintiff wife complaining of a sore right breast. An examination disclosed that it was somewhat swollen, the nipple was cracked and tender, but the breast was not caked. The doctor pumped out the breast with a breast pump and massaged the same, and the woman told him that she felt much better. The doctor then instructed the woman's mother who was present to pump out the breast every two hours, to massage the breast and to put cold packs on, but he told her not to permit the patient to become chilled. He also told the people to let him know if the plaintiff wife's condition got worse. He also instructed them to get a glass nipple shield which would permit the baby to nurse, but not to let the baby nurse that breast for a day or two. The doctor never heard from them again.

Some time after the doctor's answer had been interposed, the plaintiffs discontinued the action

against the doctor.

# LONDON LETTER

Radium: The National Radium Fund, started in March, 1929, as a Thanksgiving for the King's recovery, has reached a total of £300,000 and, as a result, there will soon be a large increase in the amount of radium available for use by the medical profession. How best to utilize the new supply has been a matter for discussion. Its distribution is in the hands of the National Radium Commission which, under the Chairmanship of Lord Lee of Fareliam, is actively engaged on the problem. It has decided to recognize as Radium Centers only such places as possess Medical Schools with complete clinical courses, and the necessary facilities for instructing students and post-graduates in the principles and practice of radium therapy. The Commission hopes to allocate three grammes by the end of 1929 and a further seven grammes by October, 1930, in addition to the four gramme "bomb" on loan from the Belgian manufacturers which has been placed in the temporary keeping of the Westminster Hospital. This decision well accords with the report of the Committee appointed by the American Society for the Control of Cancer, published in the Journal of the American Medical Association. It is obvious that in both countries the need is felt for special training not only on the clinical side but equally on the physical, chemical, and biological sides of the whole Cancer problem; and to confine the use of radium-this potent, and if wrongly applied. dangerous adjuvant to the surgery of malignant disease-to the hands of those making a special study of its complex problems. It does not reonire a very vivid imagination to realize the danger of a trade association acquiring a large amount of radium and hiring it out at so much a milligramme to all and sundry. A very timely warning has been issued by the National Radium Commission emphasizing the dangers of exaggerating its healing properties or under-rating them. The case is most fairly stated and the conclusion that radium is a new weapon and a powerful one, but how effective it is impossible to say, sums up the opinion today of those best qualified to judge.

Buckston-Browne Dinner: I had the good fortune to be invited to the second Buckston-Browne dinner at the Royal College of Surgeons this week. The function originated in a desire by Mr. Buckston-Browne, a pioneer in urological surgery, to gather together at the College once a year an equal number of Fellows and Members of the College in a cheery gathering, and as is the custom

one hundred of us sat down to an excellent repast, and there was no after-dinner speaking, except that Lord Moynihan, President of the College, in welcoming the guests, mentioned that their host had acquired and presented to the College the country home of Darwin (where he wrote the "Origin of Species") which he hoped would be used by the College as a center for experimental research. The evening was a great success and there is no doubt that the desire of our host was amply fulfilled. The first person I saw after greeting my host was an old fellowstudent at Bart's, now in practice on the South Coast, whom I meet all too rarely, then a surgeon at Liverpool, then a general practitioner in the Midlands, and at the dinner table I sat next to two old friends, one from Bristol and the other from Cardiff. Everything was very jolly and informal, and of those present no one seemed to enjoy the evening more than Dr. Dixon, the oldest medical man in England, who at the age of 98 dealt faithfully with the dinner and a large cigar afterwards. The absence of speeches after the dinner did not seem to depress the company. A few days ago the Lord Chief Justice of England was telling us how at a Lord Mayor's Banquet he asked his neighbor, the Chinese Ambassador, whether after-dinner speaking was a custom in China. The Ambassador, gazing impassively at the somewhat prosy orator of the moment, said that it had not been thecustom for eight thousand years and was now a capital offense!

Recreations of Medical Men: The recent accident in the hunting field sustained by my friend, Sir William Willcox, the famous toxicologist, directs one's thoughts to the recreations of our eminent medical men. William is a keen horseman, and is one of the best known figures in the Row, where he is to be seen every morning at a very early hour, and Sir Richard Cruise, the King's Ophthalmic Surgeon, is constantly in the hunting field. But the severe curriculum of the medical student, and later the claims of practice combine to limit all too closely the medical man's opportunities of excelling at any sport. The late Dr. W. G. Grace devoted his life to cricket and has become the legendary hero of this typically English game. and of recent years Dr. Tweddell at golf and Dr Gregory at lawn tennis have reached the very top of the tree, but most of us are perforce content to follow our recreations less strenuously. An interesting story could be written round the recreations of the leaders of any profession, and perhans some day it will be done to

tionship now existing is an asset to the medical profession of the State and should be fostered and developed still more. These departments of the government of the State look to the Public Relations Committee for advice on occasion, and the Public Relations Committee must have some authority to express an opinion or else the medical profession will not have a part in many decisions because these decisions must be made promptly by the Department of Health or the Department of Education. If we are going to medically guide these departments in their decisions, they cannot wait in all respects for the action of the House of Delegates. Major things and major decisions can wait. Minor ones must be decided at the time. Though this may seem a departure, it is, nevertheless, essential; and the

Public Relations Committee believes that to withhold this power entirely is inimical to attaining the high position that the medical profession should attain in the councils of the health organizations of the state.

Dr. Ross also called attention to the gratification expressed by the official representatives of the State Departments of Health and Education that the Public Relations Committee would advise the Departments regarding medical matters that came before the Departments (See this Journal, February 1, 1929, pages 170 and 171).

On motion duly seconded and carried the Council approved the report of the Committee on Public Relations and the four principles suggested by Dr. Ross.

#### PUBLIC RELATIONS COUNTY SURVEY No. 9—RENSSELAER

This report is in the nature of a general survey of work already done, and work that should be done in the future toward the restoring, safeguarding, and preserving of health, by the medical and dental professions with hearty cooperation of several lay organizations.

Public Health Committee.—The Board of Supervisors at its December, 1928, meeting appointed a Public Health Committee of five members. This committee divided the county into four sections assigning a public health nurse to each section. In making this division the population, area, schools, school children, and physicians were considered.

The Public Health Committee holds its meeting once a month at which time the district sanitary supervisor and district nurses are present together with the secretary of the Rensselaer County Tuberculosis and Public Health Organization.

Tuberculosis Sanitarium.—Rensselaer County has a tuberculosis sanitarium known as the Pawling Sanitarium. In 1908 the Board of Supervisors of Rensselaer County appropriated \$25,000 for the erection of a county hospital to be used for the treatment of contagious diseases and tuberculosis.

The hospital was to be erected on county property adjacent to the Alms House, and to be under the management of the Superintendent of the Poor. Before completion the hospital cost approximately \$35,000 for construction and \$5,000 for furnishings.

At the time of opening of the hospital, which was August 9, 1910, there was such need for quarters for tuberculosis patients that it was decided to devote the use of the entire hospital for that purpose, and consequently contagious cases have never come under its supervision.

The hospital continued under the management of the Superintendent of the Poor until 1912, when by an act of the County Tuberculosis Hospital Law, it was reorganized and put under the direct control of a Board of Managers, appointed by the Board of Supervisors and on October 1, 1912, the newly appointed Board assumed control and the hospital was put under the management of a resident superintendent.

Soon after the organizing of Lakeview a movement was set on foot for a new sanitarium, as it was realized that Lakeview was inadequate to meet the demands of Rensselaer County. An active campaign was maintained until 1915 when the Board of Supervisors purchased a site of some 150 acres in the town of North Greenbush, one mile from the village of Wynantskill and two miles from the city limits of Troy.

The site cost \$11,500.00. No further progress was made during the next year, but in the fall of 1916 after a vigorous campaign, the people at a general election voted to appropriate \$156,000.00 for the erection of a tuberculosis hospital. In August, 1917, ground was broken and construction begun. Owing to the increased cost of all materials an additional \$150,000.00 was appropriated and, at final completion the cost was approximately \$328,000.00.

The institution comprises six buildings besides the superintendent's and assistant physician's cottages. The patient capacity is 182 beds. There is a separate pavilion for children—40 bed capacity. The institution is fully equipped for modern treatment of all forms of tuberculosis. It has a fully equipped x-ray and laboratory. The past fall provision was made for heliotherapy treatment. Artificial pneumothorax is performed on all suitable cases. Ultra violet ray treatment is also used with favorable results.

A part-time dentist is employed. There is also a consulting staff of physicians from the city of Troy. The sanitarium is an incorporated school district under the regulations of the State Department of Education and a full time school teacher is employed. It will be necessary to add another school teacher for the coming year. We also have a full time occupational therapist.

During the last year 168 patients were admitted with a total of 316 cared for during the year. This number included all stages and con-

ditions of tuberculosis.

Since January 1, the county has been under the generalized nursing plan and being more or less supervised by the State Department of Health. On the advice of the State Department of Health, the clinics are held under the so-called "consultation clinic" system, meaning that each patient before being admitted to the clinic must secure an admission card from his family physician or the health officer of the district and clinical reports are sent directly to the family physician. sanitarium has a portable x-ray and x-ray plates are taken on all patients examined. It is planned to hold frequent clinics throughout the rural section. During the short period that clinics have been held under the consultation clinic plan, they seem to have met with very favorable reception as the attendance has been large.

Chest clinics are held yearly in each township by the superintendent of Pawling Sanitarium and country health nurses for the early diagnosis of During the past year a portable tuberculosis. x-ray machine has been purchased which makes possible the detection of hilus tuberculosis in children, and, as most authorities concur that hilus tuberculosis is the seat of the primary lesion, much concentrated effort is being used along this line. Due to the increased number of hilus or juvenile cases discovered and admitted to the sanitarium, plans are under way for a new school building to be erected. Since 1907, according to statistics, the death rate of tuberculosis in Rensselaer County has been reduced 50%.

Hoosick Falls,—Hoosick Falls maintained by popular subscription a health center which recently has been re-organized and is fully equipped with modern operating room and maternity ward and will accommodate about fifteen patients.

Rensselaer.—In the city of Rensselaer there is a school nurse employed by the Board of Education, a public health nurse by the city and parochial schools, and through the Tuberculosis and Public Health Association, the schools are provided with a nutrition teacher.

Rural Sections.—There are thirteen health officers in the tural section, all of them having taken the course in public health. Every town in the country has a resident physician exception of Petersburg and Grafton w

a combined population of 1,800. There are twenty-five physicians in the rural sections outside the cities of Troy and Rensselaer. These physicians are so well distributed that every section of the country is well cared for.

There is one school nurse under the supervision of the Educational Department and the Renselaer County Public Health Organization. She works in conjunction with the county nurse in her district so that the work does not overlap.

There are 4,600 school children outside of the cities. An intensive campaign on the toxin anti-toxin immunization has been organized. Many defects have been corrected, such as removal of tonsils and adenoids, and attention to eyes and teeth. Orthopedic clinics and pre-school consultations are held by the State Health Department at intervals throughout the county.

Public health education has been stimulated by

literature, motion pictures and lectures.

Tuberculosis Associations.—The Rensselaer County Tuberculosis and Public Health Association, which is supported by a sale of tuberculosis Christmas seals, holds semi-weekly tuberculosis clinics at the health building, namely: on Wednesday from 6:30 to 9:00 P.M., and on Friday from 3 to 5 P.M. The staff includes a part-time clinician, Dr. R. H. Irish, and two full-time tuberculosis visiting nurses, one engaged by the Tuberculosis Association and one by the City Department of Health. There were 93 clinics held during the year 1928 with a total attendance of 482. On December 31, 1928, there were 267 patients on the clinic register, and 395 cases under the supervision of the nurses; of this number 310 were positive cases and 85 suspicious cases.

Psychopathic Clinic.—The psychopathic clinic, held at the Samaritan Hospital on the first Wednesday of every month, is under the direction of Dr. Clarence C. Cheney of the Hudson River State Hospital at Poughkeepsie, New York, and his assistants. This clinic is conducted for the parole patients from the State Hospital, or for anyone asking advice on any special problem. The interest that parole patients and their families have in taking advantage of this clinic is noted by the attendance each month. Very frequently when patients are unable to attend on account of the inclement weather, a telephone call or letter indicates the present condition of the patient since the last clinic. During the year 1928 there were 75 new cases admitted to this clinic. and 364 revisits from old cases. There are two doctors in attendance, and a social worker for the histories and field work.

Cancer Clinic.—The Cancer Clinic is conducted by the Rensselaer County Committee of the American Society for the Control of Cance. Clinics are held once a month at the Samuel cancer are made without charge, except in the case of x-ray films when the charge is reduced for those unable to pay. All patients, at the completion of the examination, are referred to their own attending physician and a letter is sent to him telling of the findings.

The examinations are made by the attending physicians at the hospitals who happen to be on

service at the time of the clinic.

The object of the clinic is to detect the presence of cancer as early as possible and to bring those cases under treatment promptly.

The funds to bear the expense of the clinic have been contributed by the Lions Club of Troy.

Troy Health Department.—The Board of Health for the city of Troy was superceded February 1, 1928, by the creation of the Department of Health headed by a Commissioner of Health appointed for a term of four years. The Health Commissioner is charged with the responsibility of Health activities in the city of Tuberculosis clinics were held twice weekly during the past year, a full time nurse is assigned to this line of work, working in conjunction with the Rensselaer County Tuberculosis Association. Child Welfare Clinics are held weekly at the New Health Center where children are examined and advised as to care and diet. This work is in charge of a physician and two full time nurses. Venereal clinic is held twice weekly and is in charge of a physician and a full time nurse. Prenatal Clinic is held twice monthly, a physician and a full time nurse being in charge. The special value of the nurse in these cases is that she is the authorized agent who is charged with the duty of securing the proper attention for the expectant mother.

Sanitary inspectors, whose duties consist of investigating nuisances and unsanitary conditions, and serve notices, thus relieving the health officer of the burden of the inexpert field work, were appointed. There are six sanitary inspectors employed in the city Troy; they are each given a district and held responsible for the conditions of that district.

In regard to communicable diseases, a full time nurse is assigned to this line of work whose duties are to investigate ail cases of contagion that come to the attention of the Health Department.

Laboratory.—A public health laboratory usually conducts six lines of work: 1. bacteriologic examinations, 2. chemical analysis, 3. the production of vaccines and serums, 4. field work, 5. research, 6. education. The greatest number of individual specimens received for examination and analysis in a public health laboratory are examined for the presence of disease germs, or the products of disease. The laboratory also makes bacteriologic examinations of water, sewage, milk, food, and air. The laboratory may also examine these substances on economic grounds, especially

if they have an indirect bearing on public health. Specimens of food are often examined for the detection of objectionable impurities and adulterations, and for lowered standards of composition; but the usual rule is that a laboratory of a department of health shall examine only those specimens which have a bearing on public health. It will examine all specimens sent by physicians from persons suspected of having communicable disease, or of being carriers of disease germs. Milk samples are taken twice weekly and are sent to the laboratory for the bacteria count and butter fat; and if they are found to be below standard an investigation is made to find where the real trouble lies.

Immunizations.—Toxin antitoxin clinics are held twice daily, the Department of Health acting in conjunction with the Department of Education. During the past year over 3,000 children were immunized. At present practically 90% of the children in the city exclusive of the parochial and private schools have been immunized. A clinic for crippled children is held once a week at the New Health Center and is under the supervision of a competent physician. This clinic is supported by the Elks.

Swimming Pools.—All swimming pools are inspected monthly. The importance of swimming pool sanitation should not be minimized. An increase in the number of sinus, ear, nose, and throat infections among individuals who make frequent use of swimming pools indicates that the proper methods for the control of such are not being carried out successfully or the right methods found. Bacteriological examination is generally made from the standpoint of gastric-While this is sufficient for enteric infections. drinking water, where water for swimming is being considered, the type of bacteria is more important than the relative number of bacteria it contains. The water in a pool during the time of swimming represents the combined washings of the nasal and mucus membranes of every swim-Therefore, some definite standards to render and keep the water in such pools safe for the swimmers is important if we are to prevent infections of the respiratory tract and paranasal sinuses. That is the reason why this city is so particular regarding swimming pools.

A Division of Vital Statistics is maintained to prevent disease and promote public welfare.

Plumbing Inspection.—There is need of plumbing inspection in our city. The subject of cross connections, the possibility of waste matter in the plumbing fixture finding its way back into the domestic water supply system, either by gravity or by syphonage, is a condition that may be serious. Preventive measures can be carried out efficiently only by a qualified sanitary pluming inspector. The point where a safe water supply ends and sewage begins is sometimes very finely

drawn A study of this question has produced conclusive evidence that plumbing has a close relation to health and that its installation, supervision, and inspection must be from a health, rather than building construction standpoint

District Physicians—Troy employs four district physicians who are assigned to the Department of Charities and are each given a district to take care of the poor of this city

Social Hygiene—The social hygiene clinic is conducted by the city of Troy, at the Health Building, Seventh Avenue and State Street I his clinic is under the charge of a physician and a graduate nurse

The clinic is conducted for the treatment of the social diseases, syphilis, gonorrhea and chaircroid in men, women and children. Only those patients are treated who are unable to pay for private medical care. No charge is made for any treatment at this clinic. This clinic was started during the war by the United States Public Health Department but shortly afterwards was taken over by the city of Troy. At the start the clinic was held at the Samaritan Hospital but was transferred to the Health Building on its completion.

The object of the clinic is not only to treat patients sick with these diseases, but also to render them incapable of spreading the infection to others. In this way, in conjunction with the clinics in other cities throughout the state, it is expected that the incidence of these diseases will be materially reduced.

Report of social hygiene clinics, 1928		
New patients admitted—syphilis		40
" gonorrhen		60
Patients discharged well—syphilis		8
" " gonorihen		40
Total number of treatments	2	2,776
Wassermans taken		193
Smears "		76
Spinal treatment for syphilis		54

Hospitals—The city of Troy is fortunite in hiving four modern hospitals—The Troy City Hospital with 268 bcds controlled by the Sisters of Charity, The Samantin with 175 beds controlled by a board of directors, The Leonard with 60 beds controlled by a board of directors, St Joseph Maternity Hospital with 40 beds controlled by Sisters of St Joseph, and The Rensselaer County Hospital within the city limits, which is a part of The County Alins House, has 60 beds where chronic, incurrible, and veneral cases are cared for

The American Red Cross is a very active organization in Rensselver County

Rensseher County is as well if not better equiped in regard to modern hospital accommo dations than any other county of its size and population in the state, but there is room for improvement

CHESTER A HEMSTREET, M D , Chuitinn HARRY W CAREY, M D DAVID H FAUI KNER, M D J J QUINLAN, M D

#### PUBLIC RELATIONS COUNTY SURVEY No 10-ULSTER

Ulster County, situated on the west bank of the Hudson River, is one of the ten original counties of New York State It has a total popu-Intion of about 83,000, divided between 35,643 classified as urban, and 47,409 classified as rural Most of the urban population is concentrated in Kingston City, the County Seat, situated on the Hudson, about 90 miles up the river from New York City, with a population of about 28,000 There are five incorporated villages within the county, three with small populations that are classified as rural, and two, Ellenville and Saugerties, with over 3,000, and over 4,000 population respectively, classified as urban The population of the county is practically the same as it was fifty years ago There has been a decline in the three major industries of fifty years ago, blue stone quarrying, cement making and agriculture A fourth major industry of the county is brick making, which has introduced many foreign and negro laborers who have complicated the Public Health and Public Welfare problems of the county The county includes a large expanse of the Catskill Mountains and is increasingly popufar as a resort. In addition, increased transportation facilities and the expanding metropolis of New York City, are bringing the county increasingly in touch with metropolitan influences.

Supply of Physicians—In December, 1929, there were ninety physicians in Ulster County, divided between forty seven in Kingston and forty three in the county outside of Kingston

In the City of Kingston there has been a remarkable change of physicians in the last three years. In 1926 there were forty seven physicians in Kingston and between that time and December, 1929, sixteen of these died and one left town Seventeen new physicians have started practice in that period. Thus, there has been a change in over one third of the personnel of the physicians in the city in three years' time. The new men are younger, so that whereas the average age of the Kingston doctors was fifty-seven years in 1926 in 1929 it was forty-nine and one-half years.

There are seventy-four members of the Ulster County Medical Society. In other words, about 80% of the doctors belong to the local County Medical Society.

Attendance at the meetings averages 38% for the year, but 87% of these in attendance are from Kingston while only 13% represents out-of-town members.

PublicHealth.—The organization of the Kingston City Health Department consists of three inspectors, a public health nurse and a clerk for the vital statistics. A part-time health officer receives \$1,800 a year. The Health Department operates on a budget of around \$12,650, making a per capita expenditure of about fortyfive cents for the city of Kingston. The city prides itself upon its water supply which is delivered by gravity from the Sawkill watershed in the Catskill Mountains. The Health Department stringently regulates the milk supply, and the city is free from water and milk-born epidemics. About two years ago the Health Department, with the cooperation of the local doctors and others, put on an intensive campaign for toxinantitoxin immunization. A rough estimate would indicate that about two-thirds of the public school children are so immunized. The Health Department has continued this work in more or less regular clinics and a good proportion of the preschool and school children of the city have received the toxin-antitoxin. In the matter of immunization against smallpox the situation is not so good, in that the medical supervisor of the school system judges that only a little over one half of the school children have been vaccinated.

Outside of the city of Kingston, the local Public Health is administered by the system of parttime village and township health officers that is in vogue in New York State. Eight of the twenty townships of the county are without a resident physician. In other words, the health officer does not live in the township. The standard of work done by the health officer varies in different townships and on the whole is not entirely satisfactory. The township is too small a unit for public health administration. Ulster County, semi-rural as it is, would be an excellent county in which to start a county-wide Health Department.

The city of Kingston supports a laboratory in space furnished by the county in one of the county buildings. The services of this laboratory are competent and are extended to the health activities of the county and to the private doctors.

General Hospitalization.—There are two general hospitals in Kingston, the Kingston Hospital (a private corporation) with a bed capacity of 120 beds and 15 bassenets, and the Benedictine Hospital (Our Lady of Victory Hospital) with 90 beds and 10 bassenets. In addition there is a small hospital (Veterans' Memorial Hospital) of 14 beds in Ellenville. This gives the

county a total of 234 acute beds, or one for each 355 inhabitants. The hospitals of Newburgh and Poughkeepsie are also available to the citizens of the southern part of the county. On the other hand, Kingston hospitals draw from the neighboring counties of Greene, Delaware and Sullivan.

In the last five years the Benedictine Hospital has increased its capacity from 50 to 100 beds, and the Kingston Hospital from 65 to 135 beds, but this expansion of bed capacity does not tell the whole story of the marked improvements in plants, equipment, and professional services made in the matter of general hospitalization in Kingston in the last five years.

Each of the Kingston hospitals conducts a registered school of nursing.

Besides the general hospitals, there is an accredited private sanitarium (the Sahler Sanitarium) of 120 beds which handles neurological, mild psychiatric, and cases of general invalidism. While this sanitarium draws from a wider area than the county, it is also available to the people of the county in these conditions.

There are no facilities in Ulster County for the handling of acute psychopathic cases or of cases of infectious diseases.

Tuberculosis.—Ulster County was one of the first counties in the State to start a tuberculosis hospital. A modest beginning was made in 1909, and by 1910 there was a bed capacity of 22 beds. This hospital at present is antiquated and inadequate, and for the last five years or more there has been an agitation to build a new hospital. In spite of the efforts of the County Medical Society and others, progress toward a new hospital has advanced only to the stage of aquiring a new site and connecting the site with water, gas, electricity and sewers. Plans for a new hospital have been drawn, but no contracts have been let. The building of this hospital has been one of the major projects of the County Medical Society, and great efforts have been made to further the project both by the Society as a whole and the individual members. The prospects are now very good that construction on this new hospital will start early in 1930.

While no exact figures are available, the incident rate and mortality from tuberculosis in the country are probably rather high, due to several factors, among which are the racial make-up of the people, and the fact that the county is a mountain or resort one, attracting invalids from the metropolitan region, etc.

One tuberculosis public health nurse has been supported by the Committee on Public Health and Tuberculosis for the last eighteen years or so, and this committee also supports a fresh-air camp for two summer months for undernourished and contact children, in which about sixty children participate.

sixty children participate.

School Health.-The Kingston Board of Education supports a Medical Department for the 4,500 pupils of the public school system, consisting of a school medical supervisor, assisted by a woman physician, together giving the equivalent of full-time medical service, and three school nurses. The school medical supervisor is a neurologist and it is planned to combine the mental with the physical work in the school system. So far, this has been more of a prospect than a fulfillment. The school system conducts one special class for the retarded, and encourages the distribution of milk during the morning sessions, especially to the undernourished pupils. The Kiwanis Club of Kingston pays for this nulk in the cases of undernourished children whose parents cannot afford to do so. Negotiations are well under way to start a free dental clinic in the public school system in conjunction with the Medical Department.

Clinics.—The only organized work in maternity, infant, and pre-school child welfare is carried on by the Junior League of Kingston which maintains a headquarters and fairly regularly sponsors clinics in these departments of public welfare. This work has the approval of the County Medical Society, but only the half-hearted

support of the individual doctors.

Besides the Junior League and the immunization clinics conducted by the Kingston Health Department, there are no other local clinics. However, the State conducts regularly mental and child guidance clinics, and occasionally chest and orthopaedic clinics. There are no suitable accommodations or rooms in Kingston for the holding of these clinics. There are no dispensaries, no venereal clinics (although a recent survey of the State Board of Health indicates the need for the same) in Ulster County.

Health Agencies.—There are altogether sixteen public health nurses and welfare agents in the county, including a Kingston city public health nurse, a county tuberculosis nurse, three Kingston school nurses, a Metropolitan Life Insurance nurse, a school nurse and a township nurse in Saugerties, a nurse in the townships of Lloyd and Mariboro, a school nurse in Ellenville, a county agent for dependent children, a Catholic Charities agent, a Hebrew Charities agent, and one industrial nurse.

Among the agencies operating in behalf of public health and public welfare in the county, besides the Junior League and the Catholic Charities, which have already been mentioned, and which are rendering excellent services, there is the semi-official Board of Child Welfare associated with the State Charities Aid for the care of dependent children, and a county Agent for

the same is supported.

There is a County Committee on Public Health and Tuberculosis which is small and geographi-

cally unrepresentative, and whose work is carried on by a few enthusiastic and dependable people. The medical profession is well represented on this committee which works along harmoniously with the organized Medical Society.

There is a County Chapter of the American Red Cross whose work is mainly national, but which does some work within the county. There is an active county organization of the American Legion which carries on welfare work among ex-service men. The Salvation Army carries on actively among indigents.

Civery annong margenes.

The Federation of Women's Clubs is interested, through its Committee on Public Health and in other ways, in the public health and wel-

fare activities of the county.

There are nine active Parent-Teacher Associations in Kingston which are eager to promote welfare activities, especially among the children. In the summer of 1929 they sponsored a summer round-up of the pre-school children about to enter school in the fall. In addition, several of the communities outside of the city have Parent-Teacher organizations.

The Ulster County Farm and Home Bureaus and various granges are well organized and active associations which are doing much to disseminate facts of Public Health, especially rural health in the county. They have pronoted much toxin-antitoxin immunization work in the rural communities and they have made a beginning toward the establishment of infant and pre-school child clinics.

Indigents.—The problem of the indigents is one that is of medical interest in that the doctors are continually called upon to solve social problems, to make social placements, to render medical service to institutions, and to individual indigents.

The city of Kingston runs a well conducted City Home, averaging about 60 inmates on a budget which, including outside relief, averages around \$50,000 a year. The city pays two physicians \$600.00 a year to act as city physician to treat the indigents, and one of these physicians acts as attending physician to the City Home. Indigents requiring hospital care are referred by the Commissioner of Public Welfare to the general hospitals which are re-imbursed so much a day for their care.

For the county outside of Kingston there is a Poor Farm at New Paltz. It is equipped to function as a hospital or infirmary, but the only medical attendance is that of a local doctor who comes from a distance and receives only about \$600 a year remuneration.

There is an excellent home in Kingston for dependent children with a capacity of about fortyfive, with a voluntary attending physician, and a large consulting staff of local doctors. This home, together with the placement facilities afforded by the Board of Child Welfare, through its agent takes good care of the dependent child. There is also a large Catholic orphanage in the county (Sacred Heart Orphanage) which not only draws from the county but also from a wider radius.

At the present time there is being constructed a new and complete Home for the Aged, with a capacity of about forty beds to replace the present smaller and less adequate one. There is a voluntary staff of local physicians for this institution.

Criminology.—The relationship of medical activities and the administration of justice in the county could be improved. Due to the low remuneration (about \$400.00 a year) it has been difficult to secure a physician who will act in the rather arduous capacity of jail physician. There is no systematic effort on the part of the local authorities to avail themselves to any great extent of the medical and psychiatric aids that might

be of service to them in their administration of justice.

The probation officer is a welfare agent, but the one individual who attempts to serve in this capacity to the municipal, county and juvenile courts of Ulster County at a salary of about \$1,000 a year, is unable, however zealous, to perform this work completely satisfactorily on a parttime basis.

There has been a standing committee on Public Health and Public Relations of the Ulster County Medical Society since December, 1926. This committee is trying to fulfill its functions as laid down by the State Committee and has succeeded in some particulars, at least to the extent of making this inadequate survey.

RAYMOND S. CRISPELL, M.D.,
Chairman of the Committee on Public
Health and Public Relations of the Ulster
County Medical Society.

#### ORLEANS COUNTY

The annual meeting of the Medical Society of the County of Orleans was held at the Alert Club Rooms, Medina, N. Y., November 21, 1929.

The meeting was called to order by the President, Dr. F. W. Scott. The following officers were elected for the year 1930:

President, Donald, F. Macdonell, M.D., Medina. Vice-President, Ralph E. Brodie, M.D., Albion. Sec'y-Treas., Robert P. Munson, M.D., Medina. Censors, J. Fred Eckerson, M.D., Medina, D. F.

Macdonell, M.D., Medina, and L. G. Ogden,

M. D., Holley.

Delegate to State Society, C. E. Padelford, M.D., Holley.

14----

Alternate to State Society, D. F. Macdonell, M.D., Medina.

The president and secretary were named to constitute all standing committees.

The committee named to survey the by-laws

at the last meeting reported several changes which seemed to them to be advisable. Motion was carried that these by-laws be amended in accordance with the committee's recommendations. This will be voted on at the next meeting.

The following candidates having been favorably reported upon by the Censors, were unanimously elected to membership:

Adfur E. Maines, M.D., Medina, and Julius J.

Layer, M.D., Lyndonville.

Following the business meeting Dr. A. H. Aaron of Buffalo gave an excellent paper on "The Therapeutics of Gastro-Intestinal Disease." Discussion was led by Dr. W. D. Johnson of Batavia, and Dr. Francis Leopold of Buffalo.

A turkey dinner brought to a close a most en-

joyable and enthusiastic meeting.

Members present, 15; candidates, 2; guests, 5.
ROBERT P. MUNSON, Secretary.

#### KINGS COUNTY

The stated meeting of the Medical Society of the County of Kings was held November 19, 1929, in McNaughton Auditorium. The program was given over to the health examination idea in cooperation with the Five County Societies of Greater New York Committee on Health Examinations.

A motion picture film was presented showing the technique of a complete physical examination, featuring an arrogant young man who is induced to be examined on a dare, and who is found to have several things wrong with him of which he was unaware. His resolve to return for a periodic examination on each birthday is the keynote of the whole picture. Following the showing of the film, there were short, concise addresses, emphasizing certain particular features of the special examinations which a general practitioner is required to make. The guest speakers of the evening were Louis Cassamajor, M. D., and Henry S. Dunning, M. D., from the Neurological and Oral Surgical Services, respectively, of Columbia University Medical Center; and Wesley M. Hunt, M. D., and Thomas H. Johnson, M. D., from the Otological and Ophthalmological Services, respectively, of New York University and Bellevue Medical School. A discussion of the practical application of the physical examination to the specialities was opened by Dr. Alec M. Thomson.

#### SENECA COUNTY

The regular meeting of the Seneca County Medical Society was held October 10, 1929, at Willard State Hospital. Officers were elected as follows:

President, A. J. Frantz, M.D.; Vice-President, L. W. Bellows, M.D.; Secretary and Treasurer, R. F. Gibbs, M.D.; Delegate to State Society, F. W. Lester, M.D.; Alternate to State Society, W. M. Follette, M.D.; Delegate to 7th District Branch, A. Letellier, M.D.; Alternate to 7th District Branch, R. F. Gibbs, M.D.; Censors: Drs. Lester, Bacon and Bellows.

The Committee on Public Relations through the chairman, Dr. C. A. J. Brown, reported that the services of the Committee offered to the Parent-Teachers Association of Seneca Falls, the State Charities Aid Society and the Tuberculosis Clinics had been acknowledged and accepted. The Committee has made an earnest endeavor to impress all lay organizations that the physicians of the County were ready to assist at all times.

An amendment to the By-Laws. Chapter 9, was offered by the revision committee, Drs. Brandt, Gibbs, and Lester, relative to increasing the number of meetings from two to four a year. It was resolved that action be deferred until the next regular meeting, and that copies

of the proposed amendment be sent to all members in the interim.

The meeting then adjourned for dinner on the invitation of Dr. R. M. Elliott, Superintendent of the Willard State Hospital.

On reconvening at 2 P.M. the Scientific session was as follows:

1. "Some of the developments in the Modern Practice of Urology" by Dr. Thomas F. Laurie of Syracuse. Dgsuria, Hematuria, pyuria and renal Calculus were especially stressed. Discussion by Drs. Elliott, Gordon, Letellier and Lester.

2. "Rupture of the Uterus at Full Term." by Dr. Frederick W. Lester of Seneca Falls. Causes, symptoms and treatment were discussed. A case of complete rupture of a full term uterus was fully described in which there was complete extrusion of the contents into the abdominal cavity. Operation was performed with complete recovery. Discussion by Drs. Elliott. Frantz and Letellier.

The thanks of the Society were voted to Drs. Laurie and Lester for the scientific program and to Dr. Elliott for his hospitality at the Willard State Hospital. The meeting was adjourned to meet at Seneca Falls the second Thursday in May, 1930.

R. F. Guns, Secretary.

#### SUFFOLK COUNTY

From the Monthly News Letter of the Suffolk County Medical Society for November, 1929

The Annual Meeting of the Suffolk County Medical Society was held in the Henry Perkins Hotel, Riverhead, on October 31, beginning at 11:30 in the morning Forty-two doctors were in attendance, twenty health nurses, six members of the Suffolk County Tuberculosis and Public Health Association, and other visitors, bringing the total attendance up to eighty-two. The President, Dr. E. R. Hildreth, presided, and the Secretary, E. P. Kolb recorded.

Reports were given by the various committees. That of the Public Health Committee by the Chairman, Dr. Frank Overton, was published in the October issue of the News Letter.

Dr. W. H. Ross, Chairman of the Legislative Committee, reported that there was little medical legislation introduced last year, and that therefore the Committee had little to do.

The question of physicians' insignia supplied by the American Medical Association for automobiles was taken up, and on motion the Comitia Minora was authorized to investigate the matter with power to act.

The Secretary reported the deaths of Dr. Harold Hewlett, of Babylon, Noah S. Wadans, of Westhampton Beach, and Lewis A. Twining, of Center Moriches. On motion, the President appointed Drs. A. H. Terry and M. B. Lewis a committee to prepare suitable memorials for the deceased members.

At the request of the President, Dr. A. T. Davis, County Health Officer made a report of the activities of the Health Department. Dr. Davis introduced the County Veterinarian, the Sanitary Engineer, Mr. Cook, and Miss Bradly, Supervising Nurse, who made brief addresses.

New members proposed were Dr. Hans Jergenson of Greenport; Dr. Reginald Stin, of Kings Park; and Dr. Myron L. Hafer, of Pstchogue. These were referred to the Censors, and on their favorable report, were elected bership.

The President appointed Drs. E. M. Overton, Frank Overton, and A. G. Terrell a committee on nominations for the year 1930. This committee reported as follows:

President, Dr. A. E. Payne, of Riverhead. Vice-President, Dr. William J. Tiffany, of

Kings Park.

Secretary, Dr. E. P. Kolb, of Holtsville, Treasurer, Dr. Grover A. Silliman, of Sayville

Censors, Drs. George H. Schenck, Southampton, Frank S. Child, Port Jefferson, and James S. Ames, Babylon.

Delegates to the State Society: Drs. A. E. Payne and William J. Tiffany.

On motion these officers were unanimously elected and the delegates were authorized to appoint their alternates with the approval of the Comitia Minora.

The report of the Treasurer, Dr. G. A. Silliman showed the monthly News Letter costs the Society \$746.63 annually, but the Suffolk County Tuberculosis and Public Health As-

sociation paid the Society \$581.92 for copies purchased and sent to laymen interested in health.

The local Society dues of five dollars provides for all the expenses of the Society, and also a surplus which now amounts to over two thousand dollars.

The President appointed Drs. C. C. Miles and J. I. Halsey as auditing committee, which reported later that they found the accounts correct.

The members and guests then dined together, after which Doctor Hildreth gave the Annual President's address.

The address of the day was by Dr. Allan W. Freeman, Professor of Public Health at Johns-Hopkins University, who had been engaged by the Comitia Minora to make a survey of the County. (See this JOURNAL, December 15, 1929, p. 1503.)

The meeting adjourned at four o'clock after one of the most successful and enthusiastic meetings ever held by the Society.

E. P. Kolb, Secretary.

#### JEFFERSON COUNTY

The annual meeting of the Medical Society of Jefferson County was held at the Black River Valley Club November 14.

The speaker of the evening was Dr. Anthony Bassler, New York City, who addressed the Society on "Toxemia of the Gastro-Intestinal Tract," his subject being demonstrated by lantern slides.

The following officers were elected for the ensuing year:

President, F. G. Metzger, M.D. Vice-President, J. E. McAskill, M.D.

Secretary, Walter Atkinson, M.D. Treasurer, Walter F. Smith, M.D.

Censors: D. G. Cregor, M.D., Chairman; J. A. Barnette, M.D., G. F. Bock, M.D., F. R. Calkins, M.D. and P. E. Thornhill, M.D.

Dr. Eggleton Clifford Soults was elected to membership.

It was a very interesting meeting with fortyeight members present.

WALTER S. ATKINSON, Secretary.

#### ART EXHIBITIONS

The fourth annual exhibition of the New York Physicians Art Club, will be held at the Academy of Medicine, 103rd Street and 5th Avenue, New York City, from February 15th, until March 15th, 1930.

Contributions of original work will be gladly received from all physicians who are interested in painting, sculpture, etching, or any other works in the liberal arts or craft. Those wishing to enter exhibition of their

work are requested to communicate at once with, Dr. Herman Fischer, 35 East 84th Street, New York City. Physicians up-state are invited to show their work.

The exhibit of last year was described in this Journal of February 15, 1929, page 228. Over fifty physicians contributed more than three hundred works of art which would have done credit to any museum or art gallery in the land.

# THE DAILY PRESS

#### COUNTY SURVEYS

New Year resolutions look backward as well as forward, like the two faces of Janus, the ancient god of beginnings, after whom the first month of our year was named. Some leaders of county medical societies are in the plight of the business man represented by J N Ding in the New York Herald Tribune or January second. This Journal for January first contained a list of the civic achievements of county medical societies during the past year. That list consisted of those activities which were of such outstanding importance that they were worthy of perpetuation in the public records of the Medical Society of the State of New York, because of their originality or their practical value as examples for other counties to follow. No insinuation was intended that those county societies not on the list were failing to measure up to the standards set by the leaders of the Medical Society of the State of New York. Practically all the county societies are following the example of Ulster and Rensselaer, whose surveys appear on page 102 and are quietly taking stock of the medical needs of their counties and devising ways of supplying the needed service.

County Society leaders may be perplexed as they think over what they have done, for most people are afflicted with an inferiority complex, and look on defects rather than perfections. The six-page index of Medical Society activities published in the Journal of December fifteenth, is a revelation of the ever increasing

activities of Medical Societies the impetus of last year's progress will doubtless extend through all the year 1930.

I. N. Ding in the New York Herald Tribune of January

#### PROLONGING LIFE

An editorial in the New York Times of December 14, refers to an offer of Mr. Du Pont to assist life insurance companies in a research into the prolongation of human life, and says:

"A united effort of this nature and magnitude would be the greatest challenge that man ever made to death. It would, of course, not aim at a mere prolongation of life. According to the story which Virgil tells in the Aeneid, she who was promised the fulfillment of her utmost wish if she would accept the love of Apollo took a handful of sand and, holding it torth, said "Grant me as many birthdays as there are sand-grains in my hand' But she forgot to ask for enduring youth. She lived on for 700 years, and when Acneas accompanied her back from the journey to the Elysian Fields she had still to see '300 Springs'

and 300 harvests,' but with a body that 'shrifer up as the years increase.' The lengthening of life should be attended by maintenance of the faculties that give fullness to life. To treadded years without growing incapacity is the major problem.

"The increasing stress laid upon and cation has in its thought the prolemant rest in life—postpouling the end are the insurance of lengthened placed lengthened conomic life must prove the life insurance job placed lengthened it is the life insurance job proven what Apollo gave to an ancier and are end life, it will be the oblice that the fullness of life does a series of the categories and the fullness of life does a series of the categories and the fullness of life does a series of the categories and the fullness of life does a series of the categories and the fullness of life does a series of the categories and the fullness of life does a series of the categories and the fullness of life does a series of the categories and the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories and the categories are the categories are the categories and the categories are

Numerous are the popular formulas for attaining old age. The New York Herald Tribune of January second, quotes W. P. Draper, a Civil War survivor now ninety years old, as saying:

"If water will rust pipes, it will rust those inside the body. Avoid drinking it, if you would live long. Coffee, tea, ale, beer and a

discreet number of highballs are the drinks worthy for any man."

The article states that Mr. Draper acquired his aversion to water when he was ship-wrecked as a sailor, and also when he was lowered over the side of Admiral Farragut's Flagship to caulk shotholes during the battle of New Orleans.

#### BETTER LIFE INVESTIGATION

The New York *Herald Tribune* of December 20 contains the following announcement regarding a new research institute by President Hoover:

"The White House announcement outlined the project as follows:

"At the request of a number of interested agencies the President has appointed a Research Committee on Social Trends to direct an extensive survey into the significant social changes in our national life over recent years, paralleling in character the investigation of economic changes made over a year ago. Such subjects will be studied as the improvement of national health and vitality, its bearing upon increased number of persons of 'old age' and other results; the changes in the maladjusted, such as insane, feeble-minded, etc.; the effect of urban life upon mental and physical health; the institutional development to meet these changes; the problems

arising from increased leisure; changes in recreation and the provision for it; the changes in occupations; occupations likely to continue to diminish in importance; those likely to increase; the changes in family life, in housing, in education; the effect of inventions upon the life of the people, and many others which may indicate trends which are of importance.

"The funds for the research have been provided by the Rockefeller Foundation, and invaluable preliminary aid in defining the nature of the survey has been rendered by the Social Science Research Council.

"The Chairman of the Committee is Wesley C. Mitchell, professor of economics, Columbia University, director National Bureau Economic Research, and past president of American Economic Association and of American Statistical Association."

#### LAMARCK AND EVOLUTION

The New York Times of December 18 has an editorial on Lamarck, which says:

"The centenary of Lamarck's death has arrived, but proof of his theory concerning the transmission of 'acquired characteristics' has not come to share in the celebration of this day. Professor McDougall is still going forward with his experiments, with rats repeating the training process and "selecting adverseley," thus putting Lamarckian transmission to its severest test. In Lamarck's own prefatory statement of his doctrine a new want gives birth to a new organ or function, or, as a later philosopher has maintained: "The soul is sure to mold for itself such a body as its wants and vocation require." In addition, the change wrought through 'appetence,' the reaching out in one direction or another, is transmissible to the offspring."

The editorial closes with the following quotation from Lamarck's writings which sums up

his theory:

"All that has been acquired, laid down or changed in the organization of individuals in the course of their life, is conserved by generation and transmitted to the new individuals which proceed from those who have undergone these changes."

Lamarck believed in the transmissability of acquired characteristics. A trained scholar, for example, would transmit a capacity for scholarship to his children. But thirty years after Lamarck's death, Charles Darwin first stated the modern view that evolution consisted essentially of the transmission of capacities only; and no amount of training could affect their transmission to offspring. pregnant women, without musical ability, practice on the piano daily in hopes that their children will be musical, and many others decorate their boudoirs lavishly in order to make their babies artistic, and still others seclude themselves at home in order to avoid sights which might "mark" their children.

# BOOKS RECEIVED

£133

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

- DISEASES OF THE BLOOD. By PAUL W. CLOUGH, M.D. 16mo of 310 pages. New York and London, Harper & Brothiers, 1929. Flexible leather, \$2.50 (Harper's Medical Monographs).
- THE MOST-NEARLY PERFECT FOOD. The story of Milk. By SAMUEL J. CRUMBINE, M.D., and JAMES A. TOREY, Dr. P.H. 12mo of 292 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1929. Cloth, \$2.50.
- OUTLINE OF BACTERIOLOGY. BY HENRY A. BARTELS, B.S., D.D.S. Octavo of 128 pages, illustrated. New York, William Albert Broder, 1929. Cloth, \$2.00
- FUNDAMENTALS OF PATHOLOGY. By JOSEPH SCHROFF, B.S., M.D., D.D.S. Octavo of 109 pages, illustrated. New York, William Albert Broder, 1929. Cloth, \$2.50.
- MENICAL LEADERS FROM HIPPOCRATES TO OSLER, By SAMUEL W. LAMBERT, M.D., and GEORGE M. GOODWIN, M.D. Octavo of 331 pages, illustrated. Indianapolis, The Bobbs-Merrill Company, 1929. Cloth, \$5.00.
- THE MEDICAL RECORD VISITING LIST OR PHYSICIANS' DIARY FOR 1930. Revised. 16mo New York, William Wood & Company, 1929. Flexible leather, \$2.00.
- Text-Book of Embryology. By Frederick Randolphi Bailey, A.M., M.D., and Adam Marion Muler, A.M., 5th revised Edition. Octavo of 687 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$7.00.
- THE PATHOLOGY OF THE EYE. By JONAS S. FRIEDEN-WALD, A.M., M.D., F.A.C.S. Octavo of 346 pages, illustrated. New York, The Macmillan Company, 1929. Cloth, \$450.
- THE FEMALE SEX HORMONE. By ROBERT T. FRANK, A.M., M.D., F.A.C.S. Part I. Biology, Pharmacology and Chemistry. Part II. Clinical Investigations Based on the Female Sex Hormone Blood Test. Octavo of 321 pages, illustrated. Springfield, Ill., Charles C. Thomas, 1929. Cloth, \$3.50.
- METHODS AND PROBLEMS OF MEDICAL EDUCATION. (Four-teenth Series.) Quarto of 207 pages, illustrated. New York, The Rockefeller Foundation, 1929.
- The Physician Throughout the Ages. A Record of the Poctor from the Earhest Historical Period. By Artius Relwyn-Brown, B.Sc., M.A., Ph.D.,L.D. Two folio volumes. v. 1. 848 pages, illustrated, v. 2, 884 pages, illustrated. New York, Capehart-Brown Company, Inc., 1928 Cloth, \$2500 per set.
- POSTURE AND HYGIENE OF THE FEET. By Philip Lewin, M.D. 16mo of 47 pages, illustrated. New York and London, Funk & Wagnalls Company, 1929. Flexible leather, \$30. (National Health Series.)
- AIDS TO DERMATOLOGY AND VENEREAL DISEASE. By ROBERT M. B. MACKENNA, M.A., M.B. 16mo of 236 pages. New York, William Wood and Company, 1929. Cloth, \$1.50.

- Synopsis of Midwifery and Gynecology. By Aleck W. Bourne, B.A., M.B., B. Ch. (Camb.). Fourth Edition. 12mo of 434 pages, illustrated. New York, William Wood and Company, 1929. Cloth, \$4.50.
- THE NERVOUS CHILD. BY HECTOR CHARLES CAMERON, M.A., M.D. Fourth Edition, 12mo of 249 pages. London and New York, Oxford University Press, 1929.
- COMMON INFECTIONS OF THE FEMALE URETHRA AND CERVIX. BY FRANK KIDD, M.A., M. Chi, and A. MALCOLM SIMISON, B.A., M.B., D.P.H., Octavo of 197 pages, illustrated. London and New York, Oxford University Press, 1929. (Oxford Medical Publications.)
- GRENZ RAY THERAPY. By GUSTAV BUCKY, M.D. Translated by WALTER JAMES HIGHMAN, M.D. Octavo of 170 pages, illustrated. New York, The Macmillan Company, 1929. Cloth, \$3 50.
- THE NEWER KNOWLEDGE OF NUTRITION: The Use of Foods for the Preservation of Vitality and Health. By E. V. McCollum, Ph.D., ScD., and Nima Simmonds, Sc.D. Fourth Edition. Octavo of 594 pages, illustrated. New York, The Macmillan Company, 1929. Cloth, \$5.00.
- A PRACTICAL TREATISE ON DISORDERS OF THE SEXUAL FUNCTION IN THE MALE AND FEMALE. By MAX HOUNER, M.D. Third Edition. Octavo of 342 pages. Philadelphia, F. A. Davis Company, 1929. Cloth, \$3.00.
- PRACTICAL MASSAGE AND CORRECTIVE EXERCISES WITH APPLIED ANATOMY. By HARTVIG NISSEN, Fifth Edition, revised and enlarged by Harry Nissen. Octavo of 271 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, \$2.50.
- THE BLOOD PICTURE AND ITS CLINICAL SIGNIFICANCE (INCLUDING TROPICAL DISEASES): A Guidebook on the Microscopy of Blood. By Professor Dr. Victor Schilling. Translated and edited by R. B. H. Gradwohl, M.D. Seventh and Eighth Revised Edition. Octavo of 408 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$10.00.
- MODERN METHODS OF TREATMENT. By LOGAN CLENDEN-1NG, M.D. Third Edition. Octavo of 815 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, \$10.00.
- An Introduction to the Study of the Nervous System. By E. E. Hewer, D.Sc., and G. M. Sandes, M.B., B.S. (Lond.). Octavo of 104 pages, illustrated. St. Louis, The C. V. Mosby Company, 1929. Cloth, 65.50.
- A SYSTEM OF BACTERIOLOGY IN RELATION TO MEDICINE, [By Various Authors. Prepared under the direction of the Medical Research Council.] Volume IV. Octavo of 482 pages. London, His Majesty's Stationery Office, 1929. Cloth, £8.8-0 a set; £1-1-0 cach.
- Dr. Colwell's Dally Log for Physicians: A Brief, Simple, Accurate Financial Record for the Physician's Desk. Octave, Champaign, Illinois, Colwell Publishing Company, 1929.

# BOOK REVIEWS

DIAGNOSTIC METHODS AND INTERPRETATIONS IN INTERNAL MEDICINE. By SAMUEL A. LOEWENBERG, M.D. Octavo of 1032 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, \$10.00.

This book contains information which can only be acquired by a wide experience gained from general practice as well as specialization. The various chapters, all of which contain a wealth of material, emphasize the great importance of skill in physical diagnosis and yet do not minimize the practical value of the various laboratory tests. The latter are carefully interpreted in a way in which the general practitioner can grasp their signifi-cance and thus properly evaluate them. The simplest technical methods are described.

Special chapters are devoted to Neurology and Roent-genology written by Drs. M. K. Meyers and Leon Solis-Cohen respectively, Each of these are text books in themselves. The last chapter makes this volume vven more unique. It deals with physical examination as applied to Industry, Life Insurance, Health Preservation and Detection of Malingering. These are problems of which other text books of this type neglect to treat, yet are of inestimable value to the practitioner as well as the

S. H. POLAYES, M.D...

RELLECTIONS AND OPERATIONS. By SIR JOHN O'CONNOR, K.B.E., M.A., M.D. Octavo of 361 pages. London, Bailliere, Tindall & Cox, 1929. Cloth, 21/.

This book is delightfully interesting. Sir John must have been a rare man and one whom it would have been a pleasure to know. His life was filled with interest from the time of his boyhood when as a redheaded Irish urchin he frolicked by the waterside of the beautiful Shannon till the last great "innings" (as he himself would express it) was closed, and he left the world to those who had known and loved him, infinitely the poorer.

The reading of the collection of his writings, edited by Beatrice and May O'Connor with a foreword by Her-bert J. Paterson, has proved of such great interest that the reviewer can well recommend it, not only to those interested in the history and progress of Surgery but to those who are interested in literature and humanity.

The most extensive review could give but a slight idea of the pleasure and profit which may be had from reading this book. It is so real that you will want to treasure it.

RUSSELL S. FOWLER.

WHY WE ARE MEN AND WOMEN OR FACTORS DETERMINING SEX. By A. L. BUNEDICT, A.M., M.D. 12mo of 270 pages. New York, Allen Ross & Company, 1929. Cloth, \$2.50.

In the first chapter of this somewhat unusual book, the author speculates as to what would be the result if human beings were able to regulate "in advance" the sex of their offspring. Potential parents would be influenced by the desire to maintain the family-name and thus would prefer a boy; yet authorities in charge of institu-tions which have children for adoption, report that 75% of the applications are requests to adopt girls.

The author sees a practical advantage to sex control as a factor in climinating such diseases as hemophilia, color blindness, etc., in which the abnormalities may be shown to be definitely linked with sex in the parent

Further, the ability to control sex would stimulate

interest in the study of heredity along practical human lines, Dr. Benedict believes.

The author devotes several chapters to a consideration of the physiology of reproduction and discusses a few of the theories that have been adduced to explain the why and wherefore of sex determination.

The apparent date of fecundation in relation to the menstrual cycle has been thought by some observers to influence the sex of the resulting offspring, but the evidence is not conclusive.

It has also been claimed that "fresh" semen is more likely to produce a male, and "stale" semen a girl, but here again the conclusions are purely speculative.

The riddle of sex remains unsolved, and the author frankly admits it.

FRANK E. MALLON.

THE CYTOARCHITECTONICS OF THE HUMAN CEREBRAL CORTEX. By CONSTANTIN VON ECONOMO. Translated by Dr. S. Parker. Octavo of 186 pages, illustrated. New York, Oxford University Press, 1929. Cloth, \$6.25. (Oxford Medical Publications).

This volume on the cytoarchitectonics of the human combral parter is your much passed and those interested.

cerebral cortex is very much needed and those interested in the subject will do very well to read this volume. It is a very great aid to the larger volume on this subject by Professor von Economo and others. The material is particularly well arranged. The illustrations which are so necessary in this subject are very numerous and well arranged. The descriptive text is in great detail considering the size of the volume which includes some of Professor von Economo's original work.

GERALD C. PARKER.

DISEASES OF THE GUMS AND ORAL MUCOUS MEMBRANE. By Sir Kenneth Goadby, K.B.E. Third Edition. Octavo of 412 pages, illustrated. New York and London, Oxford University Press, 1928. Cloth, \$13.00. (Oxford Medical Publications.)

A most worthy book made more so by its revision in this Third Edition.

In its general make-up and composition, it is precise and to the point. The subject at hand has been covered not only better than previously, but better and more exactly than in any book that has recently come to the reviewer's attention.

Special mention must be made of the rewriting of the entire chapter on "Diseases Originating from Mouth Affections" which, though in need of great amplifica-tion, gives much food for thought and study.

It is a medical book, written by a keen observer of oral conditions and its concomitants which would make a valuable addition to any man's library.

LEONARD KOHN.

THE LIFE OF HERMANN M. BIGGS, M.D., D.Sc., LL.D. Physician and Statesman of the Public Health. By C. E. A. Winslow, Dr.P.H. Octavo of 432 pages, illustrated. Philadelphia, Lea and Febiger, 1929. Cloth, \$5,00.

This is the story of an unusual man. It is human in every detail, not only as to the life incidents of the man, but also the work which he broadened and established on a firm basis. Dr. Winslow has very ably and subtly reviewed the history of public health by bringing out Dr. Biggs' contributions and reactions to his contemporaries.

It is intensely interesting and worthwhile from an educational standpoint.

J. J. W.

A MANUAL OF HELMINTHOLOGY, MEDICAL AND VETERI-NARY. By H. A. BAYLIS, M.A., D Sc. Octavo of 303 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$10.00.

This volume of almost 300 pages is illustrated by numerous drawings and has a special index of the

parasites and the hosts in which found.

The important relation of this branch of zoology to disease need not be here emphasized; it is well appreciated by the world at large.

The author has succeeded in presenting the subject

in an interesting style.

H. M. FEINBLATT.

· GYNECOLOGY WITH OBSTETRICS. A Text-Book for Students and practitioners. By John S. Fairbairn, M.A., B.M., B.Ch. Second Edition. Octavo of 810 pages, illustrated. New York and London, Oxford University Press, 1928. Cloth, \$8.00. (Oxford Medical Publications.)

Dr. Fairbairn has offered the profession in this book a complete survey of the title subject. The prologue is one of the finest resumes of medical history that twenty-five pages of printed matter can offer.

Besides treating the subject in the latest and most authoritative manner, he also includes chapters on public health service and vital statistics, social and ethical

aspects.

This book should be read not only by students but

by the profession in general.

G. W. P.

A MANUAL OF ELEMENTARY ZOOLOGY. By L. A. BORRA-DAILE, ScD. Sixth Edition 12mo of 683 pages, illustrated. New York and London, Oxford University Press, 1928. Cloth \$5.00. (Oxford Medical Publications.)

This book does not require much of an introduction That it is already in its sixth edition speaks for itself. It discusses in academic fashion the various representatives of the animal kingdom, and brings to mind in a refreshing ma

bae, parameciae, lower animals.

in assisting the in animals.

EMANUEL KRIMSKY.

GYNECOLOGY: A Text-Book of the Diseases of Women. By LYNN LYLE FULKERSON, A.B., M.D. Octavo of 842 pages illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$9.00.
Dr. Fulkerson offers the medical profession a textbook which to the reviewer has its larger appeal not

so much from the section devoted to gynecology but rather to the section devoted to the urinary tract, anus and rectum. Despite the close anatomical relation of these various parts, many gynecologists are prone to slur over them. Backache, gonorrhoea, syphillis, tuber-culosis, protein therapy and radium are each treated in separate chapters. Caudal anesthesia is also care-fully reviewed. The section of the book devoted to operative technique is indeed of value as a careful perusal of the illustrations alone will aid and guide anyone who is doing surgery.

THE ELEMENTS OF CRIME (PSYCHO-SOCIAL INTERPRETA-TION). By Boris Brasol, M. A. Octavo of 431 pages, illustrated. New York, Oxford University Press, 1927.

Cloth, \$5.00.

For one interested in this phase of sociology, this is an extremely valuable book. And though the author was a former prosecuting attorney of St. Petersburg, he adopts the medico-sociological interpretation. He stresses the fact that we cannot cure crime until we get at the causes.

He divides his book into two parts,-the first dis-

cussing crime in its relation to social phenomena; the second, the psycho-physical nature of crime,

His chapter on mental disease and crime, though very brief, would be very helpful to the average physician not especially trained in Psychiatry. This book is one we highly recommend, JOHN F. W. MEAGHER.

A STUDY OF EDUCATIONAL ACHIEVEMENT OF PROBLEM CHILDREN. By RICHARD H. PAYNTER, Ph.D., and PHYLLIS BLANCHARD, Ph.D. Octavo of 72 pages. New York, The Commonwealth Fund, Division of Publi-

cations, 1929. Problem children are commonly encountered by physicians, who generally have but a faint knowledge of their subject because of its neglect by the average medical school. A good deal of work in this field has been done by clinics established by endowment funds by charitable organizations. The volume under discussion is one of several works recently published dealing with the findings of cases coming to these clinics. The book contains the data taken from the case records of the demonstration child guidance clinics in Los Angeles and Philadelphia, conducted by the National Committee for Mental Hygiene. As a result of the study, the authors tentatively concluded that problem children show no general tendency to low educational achievement. The book is replete with valuable data, and will prove of interest both to the physician and the educator.

IRVING J. SANDS, M.D.

ORTHOPEDIC SURGERY. By Sir ROBERT JONES, Bart., K.B.E., C.B., and ROBERT W. LOVETT, M.D., F.A.C.S. Second Edition, revised. Octavo of 807 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$11,00.

It is difficult to appraise a volume as "the best" or rate it in some grade below this without incurring criticism, but surely there is no more complete or wellassembled volume on the subject in the English language than Jones and Lovett's Second Edition of "Orthopedic

Surgery.' Since the publishing of the First Edition five years ago, Dr. Robert W. Lovett has passed on, but the American viewpoint has been splendidly presented by Dr. Nathaniel Allison, Professor of Orthopedic Surgery in Harvard Medical School, who is acting in the capacity of American Editor-in-Chief. Not to forget the able assistance of Dr. Frank Ober, who gave value

able help to Dr. Lovett in preparing the First Edition. One hundred pages of subject matter have been added, largely due to the addition of sections on Diseases of the Tendons, Muscles, and Fascia, Nerve Lesions, Pyo-genic Infections, Vascular Lesions of the Extremities, Amputations, and Artificial Limbs.

The book contains an infinite amount of knowledge for which every physician has a constant need. The General Surgeon will find it invaluable, and the Orthopedic Surgeon may well consider it a fitting tribute to his specialty.

DISEASES OF THE LARYNX, INCLUDING THOSE OF THE TRACHEA, LARGE BRONCHI AND ESOPHAGUS. By HAR-OLD BARWELL, M.B. (Lond.), F.R.C.S. (Eng.), Third Edition. Octavo of 278 pages, illustrated. New York and London, Oxford University Press, 1928. Cloth, \$3.65. (Oxford Medical Publications.)

This book is intended as a practical treatise especially for the physician and surgeon and for the student. The author has done so well in so few pages that this work should attract the attention of the laryngologist.

The volume is well illustrated and the arrangement is admirable. The chapter on conditions of the larynx in general systemic disease is a feature.

The author and his publishers are to be congratulated

M. C. MYFRSON,

# OUR NEIGHBORS

#### HOUSE OF DELEGATES OF COLORADO

The Annual Meeting of the Colorado State Medical Society was held in Greely, September 3-5, 1929, and reports of the proceedings fill thirty-two pages of the December issue of Colorado Medicine.

It is interesting to note that following the example set by New York, a very full index

of the proceedings is printed.

The Publication Committee reported the following cost of the Journal, Colorado Medicine, which is also the organ of the Wyoming State Medical Society.

"Appropriation (\$2 per capita), Colorado. Wyoming subscriptions	343.84
EXPENDITURES	,
Salary of Editor \$ 300.0 Salary of Editor's Secretary 600.0 Printing and mailing of "Colorado Medicine" 4,637.2 Commissions on advertising 784.6 Incidental 83.2	0 6 1
Deficit	35.26
\$6,405.10	5 \$6,405.16

During the year Colorado Medicine received sixty books for review and sixty-two volumes of exchange journals. All of these became the property of the Colorado State Medical Society and are available at the Library in December.

The Executive Secretary, Mr. Harvey T. Sethman, made an interesting report on his management of the central office of the State Society. First he described his visit to the other State Societies in order to become familiar with various methods of running an office. Concerning Wisconsin he said:

"J. G. Crownhart, the Executive Secretary and managing editor of the Journal, is a former newspaper man and has had his office in operation about four years. He has an assistant and a stenographer-mailing clerk, and employs a newspaper writer part time. Their suite of offices is close to the State Capitol in Madison. In this situation, Mr. Crownhart emphasizes more than do other societies the matter of personal service to members. He makes a special point of the ability of his office to obtain for members every con-. ceivable sort of information available in the capitol that a member might desire, whether or not it is pertinent to organized medicine. I see no reason why we cannot gradually build up a similar service, and save many a doctor's time and expense in trips to the capitol.

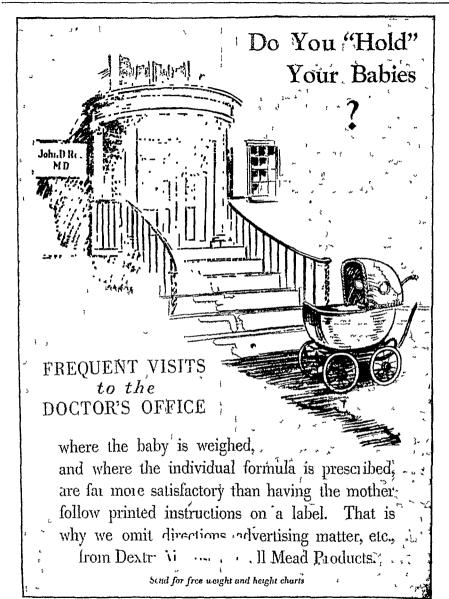

"He makes a special point of a monthy mimeographed bulletin to county society officers and committees, in addition to laying great emphasis on semi and quasi-medical news items in the Journal.

Comparing the Wisconsin Library with that of Colorado (see this Journal October 1, 1929, page 1230) Mr. Sethman says:

Mr. Crownhart emphasizes particularly a library service that I want to dwell upon for a moment, for so far as I know it is unique to Wisconsin—and yet our own Society has all the potentialities for the same work and I think we have failed to realize it. Wisconsin has worked out a plan of co-operation with the State Medical School Library. I do not believe it can be compared with our own library in either size or value, yet Wisconsin members get 50 times the service from their library that our members do from ours. The reason for our apparent failure is no fault of the library or librarian, it is simply lack of information as to what our library can do. We have the machinery, but we have never thrown it into gear. Let us take an example. Suppose you are an internist in Wisconsin. You have before you a peculiar case, difficult of diagnosis, one you have never heard of before. You write, wire, or telephone to the library, from any part of the state. You name to the librarian the probable diagnosis, one of which you think would apply. The librarian refers to an index, and in the next mail there goes out to you a new book or two and from one to a dozen recent jurnals containing the hest papers on those particular subjects. You pay the postage both ways and that is the only cost. You can understand better than can I, a layman, what this must mean to the isolated doctor in the small community. You can see also what it means to the man called upon to prepare a paper on an intricate sub-

Now then, our library is and has been prepared for years to give this very service. Yet look at comparative figures: Our library receives possibly one such request a week. In Wisconsin it is perhaps 100 a month, three or four a day. With the help of Miss Goehring, our librarian, I hope to inform our members systematically as to just what our library can do for them. Eventually it must mean an additional employee for the library, but I'm

(Continued on page 118-adv. xii)

# "Upon the Advice of My Physician"

THE majority of men and women who come to McGovern's Gymnasium to correct some physical condition are sent there directly by their physicians.

For more and more physicians are realizing the futility of leaving patients to their own resources when exercises are prescribed, and have learned that through individual attention at McGovern's, their instructions will be faithfully carried out.

A work-out will convince you of the superiority of the McGovern Method. Let us send you a guest card. No obligations, of course.

Mr. Sethman has this to say about the Indiana system of Popular Medical Education:

"Indiana's system of public education is divided into two parts: articles prepared for newspapers and magazines, and radio lectures.

"The release is sent in mimeographed form, to every newspaper in the state. It is impossible right now to go into detail, but suffice it to say that the program has worked wonders in increased friendship for scientific medicine and increased respect for the Society and for the profession. It has helped build the membership. These bulletins are issued over the name of the Bureau of Publicity of the Indiana State Medical Association, without signature by any one physician, are highly ethical, and approved by the A. M. A."

#### CONFERENCE OF STATE SECRETA-RIES AND EDITORS

The annual conference of secretaries and editors of the State Medical Societies was held on November 15 and 16, 1929, in Chicago, under the auspices of the American Medical Association. The Conference is outlined in the following description in the December issue of the

Pennsylvania Medical Journal:

"'The Public Activities Committee of the Nebraska State Medical Association.' by Dr. E. R. Hays, Falls City, Neb. The author detailed the activities, and laid stress upon the methods of lay education, especially taking advantage of a booth at the State Fair. Here lectures were given on first aid, pamphlets were distributed to those visiting the booth, five thousand being given out the first day, return visits made interesting friends, and physical examinations were made to demonstrate the value of periodic health examinations. A tabulated report was made of the discovered pathologic conditions in people apparently well. Letters were sent to two hundred who had been examined, requesting permission to forward the result of the examination to their attending physician. Of the replies received, 137 accepted the offer. The booth had between fifty and sixty activities (including numerous allied societies, associations, etc.) but all under the control of the State Society.

"'A State Medical Association Constitution and By-Laws.' Dr. George H. Kress, Los Angeles, Calif. This paper detailed the salient features of the constitution and by-laws of the California Medical Association, a copy of which

was distributed.

"'Why a State Medical Journal?" Dr. J. H. Musser, New Orleans. Dr. Musser considers

Physiologically tested leaves made into physiologically tested pills.

Convenient, uniform and more accurate than tincture drops.

Prescribe "original bottle of 35 pills" which protects the contents from exposure from the time of manufacture to the time of administration. This further insures dependability of action.

Each pill contains 0.1 gram, the equivalent of about  $1\frac{1}{2}$  grains of the leaf, or 15 minims of the Sample and literature upon request.

DAVIES, ROSE & CO., Ltd. Pharmaceutical Manufacturers, BOSTON, MASS,

(Continued from page 119-adv. xiii) abetted by a few physicians, to discredit, to hold up to public scorn, to destroy the well-earned prestige and the confidence of the people in, to humiliate, and no doubt most important to them and the real desideratum, to subjugate the medical profession. The very name of the undertaking, the cost of medical care, immediately and constantly suggests that the cost of medical care is too high, and the blame attaches to the physician. Why not use the term, 'The Cost of Illness,' or 'The Cost of Sickness'?"

#### STATE CARE OF TUBERCULOSIS CASES IN VIRGINIA

The President of the Medical Society of Virginia, writes a President's Message in the December issue of the Virginia Medical Monthly. Taking as his topic, "State assistance for tuber-

culosis cases," he says:

"While the State Department of Health is not asking the support of the Medical Society, I feel that the individual doctors should be tremendously interested in one proposal of the Health Commissioner. He is proposing to extend the State care of tuberculosis cases by paying a part of their board in properly run local sanatoria. He is proposing this instead of trying to enlarge the present State Sanatoria, which are now nearly as large as they should ever be The main purpose of the Department of Health is to help the local communities take care of the advanced cases, who are now spreading infection among their children. These cases frequently have to be kept in an institution for a long time, and now indefinitely fill up beds in our present sanatoria which should be used for apparently curable cases. The plan would save the State money because it would be relieved of the cost of building extra pavilions at the sanatoria, and at the same time would cut in two the cost of caring for the patients by the municipalities.

"This plan appeals to me, an old TB worker, as a great step in advance, for the old open cases of TB now prove the greatest source of infection and one which we have long been fighting to eliminate. I feel that all our medical men are interested in reducing the amount of tuberculosis in Virginia and can well say a good word for our Health Commissioner, and try to get for him the necessary authority and appropriation to put this measure into effect. The State Health Commissioner has expressed himself as earnestly desiring the cooperation of the Medical profession. His work is recognized all over the United States and anything that we can do to aid him in improving his work, as in the plan mentioned, is really incumbent upon those medical men who are trying to put Virginia again in the first rank among the States."

#### THE "HICK" TEST IN RHODE ISLAND

The December issue of the Rhode Island Medical Journal contains the following suggestive editorial on the "Hick" test:

"This may be described as a test of the patient upon the physician and merits a brief discussion. The Hick has been described many times in both poetry and prose. His attire, mental attitude, contemplative manner and characteristic speech are well known and need no description. He may at rare intervals be drawn on the grand jury or consult a physician. Fifty years ago the term farmer was used in opprobrium and commiseration, now one would curry favor with these stalwart and upstanding sons of toil and envy their bank accounts.

"Any busy consultant can offer a large number of instances and illustrations of the fact that despite the high standard of work done by most physicians, many patients consult them who have not had the most cursory physical examination We respectfully submit that it takes but a few minutes to look into the throat, observe the chest, palpate the abdomen and pursue any simple test which the patient's story shows to be needed. In a life insurance examination requiring forty minutes, 80% of the time is spent in taking the applicant's story. Unless some such examination as this is conducted, it is the physician who is the "hick" and reacts to a 100% positive Hick test We venture further to suggest that if the usual simple tests are performed in each case that there will be less need for the so-called "group practice," for the doctor can then send his patient to that specialist who can satisfy his mind upon doubtful points. It may be stated with positiveness that quite a few of the laboratory tests occasionally performed are of only suggestive diagnostic value and not determinate, and satisfy only a part of the diagnostic doubt in the case. The physical examination together with brief notes is the thing. Furthermore with this examination comes the revelation of the patient's needs and the necessity of further medical care and the more complete fulfilment of the physician's usefulness. With the auscultation of the cough comes the need of further observation. the examination of the rectum comes the need of a slight operation which may advance the patient well upon the road to health and comfort. With the auscultation of the abdomen may come the discovery of intestinal flatus or hyperperistalsis, suggestive of chronic disease, and the urinalysis may give reasons for an elaborate complex and allow the application of a medicinal and hygienic régime which may prolong life and increase usefulness. It must be said that unless we are thorough in our methods and complete in our examinations some of the caustic criticism of our

(Continued on page 122-adv. xvi)

Hindle Electrocardiographs It is Significant that over half of the Medical Colleges recognized by the A.M.A. have "Hindle" Electrocardiographs. A number of them have two or three instruments for Teaching, Research or Clinic. The New University of Iowa Hospital one of the largest teaching hospitals under University control has two Hindle Electrocardiographs -a No. 1 model for research and teaching, and a No. 3 Model Mobile Type for routine work. The latter may be wheeled to the patient's bedside and is operated from the lighting circuit. "The number 1 Model installed in the old hospital in 1919 is in very satisfactory condition as well as the No. 3 Mobile Model (installed in 1929). We are very pleased with our Electrocardiographic Unit." Send for literature

# DUES IN THE STATE SOCIETY OF WISCONSIN:

Over four pages of the proceedings of the House of Delegates of the State Medical Society of Wisconsin recorded in the November State Journal were devoted to the proposition to raise the State dues from ten dollars, as at present, to fifteen dollars. The first speaker, Dr. Beebe, called attention to the poverty of the rural Wisconsin doctors:—

"A year ago one of our past presidents made this assertion to me in a letter. We were arguing some of the things we argue, as we did last year. He said 'Where is the country doctor who does not take in at least \$750 a month and probably two or three times that amount?". Those are the very words he wrote.

"I went to the income tax collector of our district last spring and made inquiry as to the income of the doctors in a county adjacent to us, a county twice as wealthy as ours. The average net income of the men in that county was less than \$3,000."

Dr. M. G. Peterman of Milwaukee said:

"Times are just as hard in the city, and I think for the young man starting into practice today the overhead is something which causes him considerable worry. While he may get a great deal more service if he pays fifteen dollars dues, he could probably get a lot more service out of a Pierce-Arrow when he has to buy a Ford. If the Society were short of funds, if there were some good reason for raising the dues, perhaps we would be justified in making a change, but since the reasons advanced are for the purpose of expansion, I feel it is time to stop and see how far a State Society should expand."

The only new work that it was proposed to undertake was the employment of a medical man as full time editor of the Journal at a salary of \$10,000. Dr. Peterman continued:

"Certainly there are today more national and international medical journals, self supporting, entirely satisfactory, than any one man can read. It hardly seems advisable to raise the standard of the Wisconsin Medical Journal to add to the tremendous literature which we already have. If the State Journal contents itself with reporting the state meetings, perhaps publishing the Blue Book and

(Continued on page 123-adv. xvii)

(Continued from page 122-adv. 1v1)

saving considerable expense, publishing case reports of general interest, public news and other events of general interest to the men in the state, has it not fulfilled its function?"

Dr. Cowles of Green Bay said

"It seems rather out of place to me that we should sit around here and dicker about five dollars a year, when you think of it as a monetary consideration. I am sure if I voted to increase the dues I would be severely criticized by the society. It seems to me we should decide whether we want additional help in the State Society and whether we want o expand and take on additional expense."

Dr. Fiedler of Sheboygan said:

"I am reminded of a meeting in Green Lake five or six years ago when the dues were raised from five to ten dollars a year. There was the same argument. Just the same discussion took place as is taking place this evening. The dues were raised from five to ten dollars, and instead of losing members the Society has increased its membership continually since then, and the Society has made wonderful progress in that period of time."

Dr. Smiles of Ashland said:

"I am a better listener than speaker, for the reason that I stayed up until three o'clock this morning trying to earn my dues for next year, no matter what they may be. I started at seven this morning and drove down here, something like 330 miles. A good deal of that road had been deluged by four days of rain, so that my idea of the difference between ten and fifteen dollars now is not very clear."

This question of increased dues was finally

laid on the table.

## HEALTH WORK IN SCHOOLS OF BURLINGTON COUNTY, N. J.

The December issue of the Journal of the Medical Society of New Jersey contains a report of the one hundredth annual meeting of the Burlington County Medical Society on November 13, 1929, at which the following statement of policy was unanimously adopted:

"Medical and surgical corrective measures are primarily responsibilities of the home. The school purposes are, first, to determine health needs of the pupils and to inform the parents of those needs and the best procedure for meeting them; and second, to educate the pupil for healthful living. The school is not concerned with establishing and operating clinics, dispensaries or infirmaries in opposition to the medical and dental professions or to such facilities already established in the community.

1701 DIAMOND ST. PHILADELPHIA

1826—George Tiemann & Co.—1930 107 East 28th Street New York, N. Y. (Continued from page 123-xvii)

"The exceptions to the above are, under acceptable conditions, as follows: (1) diptheria prevention by means of immunization; (2) dental correction when the number and the practice of local dentists necessitate supplementary procedures; (3) special classes for crippled children, the impaired in vision or hearing, the malnourished and pretuberculous, the child with speech defects, and the mentally subnormal; (4) known indigents when corrective measures for some reason will not or cannot be undertaken by the parents and when the defect is a decided handicap to the pupil's health and progress at school.

"In view of this general policy, the school does not need to have on-hand a large quantity or a great variety of drugs and supplies. It should, however, be prepared to meet general emergencies with first aid measures."

#### PROSECUTIONS FOR ILLEGAL PRAC-TICE IN NEW JERSEY

The December issue of the Journal of the Medical Society of New Jersey contains a report by Dr. C. B. Kelly, Secretary of the New Jersey Board of Medical Examiners, describing twenty-two cases of prosecutions for the illegal practice of medicine coming before the Board during the six months, June to November, 1929. Evidently the Board can accept a plea of guilty and impose a fine or a jail sentence. Seventeen paid a fine, and two were sent to jail for five days. Two cases appealed to a higher court, and one, a second offender, will be tried in a regular court of law.

The kind of practice done by the defendants was as follows:

Druggist6
Midwife1
Institution of Christian Psychology1
Health Resort1
Naturopath (second offense)1
Chiropractor unlicensed
Herbalist1
Cancer Specialist1
Tuberculosis Cure1
Physiotherapist1
Osteopath, licensed but practising
unpermitted forms of theraphy1

# DISTRIBUTION OF PHYSICIANS IN OHIO

The distribution of physicians in rural sections has received consideration in all parts of the United States. The December issue of the Ohio State Medical Journal reports a study of

(Continued on page 125-adv. xiv)

(Continued from page 124-adv xvii)
Ohio, in which the following conclusions are reached.

1. The supply of physicians in Ohio is estimated to be adequate to meet the demands of

the population.

2 Medical service in Ohio is, in general, equitably distributed, only a few counties suffering from what might be deemed a serious shortage of physicians in relation to their population.

3 The percentage of physicians in Ohio in proportion to the population is about equal to

the average for the nation.

4. Seventy of the 88 counties of the state have one or more hospitals or institutions where hospital service or similar services may be obtained.

5. All but one of the 18 counties lacking hospital facilities have a percentage of planeaus to population that is smaller than the average for the state

6 Ohio ranks 19th among the 48 state n

percentage of physicians to population 7. Ohio is ninth among the states in the number of physicians per 100 square miles the ratio being slightly over four times the ever age for the nation.

S Approximately half of the practicing physicians of the state are residents of one of the eight larger cities.

 All but one of these eight large urban districts show a percentage of physicians to population larger than the average for the state.

10. Forty and eight-tenths per cent of the total population of the state reside in these eight cities

11. Sixty-six per cent of the total number of physicians licensed in Ohio are members of organized medicine. Approximately 90 per cent of those eligible to membership are active members of the State Association. This is discussed more fully along in this article.

"The outstanding, definite conclusion shown by the state survey is that there is no genuine shortage of physicians in Ohio generally. While the figures reveal that medical service is poorly distributed in some sections of the state, they also show that the situations are not so serious that they cannot be met by readjustment of economic conditions.

"The survey bears out the conclusions reached by the Medical Economics Committee of the Ohio State Medical Association in its 1929 annual report of the House of Delegates

Alka-Zane is a granular, effertescent salt of calcium, magresium, sodium and potassium carbonates, citrates and phosphates. Dose, one teaspoonful in a glass of cold water.

WILLIAM R. WARNER & CO., Inc. 113 West 18th Street New York City IS acidosis delaying the results of treatment? Even a small change in the acid-base balance is dangerous and enously interferes with effective therapy. GAcidosis can be ruled out by supporting the alkali reserve with Alka-Zane. It contains the basic salts in physiological proportion. G We will gladly send a twin package, with literature, for trial.

Alka-Zane
for Acidosis

# PUBLIC RELATIONS OF THE MEDICAL PROFESSION

The discharge of the civic duties which devolve upon the medical profession is being considered in almost every medical group that meets for discussing medical problems. The leaders in medicine are convinced of their civic duties; their great work in the immediate future will be to convince the great mass of physicians who belong to medical societies in a passive way. The December issue of the Ohio State Medical Journal says editorially:

"The day when the physician could delegate to others his interest and responsibility in social and economic questions has passed; and the new era, with its changes in social and economic orders, has been accompanied by additional and multiplied responsibilities for the medical profession, both individually and

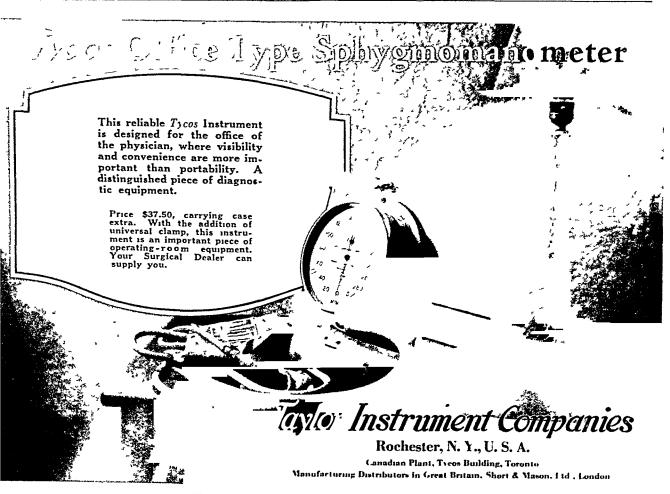

collectively.

"Numerous public statements made within recent months, both by leaders in the medical profession and by the laity, emphasize the point that the time has arrived when physicians must abandon a passive attitude toward questions involving the social and economic factors of medical practice, medical service and public health.

"The sentiment expressed by many of these writers and lecturers indicate that the public is expecting the medical profession to take the lead on questions pertaining to medical service and public health, and that the public does not expect the medical profession to shirk its responsibilities in bringing about readjustments, should they be found necessary after thorough investigation of the facts.

"There is naturally a wide difference of opinion both in and outside of the medical profession as to what readjustments, if any, should be made in the economics of medical and public health service to the public. Attempts to arrive at a mutual understanding of the situation are now being made.

"However, there are a few who will disagree with the statement that the medical profession should assume the leadership in all studies of the many involved questions and show the public that it is interested in trying to solve them or analyze and explain them in a way that will be satisfactory and beneficial to all concerned."

# PELLAGRA PREVENTION IN KENTUCKY

The December issue of the Kentucky Medical Journal has the following editorial on pellagra.

"In Kentucky in 1928 there were 165 deaths from pellagra. Pellagra is not infectious or contagious and yet our records would indicate thousands of cases. Success in the treatment of this disease depends a great deal on the early diagnosis. Investigations by the late Dr. Goldberger of the U. S. P. H. S. have proven that pellagra is due entirely to faulty diet.

"A complete and full diet is essential in the treatment of pellagrins. Meat, milk, fruits and vegetables must be taken in liberal quantities. Extensive experiment has shown that dried yeast contains relatively large amounts of the 'pellagra preventive vitamin.' This yeast is not the ordinary yeast used in making bread but is dried

brewers yeast.

"The State Board of Health of Kentucky has a supply of this yeast and will send it by mail on receipt of the price as follows:

"Green label dried Brewers yeast, \$0.80 for 2

pound sack.

"Red label dried Brewers yeast, \$1.00 for 2

pound can.

"The Red label yeast has been debitterized, that is, it has had the hop taste removed."

# THE MAINE JOURNAL

The question of combining the Maine Medical Journal with the New England Journal of Medicine has been considered in former years and is mentioned in the following editorial in the December issue of the Maine Journal:

"To join our efforts with those of the other New England States in producing a more representative New England journal has been suggested as an alternative course. This would doubtless be an easier solution of the problem than an attempt to improve our own publication; but the easier way is by no means always the best. State medical journals are not commercial enterprises. The Association must understand this, and be willing to finance our Journal in excess of its possible earnings.

"Our state, situated as it is rather remote from centers of great activity and thought, needs the Journal to link it more closely with these centers. With your help, this contact with the medical world can be satisfactorily maintained. Much of all that happens and is published of medical interest finds its way into the office of the Journal. It is our task to make this material of more practical use to the physicians of Maine.

The editors of the New York State Journal of Medicine would miss the Maine Journal if it were merged with another.

# A NEW AGENT FOR THE TREATMENT OF HEM-ORRHOIDS

Theoretically, the treatment of hemorthoids should probably in most cases le radical. In practice it is very often not possible to convince the patient of this, and the actual treatment followed will then be medical, i. e., palliative and corrective. A few months ago there was placed on the market a suppository incorporating a new anesthetic, Niketol, as well as the other agents usually employed for the purpose. Clinical results seem to have fully borne out the claim of the manufacturers that this new local anesthetic, an association of ethyl phthalamate and para-amino-benzoic-amino-ester, is particularly well absorbed through the mucous membranes, and gives immediate relief without any of the after-effects frequently associated with other local anesthetics. To overcome the objection often made to suppositories, that they act as a foreign body in the rectum, the melting point of these Hemorem Suppositories has been l

held as low as possible without seriously impairing the keeping qualities. The manufacturers, Niketol, Inc., will be glad to furnish samples and literature on request.—See page x.—Adv.

# BABYGAIN

BabyGain—made from fresh tuberculin-tested milk produced under rigid sanitary control, modified and powdered a few hours after milking—besides being a correctly balanced food for all babies—is especially valuable in cases where breast feeding needs to be supplemented.

Hospitals, nurses and physicians have found this powdered, modified milk the ideal substitute for mother's milk.

BabyGain requires only the addition of water to provide an infant diet that conforms both chemically and characteristically to the average human milk and may be readily adjusted to meet individual requirements. See page xiii.

—Adv.

# VITA GLASS

Vita glass has been subjected to numerous accelerated weathering tests by the U. S. Bureau of Standards, by Professor Stockbarger of the Massachusetts Institute of Technology, and by many other physicists. These physical or quantitative tests, as well as biological experiments with rats and chickens, have established the fact that the solarization (weathering or seasoning) of Vita glass takes place quickly; and that after a few weeks' of actual use its transmission of ultraviolet light becomes constant.

Vita glass is being marketed primarily as a health prophylaxis and not as a therapeutic agent; although it is now serving in the latter capacity in numerous well authenticated instances—particularly in the solaria of more than 20 hospitals in England and the United States.—See page vii.—Adv.

# THE TRUE STORY OF ACTEROL

To get the real facts on this important subject, do not fail to look for the special color supplement in the Journal of the American Medical Association for January 18.

In the meantime, please see the Mead Johnson announcement in this issue also entitled "The True Story of Acterol." See page xi.—Adv.

# LILLY RESEARCH LABORA-TORIES

Years of experimentation and thousands of clinical tests are necessary before sufficient is known of some products to warrant offering them for medical use. After long study, many discoveries of early promise may be found inapplicable.

In the co-operation of the Lilly Research Laboratories with the original investigators in the commercial development of such discoveries as Insulin, Para-Thor-Mone, and Liver Extract No. 343 ample time was taken to demonstrate their action clinically before they were released for sale

they were released for sale.

The refinements of Lilly antitoxins, smallpox vaccine, rabies vaccine, and other biologicals have been attained at the cost of years of patient work on the part of the Lilly Research Staff.

See Color Insert.—Adv.

# A FOOD DRINK

It is a well-known fact that the administration of suitable nourishment just before retiring is very effectual in inducing natural, restful sleep and this applies particularly in the treatment of insomnia and many extremely nervous conditions.

A food-drink that is palatable, easily digested, rapidly assimilated and particularly appropriate for nourishment at the hour of retiring may be quickly prepared from the following formula:

Mellin's Food Water Milk 4 level tablespoons 1/2 coffee cup 1/2 coffee cup

See page ix.—Adv.

# CONFERENCE OF COUNTY SOCIETY OFFICERS IN IOWA

The Journal of the Iowa State Medical Society of December, 1979, has the following account of the fall meeting of the County Society officers:

"Thursday, November 7, upon call by Dr. John H. Peck, the officers of the county societies of the state, together with the councilors and deputy councilors from the various districts, convened in an all-day session at the Hotel Fort Des Moines. Des Moines, Iowa. This conference is the fourth of this sort to be held, and was by far the most generously attended. One hundred and thirty-six officers were present.

"Dr. Tom B. Throckmorton of Des Moines, secretary, presented the subject of society memberships, discussing the accomplishments of the past year in stimulating interest and enrolling physicians in both the county and state organizations. He presented plans and suggestions for furthering this campaign, especially emphasizing the importance of bringing inte membership the one hundred new physicians who were beginning practice in Iowa this year. Dr. D. C. Steelsmith of Des Moines, deputy state commissioner of health, spoke on the subject, "The County Health Unit." In this paper he explained the purpose and operation of the new county health unit law. Dr. A. V. Hardy, director of the State Diagnostic Laboratory at Iowa City, delivered a paper on "Laboratory Service" in which he outlined the advantages of having diagnostic laboratories located in the northwest, northeast and southwest quarters of the state.

"Dr. R. F. Childs of Audubon reported for the Committee on Medical Economics, stating the problems being attacked and asking that similar situations be referred to the committee since they would throw light on the various subjects being investiA well known Urological Journal says:

gated. The members of the Committee on Medical Education and Hospitals, Dr. B. L. Eiker of Leon, Dr. A. W. Erskine of Cedar Rapids, and Dr. A. V. Hennessy of Council Bluffs, told of the great task being undertaken and urged that all county officers be prepared to assist the committee in collecting vital data.

"At 12.30 p.m. a luncheon was served at the Hotel Fort Des Moines, at which Dr. W. A. Rohlf presided. Following the luncheon, Dr. Channing G. Smith. Granger, chairman of the Council, Dr. John F. Herrick of Ottumwa, trustee, Dr. George C. Albright, secretary of the Johnson County Society, and Dr. Frank P. Winkler, deputy councilor of Osceola county, delivered short talks."

### ADVERTISING BY COUNTY SOCIETIES IN WASH-INGTON

The December issue of Northwest Medicine contains the following account of the medical advertising plan of the Pierce County Medical Society of the

State of Washington: "Dr. C. C. Leaverton made a report for the Publicity Committee and outlined their plans for making a contract with an advertising agency to carry on a program of public health education through the daily papers of his committee. He said that this plan has received the unanimous approval of the Board of Trustees and of every member of his committee. He said that the carrying out of the plan would depend on the voluntary subscriptions of members of the society and that about \$5,000.00 would be necessary. Dr. Leaverton then made a motion that this plan be approved by the society and that the committee be authorized to get the necessary funds by subscription. A great many questions were asked Dr. Leaverton and a general discussion followed, after which the motion was upanimously carried."

A FAULTY gauge once discredited a long series of measurements made by a famous investigator.

In the production of pharmaceuticals and biologicals fidelity to formula, and scrupulous care in weighing and measuring are in vain if the weights and measures are inaccurate.

In the Lilly Laboratories the equipment for maintaining accuracy in these essentials consists of two sets of standard weights and measures and a balance designed for verifying and adjusting weights. One of the two sets of weights and measures is a working set, the other a reference standard used to control the working standard. All are adjusted within the tolerance limits prescribed by the United States Bureau of Standards.

Deficient weights and measures are corrected or discarded and destroyed. In the Lilly Laboratories each weight and measure is numbered for identification. This number is entered on a card on which is recorded the dates of its inspection and condition.

Scrupulous care in testing weights and measures is but one of the many means taken to make Lilly Products true to label in respect to both quantity and quality.

### EAR INFECTIONS IN BABIES \*

By MARVIN F JONES, M.D., FACS and JOSEPH M GERSTLY, M.D., NEW YORK N.Y.

From the Otological Department of the New York Post Graduate Medical School and Hospital

THE recent attitude of doctors regarding ear infection in bibles has possibly led us to deviate from the path of necessary conservative surgery. It is generally conceded that the infant and adult mastoid present two distinct diagnostic and treatment problems to the otologist

The first essential in a discussion of the subject is an accurate definition of the nomemel; The word "infant," for ex ture employed ample, from the viewpoint of the mother is from the cradle to the grave. From the viewpoint of the law, it is the first twenty one years of life. From the viewpoint of the diction iry it is described as 'the new born babe' therefore, necessary to limit the terms of life included in the phrase, infant in istoiditis?

In an attempt to standardize anatomically these periods it is necessary to consider the various stages of development from birth to maturity. In a review of authorities we find very conflicting statesments regarding this development, the period of complete development being spread over a term of from one year to puberty

The anatomists are quoted as follows -

Gray, "Mastoid cells, like the other sinuses of the cranium, are not developed until after puberty "

"The mastoid process becomes Piersol fairly distinct in the course of the second year It develops gradually about the time of puberty when it becomes preumatic. This may occur much earlier'

Deaver, "Prior to puberty the mastoid cells are few in number. They attain their full development in the voung adult"

Cunningham "The Mastoid process begins to develop in the second year

The anatomists agree on a period liter than the actual beginning and complete development of the mastoid as evidenced by the above opinions

We all realize the difficulty of satisfactory 1 ray examinations which might be of inmense value in determining the stages of development. Three works on this subject commend themselves for consideration. Chertle in 1906, stated as a result of his research that infant mastoids show cellular development within the first five years after birth. The carliest picumitic mastoid he found wis at the age of one year and seven months

Stewart stated before the New York Aca demy in 1913 that as a result of his radio graphic investigations he was convinced that distinct well formed, pneumatic cells were present as early as two years of age. In his article he quotes Dr Sidney Lange, who is probably the pioneer in this subject, to the ef fect that no cells are visible under ten years of ige, that the pneumatic characteristics vary from ten to fifteen years of age. This paper was read in 1909 before the American Roentgen Ray Society, and since that time the technique employed by radiographers has been sufficiently improved to make more recent information on this subject more accurate

Bigelow and Guerber in the year 1923 pre sented their results and used the opinion of Wittmarck that a mistoid which is not completely pneumatized by the end of the third year or it the very latest, by the end of the fifth year never becomes so liter

We find among the authors of books on otology the following opinions —

Politzer, "The tympanic antrum is the only pneumatic space present in the temporal bone in the new born. It is absolutely larger than the adult

Dench 'In the infint at birth the mist ad is but poorly developed, consisting usually of but a single cell the antrum

Kopetsky states that at the end of the first

\* Read at the Arnual Meeting of the Me I cal Society of the State of New York at Linca N Y June 6 1979

year pneumatization begins, at the end of the third year the mastoid process may already resemble the adult type, and he has observed a mastoid process in a child of two years which in no way differed from the adult type.

While these authorities have cited various periods of life as the period of complete development, or lack of development, there has been no record that we have been able to find of an attempt to state in detail the average sizes of mastoids from birth to complete development. This should be simple and considering the importance of the difference in treatment between a completely developed or partially developed mastoid and an undeveloped mastoid, it seems rather strange that a procedure so simple has not been published. This could be accomplished by measuring the mastoid excavation at the time of operation, then tabulating these measurements together with the age of the patient. A sufficient series would furnish us the information desired. In the absence of this information, we have attempted to demonstrate roughly the size of mastoids by means of dry dissections of several subjects. The conclusions drawn from these dissections are-first, that the mastoid process has pneumatized cells at a much earlier age than is commonly supposed. The reports of various cases, of which the report of the case by Dr. Bass, of Louisville, is an example, show that there is a development of mastoid cells in some cases before one year of age. In this report he states that he had a case of bilateral well-developed mastoids in an infant six months old and weighing eight pounds six and one-half ounces.

We also conclude that mastoids at various stages of development mechanically demand different methods of treatment.

We believe that too much dependence has been placed on the spontaneous resolution of mastoids in the infant, because the period of development and the anatomical location of, structures have been overstressed as factors aiding resolution.

The quotation is frequently heard, "The mastoid is not involved because there is only a single cell, i.e., the antrum present." statement cannot be made at any age over six months and be within reasonable limits a truthful statement.

There seems to be a feeling among otologists and pediatricians that the mastoid antrum is the only cell in the mastoid process up till the time the child is about five years old. The tendency to lengthen this age limit is increasing. The single cell idea combined with the knowledge of the anatomical difference between the child and adult mastoid have given a false sense of safety when dealing with an acute vastoiditis.

In order to place our presentation in definite chronological form we would like to divide our periods of development into four periods. Let us call the time elapsed between birth and the end of the eighteenth month the first period; the second eighteen months or until three years of age the second period; the next eighteen months or until four and one-half years age the third period; and from four and one-half years until death the fourth period. For all practical purposes a mastoid that is not developed at four and one-half years will in all probability not be developed during life. Therefore the treatment of an acute mastoiditis after four and one-half years of age will not differ from the treatment of an adult mastoid. We are not particularly concerned in this

paper with the fourth period.

1. Anatomy. The mastoid consists of one cell, namely, the mastoid antrum, larger than the adult, placed above and posterior to the middle ear cavity. The additus ad antrum is nearly perpendicular, relatively large in lumen, and short. The Eustachian tube is relatively short, more nearly horizontal, relatively large in calibre. The additus it easily closed by inflammation of embryonal tissue in the first six The Eustachian tube serves as casy entrance for infected material from the nose and throat and also acts in the capacity of a drainage tube for the middle ear when it contains pus under pressure. The membranatympani is thicker and more resistant during the early infancy periods. Embryonal tissue persists in the superior part of the middle ear, as folds in the membrane which is easily infected and changed in character. Exceptions to these rules occur frequently, of which exceptions the fact that pneumatized cells may be present in considerable numbers during this period is important. It is during this period that infection of the tympanic cavity or the mastoid antrum is most apt to occur. Under proper treatment it is also the period during which there is the highest percentage of cases which resolve. This resolution is due in a great degree to the anatomical structure.

2. Diagnosis. The diagnosis of infection in the middle ear and antrum during this period is perhaps the most important subject in recent discussions. Infection in the middle ear has been diagnosed by various changes in the appearance of the membrana tympani. These changes being characterized by primary retraction, loss of lustre, loss or distortion of the light reflex, congestion and redness in Shrapnell's area, and the early appearance of a pinkish blush of the tympanic membrane, followed later by redness, bulging, loss of landmarks, and a blending of the supero-posterior portion of the drum with the supero-posterior canal wall. The involvement of the mastoid

antrum is indicated by the drooping or prolapse of the superior-posterior canal wall, and the superior-posterior quadrant of the drum I his change obliterates the line of division between the drum membrane and the canal wall, at the annulus tympanicus To this is added, by means of rupture of the drum membrane, a profuse purulent discharge, more than would probably come from the middle Swelling, tenderness, redness over the mastoid process, and a diminution of the postauricular fold have all been considered signs of pathology in the middle ear and antrum that called for surgery. In addition to these signs, there are also the following general symptoms, fever, restlessness, pain, tenderness and coated tongue Laboratory examination adds a leukocytosis to the picture. The 4-ray The above has been of no practical value findings have been the accepted description of an acute of its and mastorditis during the first neriod.

During recent years records have been piesented by our western pediatric and otolaryn golic confreres which make us realize a new era has arrived Our accepted diagnostic facts have These spectacular records been supplemented are largely the result of real combined thought and conference at the bed-side. We in the east have been altogether too slow in following The additional facts we must now consider are more in the province of the pediatrician than the otologist. They are the general symptoms of a local infection. Among the reported gen eral symptoms are loss of weight dehydration, anemia diarrhea, vointing, inforcation, fever, loss of appetite, drowsiness, stupor and pallor These symptoms follow involvement of the gastro-intestinal tract. In addition we must consider the respiratory and genito urmary systems which we know are sometimes involved. Then include the vascular and nervous systems which should be occasionally

The diagnostic ability of the otologist is also taxed in this more recent otology The mag milying otoscope is now a necessary part of the diagnostic equipment. The minute changes in the drum are most important and are not visible by the unaided vision. With the electric otoscope, the quality, color, tone and vascu larity of the drum head become clear. In this new picture we have a membrane which ap pears thickened in the superior posterior quad rant the color is grey which resembles dirty tissue paper The membrane is atonic and when negative and positive pressure are after nated the membrane fluctuates with wide ex The blood vessels are diluted and tortuous especially in Shrapnell's area. They may extend along the malleus handle or cross the membrane. This entire picture is one of detail and one which when observed by the unaided vision, would give the impression of a normal drum to the examiner

Hand in hand with this more refined and scientific study should go a warning This same refined and scientific study which has been laboriously conducted without fear and with most altruistic ideals opens a wide avenue for the advance of sordid medicine This type of medicine is characterized by predominance of a desire for financial gain and by the desire to shift responsibility of a serious case practitioner is loath to spend the time to learn He will not admit his mability to see, understand and diagnose all conditions and assumes a position on a pedestal which has a foundation This individual and his confreres, seek an excuse rather than a cause for opera He will operate rather than spend time to study the case and arrive at a legitimate diagnosis. In accepting these new methods, therefore again the warning, "Proceed with increased vigilance"

The training by otologists who Treatment advocate early myringotomy has left an in delible impression upon the authors procedure has a definite technique and is never a "Stab in the dark' Start the incision at the six o'clock position with the knife blade up ward, incise parallel to the posterior portion of the annulus tympunicus up to the eleven o'clock position. Turn the blade in the direction of the additus ad antrum and continue the incision for a short distance into the canal This insures the maximum drainage from the middle ear cavity, the epitympanic area and the additus Paracentesis has no place in modern otology, myringotomy only should be considered. We believe there is a definite value in the repetition of this procedure so long as a cessation of discharge coincides with a rise in temperature. The repetition to be terminated if mastoiditis of the type that will not resolve is diagnosed. The supposed middle car destruction from repeated myringotomies will be considered in a paper by Crowe and Guild some time in the near future

To condense the treatment we will tabulate

Tubo Tympunitis

- 1 Argyrol 10% 25% in each side of nose three times a day
- 2 Cathartic
- 3 Lorced fluids
  - The heat from massive arrigation of the car

O. M. C. A Otthy Media Cutarrhal Acute (with fluid)

1 Myringotomy

pneumatization begins, at the end of the d year the mastoid process may already emble the adult type, and he has observed aastoid process in a child of two years which no way differed from the adult type.

While these authorities have cited various eriods of life as the period of complete de-elopment, or lack of development, there has een no record that we have been able to find of an attempt to state in detail the average sizes of mastoids from birth to complete development. This should be simple and considering the importance of the difference in treatment between a completely developed or partially developed mastoid and an undeveloped mastoid, it seems rather strange that a procedure so simple has not been published. This could be accomplished by measuring the mastoid excavation at the time of operation, then tabulating these measurements together with the age of the patient. A sufficient series would furnish us the information desired. In the absence of this information, we have attempted to demonstrate roughly the size of mastoids by means of dry dissections of several subjects. The conclusions drawn from these dissections are-first, that the mastoid process has pneumatized cells at a much earlier age than is commonly supposed. The reports of various cases, of which the report of the case by Dr. Bass, of Louisville, is an example, show that there is a development of mastoid cells in some cases before one year of age. In this report he states that he had a case of bilateral well-developed mastoids in an infant six months old and weighing eight pounds six and one-half ounces.

We also conclude that mastoids at various stages of development mechanically demand different methods of treatment.

We believe that too much dependence has been placed on the spontaneous resolution of mastoids in the infant, because the period of development and the anatomical location of structures have been overstressed as factors aiding resolution.

The quotation is frequently heard, "The mastoid is not involved because there is only a single cell, i.e., the antrum present." statement cannot be made at any age over six months and be within reasonable limits a truthful statement.

There seems to be a feeling among otologists and pediatricians that the mastoid antrum is the only cell in the mastoid process up till the time the child is about five years old. The tendency to lengthen this age limit is increasing. The single cell idea combined with the knowledge of the anatomical difference between

-bild and adult mastoid have given a false of safety when dealing with an acute ditis.

In order to place our presentation in definite chronological form we would like to divide our periods of development into four periods. Let us call the time elapsed between birth and the end of the eighteenth month the first period; the second eighteen months or until three years of age the second period; the next eighteen months or until four and one-half years age the third period; and from four and one-half years until death the fourth period. For all practical purposes a mastoid that is not developed at four and one-half years will in all probability not be developed during life. Therefore the treatment of an acute mastoiditis after four and one-half years of age will not differ from the treatment of an adult mastoid. We are not particularly concerned in this

paper with the fourth period.

1. Anatomy. The mastoid consists of one cell, namely, the mastoid antrum, larger than the adult, placed above and posterior to the middle car cavity. The additus ad antrum is nearly perpendicular, relatively large in lumen, and short. The Eustachian tube is relatively short, more nearly horizontal, relatively large in calibre. The additus it easily closed by inflammation of embryonal tissue in the first six The Eustachian tube serves as easy entrance for infected material from the nose and throat and also acts in the capacity of a drainage tube for the middle ear when it contains pus under pressure. The membrana tympani is thicker and more resistant during the early infancy periods. Embryonal tissue persists in the superior part of the middle ear, as folds in the membrane which is easily infected and changed in character. Exceptions to these rules occur frequently, of which exceptions the fact that pneumatized cells may be present in considerable numbers during this period is important. It is during this period that infection of the tympanic cavity or the mastoid antrum is most apt to occur. Under proper treatment it is also the period during which there is the highest percentage of cases which resolve. This resolution is due in a great degree to the anatomical structure.

2. Diagnosis. The diagnosis of infection in the middle ear and antrum during this period is perhaps the most important subject in recent discussions. Infection in the middle ear has been diagnosed by various changes in the appearance of the membrana tympani. These changes being characterized by primary retraction, loss of lustre, loss or distortion of the light reflex, congestion and redness in Shrapnell's area, and the early appearance of a pinkish blush of the tympanic membrane, followed later by redness, bulging, loss of landmarks, and a blending of the supero-posterior portion of the drum with the supero-posterior canal wall. The involvement of the mastoid

mastorditis has been diagnosed it is a dan gerous risk to delay for spontaneous recovery

to take place

Suppose the patient with an operative mas toiditis is not operated. That cases of spontaneous recovery do occur is not denied Operative appendicitis cases also recover, but no one questions the proper procedure is sur gical When a definite mastoiditis is present, with the chances of recovery slight, it is just poor surgical judgment to delay Complications causing disability and death do occur in these cases Meningitis is a rather common termi The autopsy is proving that more cases of meningitis originate from undiagnosed middle ear conditions, than has been formerly supposed Especially in cases which have an examination of the temporal bone post mortem does this become evident

Deafness is a condition to be seriously considered as a result of "Spontineously Resolved" cases Too little attention has been directed toward this point. In a few cases of so called deaf mutism, we have examined, a vestige of the hearing function has been present Total destruction of both tympanic mem branes give mute evidence of the destructive process which has at some time been present Coloric tests reveal the presence of vestibular tunction. In cases with the drum membrane in tact, this picture singularly resembles the one seen in "Latent Mastoiditis" It would seem feasible, therefore, to consider some of our congenital deafness cases as those whose hearing has been destroyed by early degenerative processes

### Table II

This table shows an unselected series of mastoid operations occurring on four different services at the New York Post Graduate Medical School and Hospital

Of 252 operated cases

69 were operated during the 1st year 68 were operated during the 2nd year 36 were operated during the 3rd year 30 were operated during the 4th year 18 were operated during the 5th year 20 were operated during the 6th year 11 were operated during the 7th year

# Lotal 252

Progressive loss of hearing is a valuable in dication for operation on the adult mastoid This valuable sympton is of course, lacking in the young baby I hat a loss does occur could hardly be doubted. It is our belief that proper examination and treatment during these early vears is the best means of preventing the deafness of later years

A continued low grade discharge from the

ear, especially if small in amount, is apt to be disregarded by the parents. Some of these cases have a discharge so slight as not to be noticed in the canal. We would be unwilling to class this as a complication, but it is from this type of case that our later day intracranial cases take origin. The history is rather stereo typed

The patient complains of nausea, dizziness difficulty in locomotion, pain in the head which keeps him awake. He is irritable, feels tired and looks sick. On being questioned he re plies that he has a discharge from one or both ears with impaired hearing as long as he can remember The mother says this was started when he was a baby. On examination one or both ears has a thick foul smelling discharge The car shows advanced destruction and at tempt at repair Labrinthine and intracranial complications are immediately considered. The prognosis is not good. If the mastoid is opened we find the sclerotic type with the sinus well forward and low middle fosse. No cells are present except the antrum of the so called in fantile mastoid. We prefer to consider these cases of arrested development due to destruc tive processes occurring at the critical age when the mastoid cells are beginning to form

Sinus Thrombosis, Betzold perforation, subperiostal abscess upidural abscess and other conditions might be added to the list which result

from delay

In addition to local involvement the time has arrived when latent and acute mastoiditis must be classed among the known locations which serve as a focus for general infection The cholera Infantum Syndrome in connection with infection in ears has been convincingly es tablished The kidneys are now being con sidered in the light of our new knowledge Chest conditions should most naturally follow The blood stream and nervous system are surely to be considered

### CASE REPORTS

S M-This child was admitted to the hospital at the acc of nine months ten days suffering from vomiting after meals. Since the last six weeks he was under supervision in the Periatric Clinic, but did not do so well at home. The stools were watery

The diagnosis on admission were

I Pyloro spasm and stenosis

Cerebral irritation Bilateral OMP \

Acidosis

Secondary dehydration

Three days after admission the child was given a transfusion of two hundred ec of whole blood and about three weeks after admission a bilateral mastoidectoms was done under local anaesthesia the cultures were re turned as pneumococcus type four. The next day an other transfusion was given of 150 cc whole blood

The weight at admission was fourteen pounds six ounces and fluctuated in the first three weeks between fourteen pounds six ounces and fifteen pounds eight ounces. Three weeks and two days after admission the child's weight dropped to thirteen pounds, twelve ounces and then he passed out with the diagnosis of marasmus. The temperature during the child's stay was about one hundred and two and that was only for a short time, at two separate times, about two weeks before he died.

Otherwise temperature was below one hundred and two.
The autopsy was: unresolved, bilateral bronchopneumonia, chronic fibrous pleurisy, chronic catarrhal enterocolitis, and marasmus. Operation was too long delayed in this case. Local antrotomios add little danger and these cases resolve slowly, if at all, when operation

is not done

F. M.—This child, the first of twins, was admitted to the hospital at the age of one month, seventeen days, with the chief complaint of vomiting after feeding. twin was also constipated. On admission the child weighed five pounds, fifteen ounces and when discharged he had a little cough, but physical examination of the chest was negative. Weight was six pounds, fifteen

ounces when discharged.

He was discharged on May 21st, and just one month later both ears started running and since that time the child has persistently failed to gain, and vomited at times. The child was admitted with the diagnosis of bilateral mastoiditis. Both mastoids were opened and drained. The week after the operation ninety cc. of blood was transfused. This transfusion was given for a sudden rise in temperature to one hundred and five and one-half. After which the temperature dropped to normal and stayed so until discharged from the hospital. His weight was seven pounds, and three-fourth ounces and he was apparently in good condition. During observation, both twins seem to be doing nicely at the present time. No cultures were taken from ear at time of operation.

Cultures are invaluable and should be taken on all operative cases. It would be interesting to note if this twin showed the same bacterial organism as the brother.

J. M .- This child was the second of twins born after a hard labor during which he suffered from a fracture of the left humerus and clavicle. In the next two weeks the child either regurgitated or vomited after practically every breast feeding. The vomiting was non-projectile and usually occurred immediately after nursing.

Child was admitted to the Post Graduate Hospital at the age of twenty-nine days with the chief complaint of vomiting. The bowels were not functioning properly. vomiting. The stools being less in frequency than usual for a child at that age. He was admitted to the hospital on the tenth day of February, 1928, his weight at time of admission being five pounds. This fluctuated in the first three weeks between five pounds and five pounds, nine and one-half ounces. At the end of the fourth week his weight rose to six pounds, two and three-fourth ounces, and after that there was a gradual rise, although very slowly to six pounds, eleven ounces. At that time he was discharged to the clinic which kept track of his case. His progress at home was unsatisfactory and he continued to gain weight very slowly but had marked diarrhoea and did not seem anxious to eat. This condition kept up with remissions and the child was finally returned to the ear clinic under my service and I suggested a toxic focus in the mastoid.

On admission the child, now eight months old, weighed eight pounds, eight ounces which is really less than a two pound gain in two months. The child was in marantic condition, refused his bottle, had diarrhoea, consisting of greenish yellow, sour smelling curds and a temperature fluctuating between ninety-nine and one hundred and two degrees. The child was operated on under local anesthesia and both mastoids opened. Gelatinous matter found in both mastoids which later gave pure culture of staphylococcus albus. Four days after operation transfusion of one hundred and twenty cc. of blood was given. The weight picked up gradually in the first week to n'ne pounds, three ounces and at discharge he weighed

nine pounds, five and three-fourth ounces. His diarrhoea stopped. He now takes his feedings very well, and his temperature has dropped to normal. Under observation

for some time the child is gaining rapidly.

J. A.—This child was admitted to the hospital in May, 1928, and was discharged about two weeks later, following a bilateral mastoidectomy. At the first admission the child was suffering from gastro-enteritis which did not clear up under feeding regime. Discharged the thirtieth day of May and was re-admitted the fourth of June for another attack of persistent vomiting and diarrhoea. The stools were green to yellow in color, liquid in consistency and had a sour pungent odor. On account of the marantic condition of the child plus anemia, a transfusion of one hundred and seventy cc. of blood was The weight at time of admission was eighteen given. pounds, twelve ounces. Second day in the hospital the weight dropped two ounces and then fluctuated. Six days after admission the child died, being at the time of death, eighteen pounds and one ounce. Autopsy was refused. Temperature fluctuated between ninety-nine and one hundred and two, although it was more steady between one hundred and one and one hundred and two six days after admission, and then between one hundred and two and one hundred and four preceding death.

P. R.—Age five months, ten days. Admitted April 19th, 1928, with the complaint of fever and a non-productive cough for the last four days. At the same time there was a slight swelling in front of the right ear and anorexia was another complaint. This child was pre-

viously treated for enlarged thymus.

Physical examination: A slight swelling anterior to the right auditory meatus. The drums are both dull and slightly edematous. Tonsils are inflamed and slightly enlarged. Diminished breath sounds with occasional spots of bronchial breathing and few rales and dullness on percussion from the right middle and lower lobes.

The diagnosis on admission was: right lower and mid-

dle lobar pneumonia and bilateral O.M.P.A.

At the end of April a bilateral myringotomy was done with an escape of sero-sanguinous fluid. The temperature on admission was 103.8 which gradually receded to normal.

The weight rose from fifteen pounds, eight ounces, to fifteen pounds, ten ounces. The urine was negative. He

was discharged on the 6th of May as cured.

He was re-admitted on the 16th of May, 1928, for running ears and a slight rise of temperature in the evening. The diagnosis was: right mastoid, left O.M.P.A. and furunculosis was made. (There was a rash over the body, which had become infected, and had caused boils to appear.)

On the 17th of May, a right mastoidectomy was done and the culture returned was streptococcus hemolyticus. A left myringotomy was performed and the left ear drum later resolved. There was a gastro-intestinal upset

following the operation.

On the first of June another incision was made into the left drum and pus was obtained. A note was made by the otological consultant who said, "Will do left mastoid if pediatric service think the general condition will

stand it. Local anesthesia preferable.'

Course: Temperature was a hundred and four on the second, third and fourth days. Then it dropped to between one hundred and one hundred and one and continued so to the end of the second week. Then there was a sudden rise to one hundred and four which dropped the same day and then began a steady rise to one hundred and five on the first of June. It fluctuated between that and one hundred and two and on June 7th, the temperature rose to 107.4 following which the child died.

The weight on admission was fifteen pounds, eight ounces and dropped steadily to twelve pounds, three and

one-half ounces on the day of death.

A transfusion of 200 cc. was given on the 29th day of

Blood culture and urine negative throughout the course.

Autonsy refused

Practically ill cases of this type demand a double autrotony

M S-Age seven months eleven days Admitted May

24th 1928 complaining of ear trouble

On May 3rd the left car began to run and was asso chated with fever Both ears were opened by a private physician Drange continuous However the tem rerature has been the same. On the night prior to ad mission the temperature was a hundred and four Physical examination. Showed a well developed boy of

shout eight months old not acutely ill Both ears were running profusely but the child did not have mastoid

tenderness

The impression was

I OMPA bilateral

2 Acu e bilateral mastoiditis

A bilateral mastoidectomy was done on the 26th of May and on the right side the cortex was perforated the I to chrome mostoid

Culture returned streptococcus hemolyticus Louise Temperature Following operation it rose to one hundred and four and fluctuated until the end of the fr t weel aid then ran around a hundred until the end of the third week. Then it rose to 1048 and dropped the same day to normal and then it gradually rose to one lundred and five in the three days following when the child died

After operation there was a gradual onset of gastro enteritis and anorexia The weight on admission was twei ty pounds. This gradually dropped to sixteen pounds and it death was sixteen pounds nine ounces. The rise was evidently due to a clysis of 175 cc. just before death on June 1sta Transfusion was given on June 11th of 100 cc of whole blood. The diagnosis at death was

Gastro enteritis

Mara mu 3

Secondary anemia 4 Bilateral mastoiditis

Gastro intestinal symptoms sometimes follow mastoid operat in. There being no notation regarding the sinuses they were considered negative

### CONCLUSIONS

I—The mastoid cells begin to assume their characteristic macroscopic form about the end of the first year

2-The antrum and the associated mastoid cells should be considered as a potential source of general infection as well as an area producing symptoms from its local pathology

3-Antrotomy as an operative procedure on a child under one and one half veirs is easily done in a short time under local anesthesia The shock to the prtient is negligible. If this operation is performed when indicated cases of latent mastoiditis intra cranial complications deafness and cases where the general symptoms are due to the ear will be decreased

- The mistoid operation should be done while the indications are definite and the policy of witchful writing beyond this stage should

5—The preservation of the child's acuity of hearing should have major consideration in ill cir infections

6-The largest percentage of operated mas

toids in our series occurred during the first two years of life

7-Streptococcus Hemolyticus was the in fecting organism in 831/2%

kecent operative procedures are tending toward quick healing and good cosmetic results. This case was one where the external wound had nearly closed and the dis charge still persisted. Is it not possible that premature closure may not cause the same G 1 Syndrome that the unoperated car causes. There was no note on sinuses

A H-Age four years one month Admitted July 7th 1928 for discharging left ear, of three weeks dura tion swelling left side of neck one week Pain in the abdomen vomiting and dark urine for the past four days Thysical Examination Left car running tonsils large

red and cryptic. Pharynx slightly inflamed adenorathy of the left cervical region

The diagnosis on idmission was

1 Left mastordi is Acute tonsilitis

3 Pvelitis

4 Cystitis

Vephritis

Urine (ii admission contained many red blood cells casts albumin and pus A mastoidectom, was done three days after admission. No culture was taken

Course The temperature on admission was one hun dred and one and gradually subsided to normal until discharged. There was a slight post operative rise to one hundred and two and six tenths

The urn e cleared up gradually and was negative on the 23rd of July Patient was discharged on the 28th of July as cured

# PLASTIC REPAIR OF SEVERE RADIUM BURNS AND ANGIOMA\* By C. R. STRAATSMA, M.D., NEW YORK, N. Y.

THE surgical treatment of a case of severe radium burns following the treatment of an angioma of the face and nose is here reported.

The patient (female, age sixteen) was first seen in the Clinic June 24th, 1927, and pre-

sented the following history:

For a period of five years, between the ages of five and ten, she had been having radium applications to the left side of the face for the treatment of an extensive birthmark. During and after treatment several sloughs had formed, resulting in considerable destruction

FIGURE 1

Before Operation

Showing dense scar and angioma.

of the soft parts of the side of the face. For the last five years there have been two open lesions about the size of a half dollar, which at no time showed any tendency to heal, in spite of patient having been treated in many

leading skin clinics.

There was severe destruction of the soft parts of the left face, left upper eyelid and left side of nose. The total area involved was approximately 12 square inches. At the junction of the lateral part of nose and cheek there was an ulcerated area with destruction down to the periosteum. A considerable portion of the left ala had been destroyed. Destruction also extended down over the left half of the upper lip, producing an ectropion and an upward pull of that side of the lip. Below the outer half of the left eve was a second ulcer about the size

of a quarter. The remaining lesion consisted of dense scar and angioma, the extent of which can be seen in Fig. 1.

FIGURE 2

Inter-operation

Showing source of the flap and its final destination.

Figure 3

Pedicle severed after eight days at provimal end, which
was planted in temporal region as shown.

In considering the case two problems immediately presented themselves. (1) The excision of the ulcers and their repair, realizing that constant irritation over a period of years would tend to produce a cancerous degeneration; (2) cosmetic improvement.

A series of plastic procedures, some exten-

FIGURE 4
Showing final result of operation.

sive and others minor, were necessary to com-

plete the repair.

The work began with the excision of scar tissue and undermining the skin of the neck and sliding it up to close the defect. In this

manner the upper lip and part of the face were repaired by utilizing the skin of the neck. In pulling up the neck skin, a fold was produced in the chin below left angle of the mouth. This fold was exercised and swung up as a hinge flap and used to replace the scar tisque of the lip. The source of the flap and its final destination can be seen in Fig. 2.

This procedure replaced the skin of the upper lip and corrected the ectropion. It was impossible to slide up more neck skin because of the pull on the lower eyelid, hence another source of tissue had to be considered. inner aspect of the left arm was chosen because the texture quite nearly matched the face and it was free from hair; furthermore. it was easily accessible for a pedicled transplant. Free grafting was not deemed advisable because of the poor blood supply of the dense scar bed. The tube was made in the usual manner and ten days were allowed to elapse before transplantation. Fig. 2 shows pedicle attached to the nose. After eight days the pedicle was severed at the proximal end. which was planted in the temporal region as seen in

No work was done over a period of seven months, at the end of which time 1½ inches of the tube nearest to the nose was spread out on the face covering the area between the edge of the lower lid and the previously transplanted neck skin. Two months later the remaining tube was spread out. Fig. 4 shows the

result attained.

# IODINE AND ITS INTRA-ABDOMINAL USE IN SURGERY BY S. M. STRONG, M. D., NEW YORK, N. Y.

It is generally conceded that Iodine in the tissues of the human race is one of the necessary chemicals in our very complex physiological chemical makeup, and that a certain definite percentage of this element must be maintained in our tissues to enable us to expend a normal amount of physical and nervous energy. In emergencies, we no doubt, use a proportionate amount of our reserve supply of Iodine, depending on the severity of the emergency and time period involved.

of the emergency and time period involved.

Surgery in all forms causes more or less shock, and shock in turn is an emergency demanding a tax on our chemistry and it is fair to assume that among other things ledine is one of the body chemicals used to tide us over our emergency periods.

It will be recalled that Courtois reported in 1813 the discovery of the element to which Gay'Lussac and Davy gave the name Iodine, and he produced it by using Sulphuric Acid

on the ashes of seaweed. Todine is widely distributed through nature. The main supply is in the sea and the materials obtained from the sea. It is estimated that the seas contain something like 60.000,000,000 metric tons of Iodine. The animal kingdom, we are told, had its beginning in the sea or the wet lands by the sea, and gradually in the course of evolution we have wandered inland. Perhaps in our present so-called high state of civilization we are kept too dry and too far away from . nature's own Iodine supply. Our foods are so prepared that we, in this way also, are deprived of a source of supply of Iodine and other elements highly essential to our physical and mental fitness in these days of increased demands on our energies. Probably most of the animal kingdom and many of the species of the vegetable kingdom are dependent on Iodine as a part of their chemistry. It is interesting to note that the cocoanut trees

do best on the shores of the sea when quantities of seaweed are packed on the ground around them, whereas they do poorly when planted inland away from the sea and appear to starve for Iodine.

In animals of the sea classified as lower than the vertebrates, Iodine seems to be diffusely scattered throughout their tissues in compounds organic and inorganic, which indicates that they are a necessary part of their metabolism. Coastal regions are the richest in Iodine and the glacial region the lowest, and goiter is more common where the soil and water contain lower or non-constant amounts of Iodine.

That compound of the Thyroid gland, known as Thyroxin, contains 65% Jodine, and this compound greatly increases our metabolic rate and our physical energy. That the various cells of our organs contain chemicals in complex combinations by the thousands is known, as is the fact that Jodine is frequently a part of these combinations but there is yet, undoubtly, much to be explained and discovered. What is the relation of Jodine to cell activity? Why is Jodine scarce in one section of a cell and yet rich in another section of the same tissue?

Iodine, as we obtain it from the Pharmacist, has been, and is today one of the great benefactors of our human race. It is perhaps not always used to its best advantage, for all tissues will not accept Iodine equally well, nor will the same class of tissue in different individuals accept Iodine with equal effect. The skin blisters with the use of Iodine on one person, and the same solution is readily absorbed without injury to another. Iodine very successfully destroys bacteria on the skin when the proper solution is used, but it is not well tolerated in the eye and some other tissues.

I have used solutions of Tincture of Iodine in Intra-abdominal Surgery over a period of years with gratifying results, which, I think, are worthy of note and the further consideration of Surgeons doing abdominal surgery.

I fear that we have been inclined to use stronger solutions of Iodine on the tissues than has been necessary or desirable. Personally, in my surgical work I have learned to respect the milder solutions of Iodine. One fourth of one per cent solution for the irrigation of wounds used by Carrol-Dakin method, without any of the dangers sometimes encountered in using the Carrol-Dakin solution, and it is highly successful when used in very mild solutions as wet dressings. Also for painting the tissues about wounds, using two, three, or five per cent solutions, and painting the skin for large areas adjacent to the injury, with the

idea that the Iodine is taken up by the Lymphates and is then ready should bacteria from the wound travel that way.

The results of the bactericidal effects of Iodine is explained in an article which appeared in the Lancet February, 1915, in a letter from II. Lyon Smith, M. D. He speaks of a case of Cystitis due to B-Coli and says, "An emulsion of living B-Coli obtained from a catheter specimen of the urine was divided into six equal portions. To each portion an equal volume of solution of Tincture of Iodine in varving strengths, distilled water being the dilutent, was added thus:

	1—2% 2—1%	Ţr.	Iodine	in 	distilled.	water
••	30.5%	++	14	6	44	44
44	40.25%	**	84	**	"	44
"	5-0.125%	**	**	**	41	**
**	6-0.0625%	"	44	**	+6	"

These tubales were at once placed in an incubator at 37° for five minutes only and directly afterwards an equal volume from each was pipetted into a tube of gclose. The inoculated tubes were incubated at 37° for twenty hours and no growth occurred in any of them. The deduction was that the Tincture of Iodine solution in each of the six strengths had proved an effective bactericide." I think these results obtained by Dr. Smith merit our consideration. As a check on the above report. I asked the Laboratory of the Flushing Hospital to use the same solutions on Streptococcus Hemolyticus and the B-Coli but to incubate all for seventy-two hours. In their report to me dated July 29th, 1929, the solutions were sterile for Streptococcus in all dilutions and for the full period of seventytwo hours, but with the B-Coli, the 0.0625% solution was not sterile.

An interesting article appeared in the N. Y. Medical Journal, February, 1911, written by Major Frank T. Woodbury, Medical Corps, U. S. Army. He says: "Tincture of Iodine may be used in full strength even on the peritoneum, provided, and this is important, that the surface to which it is applied is left a dry brown, no excess being allowed to drip down and collect in pockets or crevices. It may be used in solutions of varying strengths to irrigate cavities of wounds or organs, provided the excess is flushed out with normal salt solution. This will overwhelm the germs and stimulate Phagocytosis, nature's own antiseptic." He further says:-"Daunrauther and Gollet have used Iodine solutions in the abdominal cavity, and as the writer has used pure Tincture of Iodine on the peritoneum with brilliant results, both as to immediate prompt healing and recovery and as to freedom from post-operative adhesions and obstruction." In another article by this same writer in the N. Y. Medical Journal, he said that he had never seen a case of poisoning even when he used full strength mopped on the peritoneum and the uterus. He has mopped a case of intestinal obstruction with lodine with good results.

Dr. Louis Franks likes Iodine on the skin but fears the results of letting any Iodine get into the abdomen.

Dr Sidney J. Meyer fears pure alcohol or lodine in the peritoneal cavity.

Dr. F. A. Crislet of Memphis, Tennessee, is quoted as using Tincture of Iodine 1/3 with alcohol intraperitoneally all the time and he thinks that they are saving many lives.

In the Louisville Monthly Journal, March, 1913, an article by W. C. Roberts, M.D. of Louisville, Kentucky, says in part:—"That Dr. William T. Morris thinks Iodine on the external abdominal wall may penetrate through and cause peritonitis." Dr. Frank thinks Iodine applied to abdominal wounds gets into the peritoneal wounds and causes intestinal obstruction. Dr. E. J. Johnson is quoted as pouring pure Iodine into the peritoneal cavity with good results in infected peritonitis in a large number of cases and mopping out, such cases as pus tubes, appendicitis, etc., 15 or 20 cases reported.

Thus we see differing and opposite opinions on the use of Iodine within the abdomen. From these few meager writings that I have been able to find, most of the argument seems to be based on the use of pure U. S. P. Tincture of Iodine within the abdominal cavity or to touch a highly infected spot.

For many years, and in probably two hundred laparotomies I have left a large amount of a one per cent or a half of one per cent Tincture of Iodine in water solution, warmed, in the abdominal cavity. This solution has been poured from a pitcher into the abdominal cavity after the peritoneum has been partially or nearly closed by sutures, thereby insuring a larger amount of this solution remaining within the peritoneal cavity. Frequently we have poured some of this solution over intra-abdominal tissues while we were actually at the height of our surgical procedure. I have become so pleased with my results that I have long since adopted this as a standard of my routine in clean and infected cases. In drainage cases as well as when the abdominal wall is closed at once, my results have been universally pleasing. In clean cases I think that I have given my pa-

tients the added bactericidal protection of the Iodine, and furthermore, I believe the absorbing of this mild solution gives the patient back some of the Iodine which has been expended under the stress of the operation. These patients recover from the anaesthetic in better general condition, with more nearly normal pulse rate, less exhaustion, less nausea, and more optimistic on their outlook of recovery. They show more self-confidence and determination to do for themselves, are in hed a shorter period of time, leave the hospital sooner, and in all these ways I believe the Iodine plays a marked part and I have come to rely on it, other things being equal, to make my abdominal surgery the finished product we all strive for. I have never seen a case of Iodine poisoning when my technique, as outlined, has been followed. I believe this technique of using Tincture of Iodine within the abdomen is original. In using this solution in abdominal surgery. I refer to the standard surgical procedures of which Cholocystectomy or Cholocystotomy, Appendectomy, Hysterectomy, might be good examples.

In the common infected puncture wounds of the hand and arm, for example, I have had most pleasing results by striping the arm from shoulder to finger tips with 3% or 5% Iodine solution and encasing the entire hand and arm in a light and loose gauze dressing and having this kept constantly wet with 1/4 or 1/2 per cent Iodine solution in water. That is, a drachm of Tincture of Iodine is put in two quarts of water and the dressing kept wet and cool, the balance of the body being kept warm. occasional wet dressings a drachm of Iodine to a pint of witch-hazel makes a very efficient application. With the dressings kept constantly wet with the Iodine solution in water, the skin takes on a bronze color and frequently peels, but it is not tender. It is frequently advisable to clean the skin first with green soap followed by alcohol to remove any grease or oil that may be on the skin, permitting the Iodine solution to be readily and rapidly absorbed. Such a solution, no doubt, meets bacteria within the lymphatic system and destroys them or renders them non-virulent and also stimulates Phagocytosis.

Many other examples of the use of Iodine and Iodine solutions might be recorded here, but I feel that I have sufficiently emphasized the advantage of Tincture of Iodine, and I advocate the more frequent use of the methods outlined above and the reporting of the end results obtained.

Volune 30 Number 1

### PAGET'S DISEASE OF THE NIPPLE\*

### By J FRANK FRASER, MD, NEW YORK, N Y

From the Department of Dermatology and Pathology, Cornell University, New York City

IN 1874 Paget' described a chronic affection of the skin of the hipple and areola which occurred in women between 40 and 60 and was "followed within a period of from one to two years by cancer of the mammary gland"

Paget observed 15 cases and the "majority of these had the appearance of a florid, intensely red, raw surface, very finely granular, as if nearly the whole thickness of the epidermis were removedlike the surface of a very acute eczema or that of an acute balanitis From such a surface on the whole or a greater part of the nipple and areola there was always copious yellowish clear viscid fluid exudation. The sensitions were commonly tingling, itching and burning, but the malady was never attended by disturbances of the general health. The above form of eruption was never seen to extend beyond the arcola, and only once did Paget see the condition "pass into a deeper ulceration of the skin after the manner of a rodent ulcer" "In some of the cases the eruption had presented the characteristics of an ordinary chronic eczema with minute vesications succeeded by soft, moist, yellowish scales or scales and constant viscid exudation. In others the appearance resembled psoriasis with dry, white, desquamating scales. In these forms the condition spread beyond the areola in widening circles, or with scattered blotches of redness, covering nearly the whole breast "

Paget in his original article also expressed the belief that a similar sequence of events might be observed in other situations than the breast. "I have seen," said he, "a persistent rawness of the glans penis, like a long enduring balantis, followed after more than a year's duration by cancer of the substance of the glans." "A chronic soreness or irritation on the surface of the lip often long precedes cancer in its substance."

The chinical picture described above led Paget to believe that the cruption was a form of eczenit or psoriasis, and that some of the cases were cured and not followed by any other disease. He does not, however, refer specifically to any case which ran a course followed by a cure. As a matter of fact, all the cases which he was "able to watch were eventually succeeded by scirrhous cancer." Thus we can see that the observation and interpretation of the condition given by Paget was confined to the clinical appearances of the skin condition. In other words, the disease as described by Paget was a clinical picture which he did not distinguish from other forms of dermatitis which might be followed by cancer, such as

chronic irritation of the lip or balantis or the plans pems

### Microscopic Anatomy

It is not certain who was the first to describe the microscopic changes now admitted to be peculiar to the disease. There are two striking char acteristic features in the histologic picture.

(1) The presence in the epidernus of groups of neoplastic cells, commonly known as Paget cells, which may be seen replacing and causing compression of the normal epidermal cells. A row of flattened basal cells, with dark staining nuclei, may sometimes be seen between the tumor cells and the upper edge of the corium tiple foci of tumor cells or single cells may be found in the upper layers of the rete malnight or even as high up as in the stratum corneum whence they may have been carried by the upward movement incident to the normal process of kera tinization A similar picture is frequently seen in the intraepidermal type of pigmented moles the cells of which in many respects bear a strik ing resemblance to "Paget cells" The Paget cells are readily recognized by their size, which is usually larger than that of the normal prickle cell their clear cytoplasm, absence of prickles, and hyperchromatism of the nuclei

(2) The second feature is the marked reactive inflammatory process in the corium characterized by the presence of an exudate of lymphocytes

and plasma cells

### COUMENT

It is almost universally agreed that Paget's disease as it is known today is a definite histoological entity and not a form of eczema as Paget thought. The majority of modern investigators believe that the lesion is cancer, but there are still divergent views in regard to the origin of the Paget cells. The different theories have been discussed in recent articles by Muir.<sup>2</sup> Pautrier.<sup>2</sup> Traser<sup>1</sup> and others, and therefore only brief reference will be made to them here

The theory that Paget's disease is a precancerous dermatosis, as thought by Darier<sup>6</sup> and his followers, and that "Paget cells" are the result of degenerative changes in epidermal cells (dyskeratosis) may be disearded. That they are epidermal cells which have undergone malignant transformation in situ has been held by some but vigorously contradicted by others. Masson, Pautrier and Levy have argued against this theory. Pautrier has expressed the view that the Paget cells are invading tumor cells which reach the epidermis from an underlying carcinoma by means of amoibod movements. It is well known that tumor cells are capible of such amicbeil

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York at Utica N Y June 6 1929

movements. Muir regards the Paget cells as tumor cells which arise (at least as a rule) "by neoplastic proliferation of the epithelium of the upper parts of the ducts of the nipple and thence they pass into the epidermis." Cheatle<sup>7</sup> has enun-

Figure 1
Paget's disease, showing duct-like formation growing
down from the epidermis.

ciated what he considers amounts almost to a law, namely, "that carcinoma arising in the breast below a line drawn parallel with the top of the nipple and immediately below the expansions of the outlets of the mammary ducts does not induce Paget's disease." It may be noted that the difference between Cheatle's view and that of Muir and Pautrier is that the carcinomatous transformation is primarily in the epidermis and upper part of the ducts and that the

FIGURE 2

Early scirrhus cancer showing typical "duct cancer" in terminal ducts and scirrhus type replacing the lobules.

Attrophical non-neoplastic lobules middle, right.

associated cancer is not a metastasis but a primary tumor induced by the same causative agent that causes the epidermal lesion.

In a recent lecture by Alexander Frasers on the pathogenesis of skin tumors, before the dermatological section of the New York Academy of Medicine, he advanced the view that the Paget cells arose from groups of epidermal cells which he classified according to their special functions. According to this view the epidermis in the region of the nipple is composed of several functionally listinct groups of cells. One of these groups has he function of mechanical protection which is

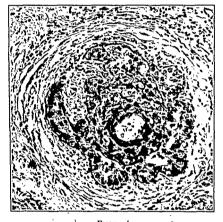

Figure 3

Clinical duct cancer with Paget's disease showing infiltration in scirrhus formation at lower end.

exhibited by the tendency of the cells to differentiate directly into corneus epithelium. From this group arises the ordinary squamous cell epitheliomas. A second group, the cells of which are normally indistinguishable from the others, belongs to those cells which embryologically grow downwards to produce the mammary ducts and gland. Although these cells in their normal state show no morphological difference from the other epidermal cells, when subjected to a neoplastic stimulus, they show the tendency to differentiate not into corneus epithelium, but into transitional duct epithelium and sometimes when

the differentiation is complete into cylindrical cells. From these cells originate Paget's disease and it is this cycle of differentiation which marks off the so-called Paget cells from the rest of the epidermis. The extent of involvement varies in different cases, but it is usually limited to those portions of the ducts above the sinuses. Carcinomatous involvement is determined by the functional system of cells and not by morphological continuity. When the mid-portion of the ducts, which presumably has a somewhat different function, is involved, we have the picture of ordinary duct carcinoma. When the intralobular end of the duct is involved, the picture is that of com-

Duct cancer showing compression of non-neoplastic prickle cells in centre.

mon scirrhous cancer (Fig. 2). The frequency of involvement is well marked from within outwards; the scirrhous or intralobular form being by far the most common, the mid-portion next, and the intraepidermal (Paget's disease) the larest of all.

### EXTRA MAMMARY PAGET'S DISEASE

About thirty-five cases of Paget's disease of the nipple occurring on other situations than the nipple have been reported. The majority of these, as I pointed out in a previous article, were examples of mistaken diagnoses. The others in all probability were sweat duct cancers. The most recent cases of so-called extra mammary Paget's disease of the nipple have been one reported by Drake and Whitfield—"Paget's disease of the vulva"—and a case of Paget's disease of the glans penis, by Susman. Whitfield refuses to accept the view that Paget's disease is an intracpithelial tumor originating from ducts, notwithstanding the fact that his description and figures clearly point to a cancer arising from sweat ducts. From the figures in Susman's case, one is impressed with their resemblance to a basal carcinoma of the adenoid type. The origin of the lesion in Susman's case was apparently from the preputial glands.

Neoplastic proliferation of the epidermal endings of sweat ducts gives a similar histologic picture (Paget cells) and may be interpreted on the same theory as that given above for Paget's disease of the nipple, the difference being that in one instance we are dealing with sweat ducts and in the other with mammary ducts. The marked similarity between the two may be explained by the fact that embryologically the mammary gland is developed through a special differentiation of sweat ducts.

# Summary

(1). Paget's disease of the nipple is a mild grade of corcinoma of the intraepidermal portion of the mammary duct.

(2). For an indefinite period, sometimes extending a few years, the lesion may remain intraepidermal but later on breaks through its epidermal confines and becomes an infiltrating and metastasising carcinoma of the breast.

(3). Paget's disease being essentially a carcinoma, the minimum rational treatment is mas-

tectoniy

movements. Muir regards the Paget cells as tumor cells which arise (at least as a rule) "by neoplastic proliferation of the epithelium of the upper parts of the ducts of the nipple and thence they pass into the epidermis." Cheatle has enun-

FIGURE 1

Paget's disease, showing duct-like formation, arosying down from years for the passage of legislation to terminate the intolerable conditions which existed. Finally the State took action and legislation was effected which provided for the establishment of a State Lunatic Asylum at Utica. This asylum was opened in 1843, and was to provide for the transfer of the most curable cases from County almshouses. The main building of the present Utica State Hospital, with its Greek portico, is the original structure.

In 1848 a law was passed providing for the transfer of insane persons in State and County

prisons to the Utica State Hospital.

In New York City the insane had so increased in number that special buildings were erected to accommodate them. At first they were taken care of in the almshouse at Bellevue Hospital, but in 1839 a new asylum was opened on Blackwell's Island, the first county asylum to be erected in the State. Later, in 1871, another city institution was opened on Ward's Island.

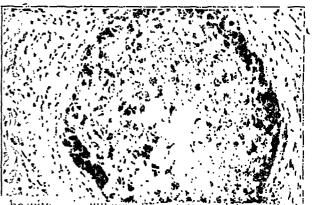

Brooklyn, then a separate city, opened the Flatbush Asylum in 1852. Monroe County, in 1863, was authorized to build a county asylum for its insane at Rochester. The New York, Brooklyn and Rochester Asylums eventually became State

Hospitals.

In 1858 a law was passed to establish an asylum for the criminal insane at Auburn Prison, for the care of insane convicts, and the Matteawan institution for the care of those becoming insane while under indictment for a criminal offense, was opened in 1892.

associated cancer is not a metastasis but a primary tumor induced by the same causative agent that causes the epidermal lesion.

In a recent lecture by Alexander Fraser<sup>8</sup> on the pathogenesis of skin tumors, before the dermatological section of the New York Academy of Medicine, he advanced the view that the Paget cells arose from groups of epidermal cells which he classified according to their special functions. According to this view the epidermis in the region of the nipple is composed of several functionally listinct groups of cells. One of these groups has he function of mechanical protection which is

Department of Mental Hygiene was created in 1927. This Department now has supervision of the State Hospitals, State Schools for the Feeble-

minded and the Epileptic.

As may be expected, the treatment of the insane in the old days was chiefly custodial. Mechanical restraint (now abolished in the form of locked leather gloves, locked cuffs and canvas suits, with the arms of the patient tied behind his back, were in vogue for disturbed patients. The Utica crib, a slatted contrivance placed over the patient's bed, permitting the patient only to sit up, was in use for excited patients. So-called "chemical restraint" in the form of combinations of large doses of chloral, bromides and hyoscyamus, ("the black bottle") were in common use for controlling the troublesome and maniacal patients. In more severe excitements, hyoscin hypodermatically was administered. The patients in the wards for disturbed and untidy cases, were seated in strong arm chairs or benches screwed to the floor. Strong rooms for isolating the destructive and unruly patients were in common use. The nursing care was of a meager order. There were no trained nurses or attendants. The ward force was paid a mere pittance; physicians were few and ill paid.

Farm activities for the able-bodied, ward work, care of grounds and employment in the various hospital industries, were the chief activities available for patients. In some of the more progressive institutions various forms of amusements and recreations were organized. Patients who recovered or who showed marked improvement.

<sup>\*</sup> Read at the Annual Meeting of the Medical Society of the State of New York, at Utica, N. Y., June 5, 1929

were discharged or paroled for a short period, but there was no after care whatsoever, until the second decade of our century. Mental and physical examinations were of a meager nature and written in long hand. A few rubber stumps with stereotyped wordings might have well been employed to take the place of the continued notes. Today a stenographer is provided for each ward service, thus assuring more comprehensive case history notes. The medical staffs' conception of mental disorders was rudimentary and the medical interests of the physicians were chiefly directed toward the physical aspects of their patients.

However, in the course of time progress was made Schools of nursing for the training of nurses and attendants were mangurated A Psychiatric Institute was established, and under the stimulating influence of Dr Adolf Meyer, a uniform system of anymnescs taking and mental and physical examination was developed throughout the entire State Hospital system. He arranged for courses of instruction for the more interested physicians from the various hospitals, used his influence to establish clinical and pathological laboratories in each hospital urged the securing of autopsy material for study, held clinical conferences at the various institutions in order to stimulate the interest of the medical staff and en courage them in the direction of scientific research

The Instanta Law, or as it is now termed, the 'Mental Hygiene I aw, has in the course of years been amended from time to time, in the direction of eliminating the legal aspects of commitment and making it more of a medical procedure. In this was entrance to the hospital is freinitated and while formerly the relatives of patients looked upon commitment as a last resort, we now receive many voluntary cases who can leave after giving ten day' notice, also cases on physicians' certificates, and temporary commitments for thirty days' observation, on the local health officer's certificate.

We have been handicapped in our treatment of patients by shortage of physicians, the constant turnover of both doctors and nursing personnel and by the overcrowding. It takes about two years to train a physici in in the art of making mental and physical examinations spends much time and money in this training, only to have them leave to seek more desirable fields of endeavor where opportunities for fin uicial ad i incement are more promising. A permanent in terested medical staff is the key tone of all recon structive effort. If it cannot be had our best intentions are frustrated to a greater or less extent The overcrowding is a serious problem and a bandicap in practically all of our hospitals. It is had enough to crowd a lot of normal people together in the same day rooms dining-rooms and dormitories twenty-four hours of the day, but think of the results of crowding an excessive number of mentally sick patients together for weeks, months or years. This condition bringabout irritation, personal conflicts and retards recoveries and improvements. The mentally sick for the most part are human like the rest of us, and react to an unfavorable environment like normal persons. On March 31, 1929, there were 45,145 patients in the State hospitals, an excess beyond their certified capacity of 30.8%. In many, the overcrowding is 40%. This tremen dous excess is not only present in the metropolitan district, but also in the up-state hospitals, who are compelled to receive transfers of patients from the metropolitan district.

The great minority of our patients are not of the disturbed type, although the casual visitor to our hospitals generally asks to be taken where the 'wild ones' are. The conception of the average citizen is that the insane are individuals who

run around like raving manuacs

Medical care and treatment of our patients has been vastly improved in recent years. Among the outstanding features are the following. Erection of modern reception buildings in many of our hospitals. These provide for improved classification, segregation and treatment of incoming patients.

The use of restraint is now limited to the protiction sheet and canvas camisole. Wet packs are used only as a therapeutic measure not as re-

straint Dry packs are prohibited

Increased facilities for hydrotherapy. Continuous baths of water at body temperature are extensively used for disturbed patients. Hypnotics have been reduced to a minimum. Seclusion in a room the door of which the patient cannot himself or herself open, is limited to three hours and the patient is visited every hour.

Better provision for the care of surgical medical and infirmary cases. The new State Hospital now being erected in Rockland County will have a separate well planned medical and surgical hospital for patients and employees.

Development of clinical laboratories under the charge of a full time pathologist, assisted by trained technicians. We are experiencing difficulty of late in securing pathologists on account of the low salary paid them.

The establishment of dignostic clinics in many of our hospitals. These have facilities for eye, cir, nose and throat examinations, medical, surgical and gynecological, and other specialty examination rooms, dental units with full time resident dentists and dental hygienists, psychological examination rooms 1-ray units, physio therapy and basal metabolism apparatus, nursing and stenographic service, a staff of competent visiting and consulting specialists who make scheduled visits to the hospital

Modern operating rooms

Fully equipped examining rooms on each ward

# ANATOMY

How the uterus is supported, and the mechanism for production of prolapse, has given rise to two distinct schools, a proper appreciation of which necessitates some anatomical exposition.

In dissecting a female pelvis from within, when the peritoneum is removed, one can easily determine the presence of a mixture of connective, areolar, and smooth muscle tissues which radiates to all parts of the bony pelvis, with the cervicouterine junction as a center. The lateral or parametrial parts (cardinal ligaments-Koch's transverse ligaments) extend to the sides of the pelvis. The posterior or sacro-uterine portion extends to the sacro-iliac synchondroses, and are the lateral boundaries of the cul-de-sac of Douglas. teriorly, a thinner layer is fixed to the spmphysis and is designated as the pubo-cervical ligament. That this is the main support of the uterus is the undoubted belief of E. Martin, Fothergill, and a host of other workers. Halban and Tandler,1 whose epoch-making research has firmly established the anatomy of the female pelvis, are just as convinced that the levator ani muscles, its fascias, and the triangular ligament (together the so-called "pelvic sling"), are the sole supports of the uterus and injury to these structures is the etiology for prolapse.

The levator ani muscles are attached to the rami pubis, anteriorly; and to the arcus tendineus and obturator fasciae, laterally. They encircle the urethra, vagina, some fibers blend with the anterior rectal wall (pubo-rectal fibers), other fibers join the corresponding ones from opposite side, join the coccygcus muscle and thus close the pelvis posteriorly. Anteriorly, however, there is a gap between these muscles (levator gap), which is covered by the triangular ligament made up of the deep transverse perineii muscles and covered with two layers of firm fascia. The urethra and vagina pierce this ligament and are covered along their course with some of its fascia (fascia propria). This "hiatus genitalis" is the

Thus, briefly, the pelvic organs are contained in (A) an elastic connective tissue which permits of mobility in response to pressure, and (B) a muscular plate whose entire function is to pull the urethral, vaginal and rectal orifices anteriorly.

weak point in the entire pelvic sling.

# ETIOLOGY

The causes, therefore, in multipara are:

I. Parturient.

(a) Subinvolution, and

(b) Laceration which causes a lengthening of the "sling," and therefore the vaginal and rectal openings sink backwards, and the pressure formerly exerted on the pelvic muscles, is now exerted on these openings.

Fitzgibbon,4 however, contends and proves that laceration of the pelvic floor cannot and does

not produce prolapse, but only produces rectocele, which can be relieved by perineorrhaphy. On the other hand, he cites cases of prolapse, in which the perineum is intact, and his lelief is that prolapse is caused by injury to the cadopelvic or levator fascia, in front of the cervix and in the lateral fornices.

II. The type of woman, as described by Stiller (Culbertson<sup>11</sup>), thin, long-waisted and undernourished is subject not only to prolapse, but to other evidence of poor muscular development, as varicosities, and visceroptosis.

III. A definite relationship between prolapsus uteri and spina bifida, in multipara, has been noted by Ebeler and Dunker.<sup>2</sup> They have roentgenrayed twenty-eight multipara with prolapse and found twenty-five cases of spina bifida occulta. They took another series of twenty-eight women, without prolapse, and found only three cases of spina bifida occulta on roentgen examination. Here the causative factor seems to be a neurotrophic disturbance in the fourth sacral nerve supplying the pelvic muscles.

IV. Ascites and large tumors may cause prolapse, but with the removal of its cause, the uterus often assumes its normal position.

In a review of the literature of prolapsus uteri, one is impressed with the large number of cases of prolapse in the adult nullipara and in the newborn. Munro, in 1735,3 reported the first known case in a girl of three years of age. Shaeffer<sup>a</sup> reported a case in a fetus in the second half of intrauterine development. However, the etiology in the newborn is fairly well known, in that 86%of these cases are associated with spina bifida. In the adult, nullipara, where the prolapse develops later in life and with no spina bifida to account for it, Findley believes this to be a stigma of infantalism, and cites the accompanying sterility as evidence. Up to 1917, there have been reported 153 cases of prolapse in newborn and in adult nullipara, and I have been unable to find any new cases since then.

# TREATMENT

Before considering the operative relief of prolapse, it is advisable to stress the importance of prophylactic treatment of this condition. Masson<sup>25</sup> is certainly justified when he states that "Many of the radical operations for marked degrees of uterine prolapse, cystocele and rectocele in women who have passed the menopause, could be avoided by proper management and minor operations earlier in life. The majority of women applying for treatment for procidentia date their troubles from their first confinement. Failure on the part of the general practitioner or obstetrician to recognize and adequately treat subinvolution, pelvic infection, and lacerations of the cervix and perineum is responsible for the amount of radical treatment later."

Full bladder, full rectum, prolonged labors, and submucous tears, are held responsible for subse-

quent prolapse

It is noteworthy that episiotomy, long held in contempt, is being practiced as a prophylictic measure against prolapse Cron" states that in 53% of his normal cases and 63% of his opera tive deliveries (per vagina) he resorted to this method of preventing separation of muscles and fascia, in prolonged labors Post partium examination in his cases revealed perfect restoration of the pelvic floor, almost nulliparous in character

At the Brownsville and East New York Hospital, episiotomy is performed almost routinely on primipara, in normal spontaneous deliveries In verbal communications from the six leading obstetricians the post partum healing of these wounds is by primary intention, and the pelvic floor is antiomically and physiologically intact

Observations ten years later, on these cases, will record how effective episiotomy is in prevent

ing prolapse of the uterus

When a patient seeks surgical relief for prolapse of the uterus, the gynecologist is confronted with a very difficult and perplexing prob lem 1e, the type of operation to do in order to obtain the best results. There are at present many distinct types of operations, and one must be skilled to apply the proper method to a par-The age, social status, general ticular case health, provision for future pregnancy, condition of uterus, and the preference of the patient all have a bearing on the choice of the operation and the probability of cure

The commonest types of operations are con-

sidered below

### 

1 Vaginal operations

a Anterior colporrhaphy

b Rawl's operation

Cothergill operation

2 Abdominal operations

n Webster-Baldy

b Olshrusen and modifications

Luture pregnancy eliminated

a Interposition operation

b Kieland operation

( Hysterectomy

1 Vagınal

2 Abdominal

d Sims Limmet-Baldwin

e I c Forte operation—complete clos ure of vigini

I do not intend to describe the technic in all these operations, except in those types that are not well known and that I have been able to glean from recent literature. The Rawl's technic and auterior Colporrhaphy are only feasible in cases of moderate cystocele, associated with first degree prolapse and is mentioned only in connection

The Fothergill method of cure as adopted by the Manchester School as based upon the belief that the connective tissue is the main support of the uterus. The incision, is for an anterior colporrhaphy, is carried well laterally around the cervix and the vaginal mucosa denuded so well to expose the parametrical tissue. This is sutured in front of the cervix and acts as a shelf to sup port it In a report of 156 cases, 150 are reported as cured with only six failures

F H Lacey reports 450 cases, who have had the same operation-cases that have been fol

lowed for two and one half years

Agc	Cases	Cures 9
Under 20	1	100%
21-30	75	87%
3140	200	89%
4150	108	95%
5160	47	89%
61—70	21	87%
71	1	100%

Graves16 in discussion of his experiences with types of operations finds the Webster Baldy distinctly unsatisfactory and condemns it as not based on sound principles For prolapse, how ever. Graves finds the Obship sen operation al most ideal and reports its use in about 690 cases with very satisfactory results

An extensive review of the literature impresses one that the operation of subvesical interposition of the uterus, as developed by Watkins, Wertheim and Shruta is hie ideal on , un

der the proper circumstances

Johnson<sup>16</sup> in 68 cases—operated on between 1909 and 1919-reports 54 cured with no imme diate operative mortality Again in 1923, in fifty cases operated on since 1919, he reports 32 replies to his letters of inquiry with 27 cases wholly cured (90%), two partially cured and three failures

Grad,17 Phaneuf18 and Brady21 report very satisfactory results with the interposition opera

tion giving results as high as 90% cures

Out of 23 interposition operations Grad17 re ports 19 successful, 2 partial success and 2 fail

Phaneouf reports only 3 fulures in a series of 63 cases observed over a period of seven years

Brady's statistics are still better, that of 48 cases-45 obtained excellent results, 2 are im proved and only one failure

In a very recent article, Crossen-2 sums up. very briefly and aptly, the case for the interposi tion operation as follows

(1) The uterus is used to close the weakest spot in the pelvis

(b) Operative traum i and time are reduced to i minimum-very necessary when one considers that this operation is performed most often on elderly women, whose general vitality is reduced.

(c) Subsequent marital relations are not interfered with.

However, the main criticisms that one finds against this operation are:

- 1. It only relieves cystocele, using the uterus to space the gap in the pelvic floor.
  - 2. There is no definite support for the cervix.
- 3. It necessitates sterilization—which is highly disadvantageous in child-bearing women.
- 4. Many have severe bladder symptoms for long periods post operative.

Bullard<sup>24</sup> in an analysis of the treatment for prolapsus uteri at the Woman's Hospital, New York City, gives the following figures:

while all the others are relegated to a historical past.

R. T. Frank<sup>1</sup> decries the multiplicity of operations, their apparent lack of proper anatomical attack and offers his experience and technique, based upon a proper anatomical basis. However, he offers no definite statistics as to length of cure, age, incidence and operative mortality and a proper evaluation of his procedure is as yet impossible.

It is well to remember that practically no case of prolapse can be properly treated unless a posterior colporrhaphy or perineorrhaphy is done in addition to whatever other procedure is undertaken.

In conclusion, my impression, from a review of the literature, is that the proper anatomical and pathological factors of prolapse are being understood now better than ever, and the number of operations used in the cure are being rapidly reduced. Only those operations, which are based on sound anatomical and physiological principles are being used, with better results.

# ERMOTHERAL in a safe, convenient form!

continuous heat and mechanical support provided by an Antiphlogistine dressing are decided beneficial in many affections of the respiratory tract so plant during the winter months.

In Icute Tonsillitis, Pharyngitis and Laryngitis and — all those respiratory conditions calling for the application and maintenance of continuous moist heat, Anti-hlogistine is the local adjuvant par excellence.

Applied to the neck, Antiphlogistine helps to relieve the local discomfort and may do much to obviate the onset

# In Acute Bronchitis

Antiphlogistine is generally applied as hot as can be comfortably borne to the entire front, as well as the back, of the thorax and covered by oil silk or rubber sheeting so as to retain the heat. Thirty-five years of clinical use show that

# Antiphlogistine

by Kaintaining a uniform degree of heat for over twelve deration usctivates the circulation, induces diaphoresis and hours, annuale pain and discomfort associated with this disease

# POSTOPERATIVE COMPLAINTS AND VISCEROPTOSIS

### By WILLIAM L CORCORAN, MD, NEW YORK N Y

THE causative factors producing symptoms in the lower abdominal region are legion. This is true for male and female individuals, but especially true of the latter.

It is my purpose to emphysize one predisposing factor, one indirect cause of annoying conditions that bring to mught treatment of a medical, topical or surgical inture, even though such treatment my be considered of great or specific value under other and uncomplicated circumstances. This particular factor is visceroptosis.

Constipation, gaseous eructations, regurgitation, flatus, tenesmus, micturia, localized distress, pan of all types (slight, moderate, severe colicky, rheumatic, neuritic leading to the hip joints, to the sacrollacs or to the symphysis), bad taste, fetid breath, amenorrhea, menorrhagia, dysmenorrhea, vaginal discharge, pruritis, hemorrhoidal fluctuations, anal fissures, vertigo, tinnitus aura, disturbances of vision, fatigue, backache head ache, and finally persistent postoperative uneasiness are bitterly complained of and the stubbornness of those symptoms to relieving measures may often suggest the presence of a neurosis

The underlying condition of visceroptosis itself responds beautifully to corrective measures, yet, owing to the veiled condition of affairs, those corrective measures are unfortunately often not in Were they initiated then the removal of the indirect ptotic influence upon a persistent residue of symptoms would bring gratifying results for unaccounted manifestations that emanate from the female pelvis, and at times from the lower male abdomen Prior to the performance of an abdominal operation, ordinary ptosis and ptotic symptoms may have been present together with the acute symptoms and signs due to a sur gical abdomen Even so, the immediate postoperative career may have been free from annoy ances of the direct type because of the beneficial results due to the surgical removal of an irritating influence, to postoperative diet, to catharsis, to rest in bed, etc However, when, according to followup clinic-fashion patients present themselves three months, six months or one year after operation, how often do we not hear the complaint of some or all of the direct symptoms, even though the surgical fault has been corrected and removed from consideration as a causative fac tor For example, after a retrocecal or chronically inflamed type of appendix has been removed, and the pain around the iliac crest, or in the hip joint, or in the sheral region either retuins or threatens its recurrence, then it behooves the operator to formulate a good clear reason for such a miship. Let us consider backache, panis in the limbs, menstrual disorders, micturia, and sterility, when due to much inical displacements of

Local applications to an infected or the uterus hecrated cervix along with the insertion of a correct pessary, are known to give relief in a certain percentage of cases This relief may be tem porary or may be perminent or may be used to advantage in a diagnostic way prior to surgical The measures may be adapted to the measures cervical pathology or to surgical adjustment of a malposition, all of which brings about relief in a percentage of cases, but there yet remains an other percentage which fails to yield expected results from topical applications, pessary or surgicil correction, or the good result may be of such a temporary nature that a tendency appears to condemn all topical and surgical procedures. No matter how valuable they may be, they hardly seem worth while, in view of the actual result

Fo my personal satisfaction I repeatedly find the concelled ptotic influence of great importance in a large group of the remaining deficient percentage, so much so, that I have mangurated in my survey of cases special attention to the follow-

1—Along with a history of major abdominal and pelvic complaints, a careful recording and consideration of symptoms will frequently evince

a hidden ptotic tendency

2—Low blood pressure without evident circulatory disturbance, along with slight impairment of the blood characteristics

3—The presence of a small amount of albumin

or of indican

4—The notation of the asthenic state, the presence of a pendulous abdomen, lordosis, scoliosis, impoverished nutrition

5-Palpation, when abdominal structure per-

nuts, of the impacted colon

6—Skiagraphic examination in the erect posture of the gastrointestinal tract by means of a barum series, thereby, making a specific record of the draphragramatic outlines, air space, and the prescue of gas anywhere throughout the tract, the pressage of the ingested barum in transit to the stomach, its reception and distribution upon reaching the stomach, the position and outline of the latter, its emptying time, retention if any, the location of the small bowel, the eccum, ascending, transverse and descending colon and rectum

In the ptotic influence of the outright asthenic, we find a complete downward displacement of the entire or greater portion of the tract, but on repeated examination of cases where I find the indirect ptotic influence so important, this is not increasingly the case. Trequently the storach will be high fixed, the small intestinal flurry found in situ and the eccuin, ascending colon, hepatic themse and a goodly portion of the transverse colon ptosed completely on the floor of the right

pelvis with the remaining transverse colon, making an abrupt ascent to reach a normally fixed splenic flexure or the opposite position of the flexures may be present. At times, both flexures may be more or less within normal sites with a suspension of the transverse colon between, extending well down into the pelvis. Again the redundant The various positions · colon may be present. which the gastrointestinal tract may assume, can only be specifically recorded by skiagraphic examination. Any one or all dislocations may be present with surgical conditions in the abdomen and pelvis, and not obvious at the time of operation for the removal of an appendix, tube, ovary, uterus, or for replacement of the pelvic viscera. It is here our indirect influence may give rise to immediate or delayed postoperative annoyances.

The treatment of direct influencing type or ptosis depends largely on correction of specific

faults.

1—Diet. The ingestion of plenty of water, the taking of regular and small feedings at first,

gradually increasing the volume.

2—Medication of specified type. Administration of Acidum Hydrochloricum Dilutum if an achylia, or the ingestion of alkalis if a hyper chlorhydria; neither, if the total and free hydrochloric acid is normal. Digestive ferments in a vehicle for tonic medication, with strychnina if the therapeutic indications are present; with sedatives, the best of all Sodii Bromidum if its use will be an advanttge. Mineral oil for lubrication both per os and rectum. Glandular therapy if indicated.

3—Colonic irrigations in restricted numbers if

costiveness, flatus and mucus are present.

4—Exercise. Walking, short distance at first. Setting up and body bending procedures. The knee chest position. In the female this position to be assumed with vulva open for entrance of air so that the atmospheric pressure will carry

womb upwards.

5—Supportive measures. Supporting measures are the most important influences in correction, but the prescribed supportive corset or belt with its pads must be designed and constructed to remedy the actual to the toroid upon x-ray examination. At the correct is put on the corsetiere must give a matrictions for its wear-

In porting times which must be followed are  $n_{e,w}$ 

(a) The caset must first be adjusted while he patient is lying down. The lower edge of the corset and the attached pads must be at of upper portion of symphysis pubis, a uppermost part of corset or belt pulled tight, but must be worn y snug so the uplift will not

(b) The corset or belt must be removed only during periods when patient is lying down.

6—The occurrence of pregnacy may be considered a definite help, but the above outline of treatment must be inaugurated postpartum.

Now the indirect influencing type of treatment can be handled by bearing in mind such possibilities as minor symptoms in the syndrome, recognizing the mentioned possible factors that may be observed on physical examination, laboratory suggestion, and an x-ray survey of the gastrointestinal tract. For the successful treatment of the direct type it is quite necessary to handle these cases systematically as outlined. In the indirect influencing type where symptoms are not only annoying, but numerous, such detailed treatment is not always necessary. By correcting the local, mechanical, or surgical outstanding cause of trouble the major step is accomplished, but this correction must not be handicapped from producing its expected results. At times a complete state of ptosis may be present with outstanding symptoms of local, mechanical, or surgical conditions. Here a systematic detailed correction must be made in conjunction with other procedures. Again the uterine displacement, diseased ovary, tube and appendix may be corrected surgically without any of the many immediate or delayed complaints, if correction of ptosis is incorporated in the after treatment.

When the ptotic pressure from above is removed, the topical treatment of the locally diseased cervix, and the early use of the pessary alone or with the associated dilatation and curettage when indicated, will often give symptom-free results.

The following cases typify some of the surgical conditions which may be complicated by visceroptosis.

# REPORT OF CASES

Case 1-Miss K.R., age 54, was admitted to the Knickerbocker Hospital, October 4th, 1924. complaining of stomach symptoms intermittently for the last twenty years. The last attack, the onset of which was three weeks ago has been very severe and persistent, a heavy feeling being present in epigastrium with a diffuse pain throughout abdomen occurring two to three hours p.c. and relieved by hot drinks. A physical examination revealed the abdomen to be scafoid in type with a palpable abdominal aorta and a tender mass in left upper quadrant. The working diagnosis-Duodenal ulcer with possible malignancy. X-ray findings-Stomach large, fish-hook type, located in median line. Between middle and upper part of corpus there is a defect in its filling. part of stomach is characterized by an irregular contoured channel. Location of alteration is at level of arcus costae. Five hour picture shows no retention. Skiagraphic findings indicate carcinoma of the corpus ventriculus. Diagnosis on discharge-Carcinonia of stomach, condition in-

operable.

This case was referred to me October 10th. 1924, with the above hospital survey. History and physical examination identical with that above. Positive urinary findings, s.g. 1.010, albumin ft. trace, indicanuria. Blood examination Gastric extraction after and count negative. test meal showed definite achylia.

After a course of tincture of belladona up to the point of tolerance, a gastrointestinal x-ray series was taken in both the prone and erect position. Gastrointestinal findings-Upright:-Long atonic drawn-out stomach, syphon form. Lowermost pole resting on the floor of the pelvis. Prone:—Stomach over a hand breadth below the crests, atonic, tense, in central portion it shows a condition similar to the hour glass contraction. This is noticed on all plates in the prone position. No other defects in the stomach outline. hour glass appearance is evidently nothing more than an apposition of the stomach walls at that position due to an elongated stomach. Duodenal cap fairly well filled out and seems to show itself persistently. Six hour picture-Stomach empty, barium in lowermost portions of the ileum and some in the ascending colon. Twenty-four hour picture-Barium in ascending and proximal portions of the transverse which portions of the colon are definitely looped and ptosed into the pelvis. Forty-eight hour picture-Most of the barium is in the distal portion of the transverse colon and some in the descending colon. Diagnosis-Profound visceroptosis.

The following routine was inaugurated:

1—Visceroptotic diet.

2—Elimination of the colon contents by irrigations and mineral oil.

3—Medication—Acidum Hydrochloricum Dilutum with meals.

4-Abdominal support designed according to

In six weeks patient was symptom free and has continued so ever since, weight increasing forty pounds. Patient was last seen July 16th, 1928. Had no complaints whatsoever.

Case 2-Mrs. P. B., age 34, was admitted to the Knickerbocker Hospital, January 28th, 1926, complaining of pain throughout abdomen, gaseous eructations, nausea, vomiting, constipation, persistent vaginal discharge, backache, headache, vertigo, fatigue, and painful enlargement on right labia. A physical examination revealed the abdomen to be distended and rigid. No visible pulsations. Tenderness marked over both lower quad-Vaginal examination—Cystic enlargement on right labia, cervix normal, tender palpable masses present on both sides. Rectal examination -Tender masses palpable, within both lower

quadrants. Urinary findings normal. Blood examination and count normal. Working diagnosis -Bilateral salpingitis and oophoritis, Bartholin cyst. Operation-Median line incision. Appendix freed from right ovary, acutely inflamed, removed. Uterus normal in structure, size and Right ovary, cystic throughout, removed. Right tube, acutely inflamed, removed Left ovary, cystic throughout, removed. pyòsalpinx removed. Wound closed in lavers. Bartholin cyst enucleated with subsequent repair. Patient's postoperative career was uneventful, Loth wounds healing by primary union, and she was discharged February 7th, 1926, improv.d. Diagnosis on discharge-Salpingo-oophoritis, appendicitis, cyst of Bartholin gland.

For some weeks after leaving the hospital, the patient complained of backache, headache, vertigo, gaseous eructations, nausea and vomiting, and constipation which would respond only to strong purgatives. Being a well nourished individual with a fairly well developed abdominal musculature, a ptotic condition was not outrightly suspected. However, the last mentioned symptoms were not present during the immediate postopera-

tive career.

A fractional test meal gave evidence of an achylia, but during the time of operation I explored the upper quadrants and made out a normal emptying gall bladder. Subsequent urmalysis showed a one plus albumin and an indicanuria with a negative microscopic picture. These facts led to a gastrointestinal x-ray examination which revealed the following: A stomach filled out completely, located just below the level of the iliac crest, duodenal cap filled out normally. Five-hour picture-Stomach empty and a small intestinal flurry present on floor of pelvis. Twenty-four hour picture-The meal outlines a normal ascending colon and hepatic flexure and extends throughout the proximal three-quarters of the transverse colon which is supported on the floor of the pelvis. Forty-eight hour plate shows the meal in the distal quarter of the transverse colon meeting a normally placed splenic flexure and descending colon.

After the establishment of diet, medication, elimination, specific abdominal support and exercise, all mentioned symptoms have disappeared but at present and for the past six months an artificial menopause has made itself evident and is gradually being checked by glandular therapy.

Case 3-Mr. G. L., age 35, was admitted to the Knickerhocker Hospital, July 19th, 1927, complaining of pain in lower right abdomen, nausea and vomiting, and constipation. A physical examination revealed the abdomen to be rigid and slightly distended, with a tenderness present over right lower quadrant. No visible pulsations, Rectal examination-Tender palpable mass within right pelvis. Urinary findings-Marked trace of

albumin. Blood examination-White cell count 14,000. Working diagnosis—Acute appendicitis. Operation-Right rectus incision. Appendix isolated, delivered, acutely inflamed throughout, removed by carbolized knife, and mesentery tnd stump ligated. Wound repaired in layers. Postoperative caréer uneventful, wound healing by primary union, and patient was discharged July 30th, 1927, cured.

Patient was observed once per week after leaving hospital and the gradual onset of the following symptoms appeared within six weeks: pain throughout abdomen, one-half hour after the ingestion of food, gaseous eructations, backache, fatigue, and loss in weight of ten pounds since May 1st, 1927. The consideration of these symptoms, along with the urinary findings led to an x-ray of the gastrointestinal tract, which disclosed the following:—A stomach which filled out completely, normal in size and position, with a normal duodenal cap. Five-hour picture-Stomach empty, meal in small intestine. Twentyfour hour picture—Meal in ascending colon, extending upwards to level of right iliac crest. Forty-eight hour picture—The ascending colon, hepatic flexure, and proximal two-thirds of transverse colon ptosed well below the level of the right iliac crest. The remaining portion of the transverse colon ascends abruptly to meet a normally fixed splenic flexure and descending colon, the outline of the latter appearing in the seventytwo hour view.

An abdominal belt with specific padding for the existing rightsided ptosis was applied. months following application of belt combined with diet, medication, and exercise all the postoperative symptoms disappeared, the urinalysis is normal and the patient has gained fifteen pounds in weight.

Case 4—Mrs. E.C., age 31, was admitted to the Knickerbocker Hospital, May 26th, 1927, complaining of sudden onset of persistent pain in lower right abdomen, with nausea. A physical

examination revealed a moderately distended abdomen, no rigidity or visible pulsation, but a tender palpable mass within right pelvis. Urinary and rectal examinations also revealed a tender palptble mass within right pelvis. Urinary findings—Albumin trace and indicanuria. Blood examination-White cell count 7,000. Working diagnosis—Right cystic ovary. Operation—Right rectus incision, appendix isolated, and removed by ligation of mesentery and stump, severed with carbolic knife. Right ovary, cystic, clamped at stump, severed, and stump and vessel ligated. Uterus, tubes and left ovary normal. repaired in layers. Postoperative career uneventful, wound healing by primary union. discharged, cured.

Two months later patient complained of backache, epigastric quivering, gaseous eructations, headache and fatigue. A gastrointestinal series disclosed the following:—A long atonic, syphonform of stomach, lowermost pole on floor of pelvis with a normal duodenal cap. Six-hour picture—Stomach empty, barium in lowermost portion of ileum and in ascending colon. Twentyfour hour picture—Barium in ascending colon, location below level of right iliac crest and in transverse colon which is definitely ptosed on floor of pelvis. Forty-eight hour picture—Transverse colon outline remains distinct and the splenic flexure is shown well below level of left iliac crest, the column continuing in the descending colon.

A fractional test meal revealed the presence of an achylia.

All symptoms were rapidly relieved by diet, elimination, medication, and abdominal support.

### NINETEEN HUNDRED AND THIRTY

The new calendar year finds the Medical Society of the State of New York and its constituent county societies in the midst of their most active season. A year-book of record has closed and a new volume has begun, but the continuity of the work of the Society goes on.

Ten thousand or more members of the State Society will doubtless make a New Year resolution to preserve their Journals. Our editorial suggestion is that they begin with the Journal of December fifteenth, 1929, for that number contains an index of medical society activities which will continue during the present year. The editors frequently have requests for information as to where records of certain activities may be found. The yearly index will help inquirers to answer many of these questions directly for themselves. Possibly too, the index will be a revelation of the wealth of the material in the Tournal.

#### COST ACCOUNTING IN MEDICAL PRACTICE

By reason of the shafts being levelled at the medical profession in general, and at individual physicians, from all angles, in popular magazines, your President would urge that the individual doctor adopt a system of bookkeeping for the coming year from which en masse, the pubic in New York State, or in any given community, may be informed by organized medicine just how much it costs the individual doctor to give attention to each person per call in his office during the coming year of 1930; just how much it costs per house call on the average, for the year; and just how much charity work per day, at the regular fees the doctor has given to the community.

This can all be done by adopting a real system of bookkeeping, such as the successful merchant is now compelled to keep, if he would know his standing financially at the end of the year.

It is now the question of overhead expenses, by the reduction of which the merchant hopes to have more for himself at the end of the year. And by the same token the doctor should learn to disassociate his income from medical practice, from his income from invested savings (if he has any), and so learn if he is unconsciously taking from his savings to help support his professional practice.

In the offing, as one travels about the State, one realizes that doctors are poor business men, and pay little heed to the *outgo* of their money, but are eager to learn how they may increase their income.

Education of the people in preventive medicine is coming to the fore, and as such offers outlet for creation of more income when the individual physician is prepared to give in value, that which the public now seeks in small measure but will demand in larger measure as time elapses.

For this the doctor *must* prepare himself individually by the acquisition of knowledge, and the few simple instruments necessary, and school himself in their uses.

In proportion as the physicians examine apparently healthy persons, and uncover the beginnings of diseases which will wreck vengeance on the human system later, and forestall such ravages by sound and honest advice, then in just such proportion will our State Health Department, Educational and Welfare groups and well meaning individuals have less need to awaken a health fear in our population, and the work of prevention will be done by each individual physician who will be paid therefor by his own retained patient, and not by the high powered, high salaried physician of any group.

Because of the physician of the present day and hour having been schooled in curative medi-

cine, he is loath to enter these new fields and is backward in accepting that which is being forced upon him, and in which much increased income is to be gained.

Dentists ethically send out a notice to their patients every three, six or twelve months "to keep your appointment to have your teeth examined, and so keep them in good condition if disease has started."

Perhaps the time is now here when a County Medical Society might send such a card each six months to each resident in the County, paying for the cost of a postal shower by assessment, or asking the local charity association interested in better health to do this.

The return would be at least 100% for the money invested, and would be scattered among the individual physicians, as it would come from their patients, and from some who has never seen a physician.

In some spots in this State I have found a physician, who is preparing himself to take up health examinations as a specialty, which is no more than advanced physical diagnosis, so soon as the campaign toward health consciousness is in full swing. He is forearming himself to the creation of new business, in his office, with less expense in overhead, saving of time to be devoted to other income producing things, and will take away from that physician who has not so forearmed himself, some of the latter's practice. It is inevitable—no matter how much the more poorly equipped, lazy and careless physician may howl. And as he takes away this work from other physicians, he is also reaping the benefits of the seeds which are being sown by those outside of the profession in creating this situation.

Carry this thought to its conclusion, where every doctor has a vast number of physical examinations to do each year, in his own office, for which he is paid, and in which he forestalls many predatory diseases, and we shall see better satisfied physicians with lessened mental worries and a better satisfied and healthier populace, with no pecuniary loss to the doctors of this or of coming generations.

Sickness, accidents, etc., there will always be, perhaps in lessening degree—but the creation of new income-producing avenues for the physician is of present vital import—and we see these avenues opening now, and must prepare ourselves to march down them, fully prepared to cope with whatever we may encounter.

Thus will we again regain confidence with our patients, see the cultists and faddists disappear through their own fallacious reasonings, and render to humanity that which is our duty.

JAMES N. VANDER VEER, President.

#### DR. ALBERT VANDER VEER

Dr. Albert Vander Veer died in his home in Albany on December 19, 1929, aged eighty-eight years, after a lifetime of leadership in the practice of surgery and civic medicine. He graduated from George Washington University in 1863, and served with distinction as surgeon in the Army of the Potomac during the Civil War. He served as President of the Medical Society of the State of New York, and as President of the American Medical Association. He was a Regent of the University of the State of New York from 1895 to 1921, retiring as its Chancellor. He was a man of broad learning and sympathies, and im-

pressed his pleasing personality upon the students in the Albany Medical College and on the physicians throughout the Nation To him more than any other physician was accorded the honor of the deanship of the medical profession of New York State.

Doctor Vander Veer's mantle of medical leadership has fallen on his three sons—Dr James N. Vander Veer, now President of the Medical Society of the State of New York; Dr. Edgar N. Vander Veer, now President of the Third District Branch of the State Society; and Dr Albert Vander Veer, Jr, of New York City

#### INDEXING MEDICAL SOCIETY ACTIVITIES

The official medical societies of the Counties, the States, and the Nation are practicing public health and civic medicine to an ever increasing extent. The record of this practice is found in the official Journals of the State Medical Societies, and seldom elsewhere. The NEW YORK STATE JOURNAL OF MEDICINE makes these records a prominent feature, and it also conducts a department called "Our Neighbors" containing reports from other State Journals and the Journal of the American Medical Association. A special index of these Medical Society activities was published in the Journal of December 15, 1929.

Following the precedent of last year, this index will be reprinted and a copy mailed to every Medical Library in the United States While it is true that indexes of medical journals are bound with the completed volumes, yet Librarians wish to have copies on file for quick reference without having to send to the stackroom for a number of bulky volumes It is gratifying to find that the Journals of Ohio and New Jersey have printed similar indexes and have filed copies with the Library of the New York Academy of Medicine. Other librarians will doubtless value the indexes of medical society activities

#### LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Conference Club: The officers of the New York State Medical Association met in the Yale Club, New York City, on December 20, 1901, and formed a conference club to meet three times a year, at a dinner, for the purpose of promoting acquaintanceship and friendliness among the officers and of exchanging ideas. Dr. E. Eliot Harris was the organizer and first president of the club. Concerning this club the New York State Journal of Medicine of January, 1905, quotes Dr. J. R. Goffe, President, as saying:

"Three years ago a club was organized win the Association, known as the Cautemet Club, the object being to consider, from the club is accorded to time, the interests of the Association and how they can be best subserved. It is accorded to all the subsect of the State, District Brand and Associations, and members the committees. The club meets the first the subsect of the State, District Brand and the subsect of the State, District Brand and the subsect of the State, District Brand and the subsect of the State, District Brand and the subsect of the State of t

## MEDICAL PROGRESS

Diagnosis and Clinical Forms of Extrasystolic Ventricular Arhythmia.--Dr. L. Gallavardin sums up an exhaustive article on this subject as follows: This form of arhythmia is most difficult to describe even though it possesses the traits of arhythmias in general. This difficulty of description is due in part to the fact that we do not know the exact origin nor the actual significance of extrasystolic accidents. All of these extrasystolic hearts, from those frankly sound to those gravely lesioned, may have their rhythm overlaid and as it were sprinkled with these ventricular extrasystoles and it is rather the clinical context than the study of rhythms and graphics which enables us to fix the semeiological value of the arhythmia. One may describe in schematic fashion and in the order of increasing gravity the benign arhythmias. the extrasystoles in volleys, the extrasystolic arhythmias which announce the slowly progressive cardiopathies, and the severe extrasystoles of grave cardiopathies which are often the prelude to fibrillation. The author gives 11 case histories which illustrate these different clinical types of extrasystolia. In the benign forms one should reassure the patient and may also prescribe such drugs as quinine, quinidine, salicylates, etc. Several drugs have some power over the symptom although not of course curative. Thus atropine may arrest the extrasystoles, but only for a short time. If there is an actual lesion of the heart digitalis will prove of value but if the condition is so serious that fibrillation is feared digitalis should be used with great circumspection for it can antagonize some symptoms while aggravating others. Injudiciously given it may aggravate the rhythmic disorder and perhaps precipitate fibrillation,-Le Journal de Médicene de Lyon, September 20, 1929.

Catheterizing the Right Heart.—Dr. W. Forssmann, in the search for some procedure less radical than intracardiac injection, proposes the sounding of the right heart through the veins and made various experiments on the cadaver to determine its feasibility. He passed a ureteral catheter along the various veins with the aim of locating possible val-vular obstruction, and also left the catheter in situ until the thorax could be laid open. He found a sound could be made to pass from the cephalic vein through the subclavian and innominate veins into the right heart, the left arm being preferable for the purpose. Volunteers then appeared among the author's colleagues and trials showed it was possible to introduce a No. 4 ureteral catheter into an elbow vein by means of a cannula and continue it for a distance of 35 cm. The author then made the experiment on his own person and passed the catheter a distance of 65 cm. before any resistance was encountered; this represented the space between the left elbow and the right heart. The location was checked up There were no unpleasant by röntgenograms. collateral or residual symptoms. The first opportunity for a clinical test was supplied by a case of peritonitis secondary to a ruptured inflamed appendix, with the patient in a desperate condition. Some blood was drawn from a vein at the right elbow and the catheter was introduced to the depth of 60 cm.—the arm having been elevated when resistance was felt at 30 cm. Glucose solution with suprarenin and strophanthin addition was infused for an hour with sensible improvement. This was temporary and the infusion was repeated without strophanthin. After a rally the patient succumbed 6 hours after the infusion was begun. The heart outlasted the respiration by. 6 minutes. Although the catheter had been constantly in position there were no evidences of mischief from this source. The author regards his method as safer than intracardiac injection for it eliminates the risk of pericardial shock and hemopericardium. One uses so to speak the natural passages.—Klinische Wochenschrift, Nov. 5, 1929.

The Treatment of Hyperpiesia.—A. H. Douthwaite states that each case of hyperpiesia must be treated in relation to the symptoms, signs, and causes of the condition. Exercise should be restricted only in so far as is indicated by the patient's symptoms and signs. A restriction of meat to thrice weekly is ample. Eggs, brain, liver, and fat should be largely excluded in an attempt to lower the cholesterol in the circlation. In the obese glutton the diet should be a rigid one, composed of fresh fruit and vegetables. The daily use of saline cathartics is odious and useless. Obstinate constipation responds to a vegetarian diet and non-irritating laxatives, such as sulphur, psyllium seeds, and mineral oil. As to drugs, the nitrites are useless except in emergencies. The iodides are not helpful in cases not associated with syphilis. Bromides are of value in the nervous type of patient. Thyroid extract is seldom helpful except in the obese menopausal patient. Veratrum viride is of undoubted value, but must be used with great caution. Acetylcholine stimulates the parasympathetic system and antagonizes adrenalin. It lowers arterial tension by producing dilatation of the arterioles, the capillaries being unaffected. Douthwaite uses a preparation consisting of acetylcholine hydrochloride with glucose. This powder is dissolved immediately before use and injected intra-musculary, the initial dose being 0.05 gram raised subsequently to 0.1 gram daily. This dose produces a steady fall in the systolic pressure, reaching its lowest level in three to four hours with a gradual return to its former height in eight or nine hours. With this treatment the heart and blood vessels are relieved of excessive stress for several hours daily, and the summation of such respites, taken over a year, represent an enormous saving of effort to the heart muscle. In advanced cases lowering of the blood pressure is, of course, contraindicated. Diathermy is sometimes of value. Venesection is still unsurpassed by modern measures in the obese florid type of man who will not submit to dietary restrictions and continuous treatment. Eliminative treatment is essential in the sallow toxic type of patient .--British Medical Journal, November 9, 1929, ii, 3592.

The Treatment of Pneumonia from the Point of View of the Circulation,—After showing in detail how the various factors involved in pneumonia conspire to impair the circulatory apparatus, John Brodie warns against meddlesome fussiness, which exhausts the patient and does much harm. Disturbing influences, like pain and insomnia, must be minimized. An opiate administered in the early days of the disease is a wise measure. Morphine should be replaced by a milder sedative after the fourth day of the disease. If, in spite of a mild diet, the abdomen shows signs of distention, only water and orangeade should be taken. · A simple enema should be given and a rectal tube inserted for removing flatus. If these measures are not effective an intramuscular injection of 0.5 to 1 c.c. of pituitrin should be given. There is good reason for the exhibition of digitalis as a routine measure to all patients with pneumonia; 45 to 60 minims of the tincture, or the corresponding dose of the powdered leaf, should be given daily until the fifth day, and then the amount reduced to 30 minims, avoiding the toxic effects of the drug. There is now a decidedly more favorable opinion than formerly in regard to the value of oxygen. Its administration cannot. however, be considered a therapeutic measure unless the inspired air contains from 30 to 60 per cent., and 40 to 50 per cent. seems to be the optimum dose in the average case. The nasal catheter method of Stokes is satisfactory in mild cases. For more severe cases a higher concentration is essential, and this can be best attained by means of an oxygen chamber, such as that of Barach. There can be no doubt that the effective administration of oxygen in ade-

quate dosage is supportive and tends to prolong life until the mechanism of immunity gains sufficient force to accomplish recovery. As to cardiac stimulants, the administration of fairly large and repeated doses of strong alcohol seems to be unscientific Strychnine exercises no specific action on the heart and as a respiratory stimulant it is unsatisfactory There is more reason in the use of adrenalin, but it must be given with caution, small repeated doses being safer than one large dose In acute emergencies it may be given intravenously; if this proves ineffectual, an intracardiac injection may be tried. Pituitrin is useful under similar circumstances, although rather less so than adrenalin,—Canadian Medical Association Journal, November, 1929, xxi, 5.

Soft Palate Symptomatology with Especial Reference to Tuberculosis .- Dr. Paul Neuda refers to his earlier papers beginning in 1923, in which he is seen to be the first to call the attention of the profession to this subject. His attention was first attracted to the symptom complex in question in 1921 and he has been able to isolate the following associations: In the blood states known as crythremia and polycythemia there may be abortive attacks in which only the soft palate is hyperemic, the balance of the oral mucosa having a normal The zone of junction between the hard and soft palates is the most involved-in other words the upper third of the soft palate. In icterus he has also found that the color, when the oral mucosa is involved, persists longer in the soft palate than elsewhere and especially on both sides of the raphe at the junction of hard and soft palates. In duodenal ulcer he has also noted in a number of cases the coincidence of polycythemia with hyperemia of the soft palate: and finally he has noted the presence of the symptom in the bronzing seen in certain diseases of the pancreas. In the cases of the above associations the gastrointestinal tract was the seat of various affections, but later the author's attention was attracted to tuberculosis of the lungs, larynx, etc. In the tuberculous subject the soft palate is peculiar in structure, being very delicately constructed, pale, and free from fat. In certain doubtful or complicated cases the condition of the soft palate was sufficient to influence the author's diagnosis. The pallor in these cases is associated with an anemic state of the entire gastrointestinal tract while the delicacy is due to the resorption of fat in the tuberculous .- Schweizerische medizinische Heceenschrift, September 21, 1929.

Syphilitic Pulmonary Granulosis. The difference of title refer to a luctic affection which services acute miliary tuberculosis of the limit authors have seen two cases which have been

most exhaustively studied; and both clinically and pathologically the diagnosis was tuberculosis. However when histological and bacteriological criteria were invoked the condition turned out to be syphilitic. The critical symptoms were the fever, dyspnea, and cyanosis and the cases ended fatally in from one to three weeks. However, a cured case has been reported by Professor Favre. This expression of syphilis has thus far been seen only in late and congenital cases. It has not been seen in the sound lung but thus far only in lungs with old pulmonary sclero-gummatous syphilis. There is nothing in the origin of these lesions which suggests the history usually found in acute miliary tuberculosis, in which affection the bacilli enter the blood stream from some remote and minimal lesion and are disseminated throughout the lungs; but there is a close parallel with those cases in which at the close of an ordinary caseous pulmonary tuberculosis terminal miliary granules are found scattered throughout the lungs. In the first case described the patient, two years after his chancre, developed what appeared to be a typical apical tuberculosis with hemoptysis and was interned in a tuberculosis sanatorium. No bacilli were found, and after the death of the patient the apical lesion was seen to have been a gumma. Clinically the miliary disease runs its course with all the malignancy of the corresponding tuberculous affection, death occurring from asphyxia. In Favre's recovered case the dyspnea and fever yielded promptly to antisyphilitic treatment.—Journal de Médecine de Lyon, October 20, 1929.

Is Measles Changing Its Type?—This question is at present agitating some of the German pediatricians, most of whom do not appear to believe that the disease has changed during the century, however individual epidemics may show departures from certain standards. One assertion has reference to diminished contagiousness and the non-necessity of notification. In the Deutsche medizinische Wochenschrift for Sept. 27, Noeggerath concedes that the first case in a family is not necessarily followed by others but this immunity is not necessarily a true one, for there may have been absence of the sort of contact which diffuses the disease. In rationalizing these apparent immunes the entire subject of exposure must be analyzed. The physician should at least continue the family quarantine by isolating the non-infected from the infected. Notification might be omitted save as part of a campaign to fight Moro in an article had an actual epidemic. noted in 1925 that some cases of measles exanthem were so atypical as to render diagnosis difficult. In such cases the incubation period was unusually prolonged-17 to 19 days. Also he noted that some exposed children escaped

in an astonishing manner. But he does not regard such behavior as anything more than variation within natural limitations. Fischl who first brought up this subject of modified measles saw in a recent Prague epidemic many cases of apparent immunity and many abor-The fear of measles pneumonia tive cases. does not seem so acute today as formerly, and recently our attention has been called to postencephalitis following Fischl himself writes a note in the same journal in which he claims that enough of his colleagues have made admissions to justify his bringing the subject to the attention of the profession.

Electrical Treatments in Acute Conditions. -C. B. Heald calls attention to the value of electrical treatments in acute conditions, such as pneumonia, peritonitis, and septicemia. Following the pioneer work of Eaton Stewart, the use of diathermy has now become a routine procedure in St. Bartholomew's and the West Middlesex hospitals. In the primary selection of electrical treatments in acute conditions, the first essential is to endeavor to visualize the actual pathological condition and the physical response most desired. It is desirable to eradicate all stimulative and irritative characteristics in certain types of currents, and to produce currents with true sedative effects. The direct current, with the technique which the author describes, can be used with benefit to reduce pain, spasm, and swelling in fractures and severe injuries. In acute poliomyelitis diathermy can be applied over the spine where the lesion is known to be, using a current of about one milliampere for twenty minutes, with electrodes 6 by 9 inches over the spine and the abdomen. In pneumonia, bronchopneumonia, and allied conditions, the author's experience has confirmed that of Stewart. To avoid moving or disturbing patients who are collapsed and suffering from difficult breathing the pads may be applied under the armpits. The treatment is usually followed by hours of quiet sleep, breathing becomes deeper and more physiological, and delirium frequently ceases abruptly. In septic conditions, such as peritonitis, septicemia, septic cavities, and osteomyelitis, ultraviolet light has a genuine field of usefulness. For burns extremely small doses of ultraviolet light from a full-sized mercury vapor lamp, at 30 inches distance, for two minutes, the burnt surface being covered either with liquid paraffin or ambrine and the remainder of the limb protected from the rays. Pain is more rapidly alleviated by this method than by picric acid, tannic acid, liquid paraffin, or ambrine alone, healing is more rapid and the resulting scar is better. Heald warns practitioners to be exceedingly careful to employ only those who

are thoroughly qualified to give electrical treatments in acute conditions—The Lancet. November 9, 1929 coxii 5511

Acute Yellow Atrophy of the Liver Caused by Acetylene Tetrachloride -- W Schibler re ports two cases of industrial poisoning which occurred in the Aarau Canton of Switzerland. the patients being women employees in a shoe manufactory The cases, in which full autop sies were held, upheld the teaching that this malady usually occurs in two distinct stages The first or prodromal stage is of variable duration and presents disturbances of the general health and of the gastroenteric functions, vomiting, slight fever and slight icterus The second period is one of nervous manifes tations, with motor unrest, screaming, delirium, and slight convulsive movements of the arms A mild soporous stage passes into deep and fatal coma-Icterus increases there is mirked fetor of the breath, with acute hemorrhagic diathesis and Babinski's toe phe The pulse is rapid but respiration is slowed. There is diminished liver dulness with tympanites in the epigastric region. In the cases reported neither leucin nor tyrosin appeared in the urine but the latter contained albumin and cylinders with biliary coloring matter. The blood was altered even to the naked eve, being yellowish brown and thicker than normal, the red cells numbered 6500000 with hemoglobin 120 A leucocytosis of 15,000 was present but the differential count showed no marked departure from normal Blood sedi The author mentation was much slowed knows of a third fatal case in another locality and abortive cases with joundice and marked prostration have been seen in the same factory and reported by Lejeune Acetylene tetra chloride is an ingredient of the glue used in shoe making. In this paper no evidence is given to inculpate it and in the second case none of the latter could be recovered by dis till ition of the blood and urine, although we have thus far no delicate tests to apply -Schweizerische medizimsche Wochenschrift, Oct 26, 1929

Hyperchrome Anemia in Intestinal Affections -H Glatzel alludes to the enterogenic theory of permicious anemia upon which, however, authorities differ widely. The author describes at great length a fatal case in a previ ously healthy man aged 54 with the picture of hyperchrome anemia-characteristic skin color, atrophy of the lingual mucosa achilia gastrica and anacidity, urobilinuria, retinal hemorrhages, dilatation of the heart, and the blood counts of permitious anemia. Death in blood counts of permeious memia this case had however been due to diverticulithis case had nowever men and purulent in history of concer in the ascendants and colregularities. A second patient, a woman of a real should not intermere. —Klu ischess find a fustory of multiple abdominal op-

tions-total extirpation of the uterus and tubes following gonorrheal infection appen dectomy, ileostomy for post operative ileus followed shortly by a second laparotomy with side to side unastomosis, a further laparotomy for post operative ileus with a second anasto mosis, and in operation for hernia this series of interventions she developed the picture of pernicious anemia and died with symptoms of extreme cachevia. Various cases are on record in which a picture developing af ter stenosis of the colon more or less recalled pernicious anemia, and the same is true of stenosis of the small bowel, resection of the same, enteritis etc In the author's case of diverticulitis the observation seems to stand ilone, for he has at least been unable to find a similar one in literature. In discussing diverticulitis in general he makes no mention of the theory that severe autointoxication of intes tinal origin has sometimes been associated with diverticulum formation. It is evident he implies that there are two schools of opinion on pernicious anemia, one of which adheres to a restricted view of an idiopathic affection while the second is wide enough to include cases secondary to bowel affections -- Munchener medizinische Wochenschrift, October 18, 1929

Prevention of Cancer - Prophylaxis, accord ing to Professor O Teutschlander, is applied ciology. It is usually assumed that it can be applied only to evogenous cancers in which evidences of a precancerous condition or chronic iritation are apparent and that this type of cancer is much more infrequent than the internal or endogenous type, but this the author denies, for enneer of the stomach, cer vix, etc. may be regarded as exogenous and he would reverse the common opinion by making the majority of cancers secondary to irritative factors. The first step in prophylaxis is obvious-removal of such irritating novae as are apparent to us, or if this be impossible render ing them innocuous. Under this head come all occupational cancers and organized prophyl axis of industrial diseases should, of course take care of this group. The second step in prophylaxis is the extirpation of all precen cerous lesions whether or not due to the chronic application of an irritant. In many cases surgical removal is indicated on general principles and without any bearing on cancer Many of these affections are of congenital origin and belong under mulformations, while others like leucoplakin are required as a result of sustained irritation. The author does not believe that an undue susceptibility to cancer can be antagonized by diet, hygicne, or drugs, and our only hope from general prophylaxis hes in eugencies, for men and women with

#### GRANT C. MANDILL—OUR CANDIDATE FOR REGENT

The Legislature of the State of New York will presently find itself faced with the duty of filling the vacancy in the Board of Regents caused by the recent resignation of Walter Guest Kellogg.

The importance of this great body and its vital relation to the medical profession are so well known to every member, as to obviate the neces-

sity of extended comment.

The members of the State Board of Medical Examiners are appointed by the Regents. The Regents have the power to remove any of the examiners for misconduct, incapacity or neglect of duty. The Regents are the head of the Department of Education and have the power to appoint and at their pleasure to remove the Commissioner of Education. The Regents also have the power to appoint and at their pleasure to remove a deputy Commissioner of Education, who shall perform such duties as the Regents may assign to him. Though the Commissioner of Education has the power to appoint assistant commissioners, he can do this only "subject to the approval of the Regents." This provision applies likewise to the appointment and removal of "all other needed officers and employees of the State Education Department." The Regents have the power to appoint the members of the Grievance Committee upon the nomination of the various medical societies. They have likewise the power to remove any member of the Grievance Committee after due hearing, for malfeasance in office or neglect of duty. After the Grievance Committee has found a physician guilty of the charges preferred against him, it must transmit to the Education Department the record, findings and determination wherein and whereby such practitioner has been found guilty, together with their recommendation. It is then the duty of the Regents, after due hearing, in their discretion to execute an order accepting or modifying the determination of the Grievance Committee. Thus, in the most intimate and direct way the practice of medicine is regulated and controlled by the Regents of this state.

Section 51 of the Education Law provides,

among other things:

"Conformably to law the regents may supervise the entrance regulations to and the licensing under and the practicing of the professions of medicine, dentistry, veterinary medicine, pharmacy, optometry and chiropody, and also supervise the certification of nurses, public accountants, certified shorthand reporters, architects, and members of any other profession which may

hereafter come under the supervision of the head of the board of regents."

The Board of Regents are the governors of the University of the State of New York, an institution conceived and set up by Alexander Hamilton. So important is this body that it finds express recognition in the Constitution of our state. Article 9, Section 2 of that Constitution provides:

"The corporation created in the year one thousand seven hundred and eighty-four, under the name of The Regents of the University of the State of New York, is hereby continued under the name of The University of the State of New York. It shall be governed and its corporate powers which may be increased, modified or diminished by the Legislature, shall be exercised by not less than nine regents."

The objects of this institution are stated in the Education Law as follows:

"\* \* \* to encourage and promote education, to visit and inspect its several institutions and departments, to distribute to or expend or administer for them such property and funds as the state may appropriate therefore or as the university may own or hold in trust or otherwise, and to perform such other duties as may be intrusted to it."

By statute it is also provided that

"The university shall be governed and all its corporate powers exercised by a board of regents whose members shall at all times be three more than the then existing judicial districts of the state. The regents now in office and those hereafter elected shall hold, in the order of their election, for such times that the term of one regent will expire in each year on the first day of April, and his successor shall be chosen in the second week of the preceding February, on or before the fourteenth day of such month. A regent shall be elected by the legislature, on joint ballot of the two houses thereof.

"All vacancies in such office, either for full or unexpired terms, shall be so filled that there shall always be in the membership of the board of regents at least one resident of each of the judicial districts. A vacancy in the office of regent for other cause than expiration of term of service shall be filled for the unexpired term by an election at the session of the legislature immediately following such vacancy, unless the legislature is in session when such vacancy occurs, in which case the vacancy shall be filled by such legislature."

It would be idle to attempt within the compass of this editorial a full statement of the vast powers and jurisdiction with which the Board of Regents, from the time immenorial, have been vested by statute. The Board of Regents is an institution as old as the state. The roll of its membership from the beginning is a catalog of eminent and distinguished men. The most outstanding characters in all the professions and walks of life have given of their time and strength to this great institution. Not only as physicians having a direct interest in this body, but as citizens alert to the interests of the commonwealth, it should not only be our duty, but our great pleasure to exert the concerted and united influence of our Society in furtherance of

the appointment to the present vacancy of a man who would measure up in all respects to the high traditions of the office; who possesses that breadth of knowledge and training which qualify him for it and that confidence of his conferers in his profession and of the citizens at large which should render his appointment a distinguished acquisition to an honorable body. Such a man is Dr. Grant C. Madill, of Ogdensburg, who resides in that part of the State in which a vacancy now exists. His appointment would be an honor to the Medical Profession; and the people at large would have reason to thank the physicians for their splendid contribution to the public service.

#### KELOID - CLAIMED NEGLIGENCE IN INJECTION PRIOR TO TONSILLECTOMY

In this case a small boy was brought to the doctor's office by his mother for examination of his tonsils and adenoids. The doctor examined them and found them to be diseased and recommended their removal. The mother consented and the child was brought to the doctor's office for that purpose. The doctor being apprehensive that the boy might be a bleeder, decided to give him an injection for the purpose of coagulating the blood. The syringe and needle were sterilized. The needle was a new one and had only recently been purchased from a reputable manufacturer. The needle was a proper one for the purpose for which the doctor was about to use it. After the needle had been sterilized and inserted in the ampule of medication, the doctor had the boy stand up while he held his arm and his nurse held his body, while the mother stood by. Both the boy and the mother were cautioned that the boy should not move while the injection was being made. Nevertheless, just as the doctor inserted the needle into the flesh about half way between the elbow and shoulder at a time when the needle was penetrating the muscles, the boy jumped and wrenched his arm, thus causing the needle to break, about three-quarters of the needle remaining in the muscles. The doctor immediately made an incision about one-half inch long at the point where the needle had broken, and probed for it, but could not locate it. He then immediately took the boy and his mother to a hospital where an x-ray was taken of the boy's arm, and a physician at the hospital under a general anaesthetic removed the needle. In the removal an incision was made in the boy's arm about two inches long and several sutures were put in where the incision was made. The boy's arm was bandaged and he went home. The physician who took the needle out treated the arm for about a week, In healing the arm developed a keloid where the incision was made.

An action was thereafter commenced against the physician who made the injection in which it was claimed that the doctor negligently caused the needle to break in the boy's arm and further that he used a defective, broken and rotten needle, and failed to inspect the same before injecting it.

The case came on for trial and after the close of the plaintiff's case, the court on our motion dismissed the action, thus terminating it in the doctor's favor.

The state of the s

## NEWS NOTES

#### COUNCIL MEETING

The second regular meeting of the Council of the Medical Society of the State of New York was held on December 12, 1929, in the offices of the Society in the New York Academy of Medicine, with twenty-three members present and the President, Dr. J. N. Vander Veer, in the Chair.

The principal business was the reception of reports from the Chairmen of the Commit-

tees both standing and special. The Council voted that the Journal publish the report of the Committee on Public Health and Medical Education, and that part of the Report of the Executive Officer relating to county societies.

It being the fifty-second anniversary of the birthday of the President, a resolution was adopted felicitating Dr. Vander Veer on his activities and friendships.

#### COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

Report to the Council, December 12, 1929

December 12, 1929.

Continuing its former policy the Committee's major activity has dealt with graduate education. Since the last report to the House of Delegates the following courses have been given under the direction of the committee:

Rockland County, Tuberculosis, 4 lectures; Wayne County, Surgery, 6 lectures; Ontario County, Surgery, 6 lectures; Washington County, Internal Medicine, 6 lectures; Tioga County, Traumatic Surgery, 5 lectures; Steuben County, Internal Medicine, 6 lectures; Monroe (with Livingston), Heart Disease, 5 lectures; Genesee (with Orleans and Wyoming), Heart Disease, 5 lectures; Sullivan County, Internal Medicine, 6 lectures.

It will be seen from this report that nine courses were given this fall reaching twelve counties. The course in Rockland County was given in cooperation with the State Department of Health through its' Division of Tuberculosis. The State Department of Health paid part of the expenses of this course. Unfortunately, this course had to be given in the summer which probably made the attendance smaller than it should have been although the attendance was most satisfactory. The committee feels that the course in Tuberculosis is an excellent one for many county societies. The Division of Tuberculosis of the State Department of Health is to be complimented on the splendid cooperation evidenced in arranging this course.

A new course on Traumatic Surgery arranged by Doctor Moorhead of New York City was given in Tioga Cunty Doctor Moorhead selected an excellent cup of lecturers and they presented their subject most instructively to the Tioga County Medical Society. The Secretary of the Tioga County Medical Society on November seventh wrote the following letter: "Am writing to tell you how we all enjoyed the lectures on Traumatic Surgery you sent our Society. You can recommend this group of men to any society. The same subjects given by other men might not be so good but these men were all splendid." The attendance at this course was small in numbers but large in proportion to the county membership, the percentage of attendance being 78.

It will be noted that of the nine courses given this fall, six dealt with medical subjects and three with surgical. The committee is pleased that the county medical societies prefer the medical subjects which, undoubtedly, are those upon which the average practitioner needs further enlightenment, although the general surgical course and the course on Traumatic Surgery as outlined by Doctor Moorhead cover only the most practical matters.

Our Committee submits the following summary of the work done during the fall of 1929: Total number of courses ...... Total number of lectures ..... 49 Number of county medical societies before which courses were given ..... Total attendance of all courses ............1623 The largest attendance for one course (Monroe County) ..... 841 The smallest attendance for one course (Rockland County) ..... Total cost of all courses .........\$1,745.38 Average cost per course ..... 193.93 Average cost per county ...... 145,45 Average cost per attendance .......

In preparing the summary it was necessary to estimate figures for the past four lectures in the Sullivan County Course which will not be com-

pleted until December 11th and figures for which have not been reported to the Chairman's office.

The Council's attention is called to the rather low expenditure which the committee has made this fall notwithstanding the fact that slightly more work has been done than last fall. This has been possible by grouping nearby counties in taking the same course on the same day, one in the afternoon and one in the evening which has largely reduced traveling expenses. Committee has also been fortunate in securing excellent lecturers who in most cases resided rather close to the place in which the lecture was given. The lecturers were teachers representing the following institutions; Columbia University. Cornell University, New York University, Post-Graduate Hospital Medical College in New York City, Rochester University, Syracuse University and Yale University.

The Committee has already started preparations for some of the spring courses; namely, courses in Chemung, Jefferson and Saint Lawrence Counties. It also has requests for courses in the following counties; Onondaga, Oswego, Delaware, Schoharie, Otsego and Clinton. Several other counties are considering the possibility of having a course. Three counties which had courses this fall have presented requests for

courses in the fall of 1930.

This Committee has cooperated actively with the special committees on Periodic Health Examinations and Physiotherapy both of which subjects were under the direction of this committee last year. A considerable amount of correspondence has been carried on between the Chairmen of these Committees and the Chairman of this Committee. The Chairman of this Committee also attended a meeting of the Committee on Periodic Health Examinations on September 20th.

The Committee has under consideration with the Division of Tuberculosis of the State Department of Health plans for interesting county medical societies in a study of mortality rates for tuberculosis and the need of further efforts to control this disease. This need is apparently much more acute in certain counties than we realize at the present time.

The Committee has sent requests to each county society for information regarding their public health activities. Seventy-five per cent of all county societies have responded. An analysis of these replies will be discussed at the meeting of this Committee to be held in January.

For some time there has been a tendency on the part of the House of Delegates to create special committees to consider specifically certain single subjects many of which have had to do with Public Health. The wisdom of such action is not doubted. However, it would make the work of the State Society more efficient if this committee was kept in closer touch with the work of these special committees. This has been especially shown in the close cooperation between the special committees on Periodic Health Examinations and Physiotherapy, and the standing committee on Public Relations with this Committee. The Committee on Public Health still feels that the medical profession has not mastered the problem of Diphtheria Immunization any place near to its satisfaction. However, because of the fact that a special committee has to deal with this subject we do not know how far we are to proceed with it and still follow the instructions of the Council or the House of Delegates. A meeting of the Committee will be held in January to discuss largely these various Public Health questions already alluded to and in addition the subject of Maternal Mortality, and the organization of County Health Departments, the latter to be worked out in conjunction with the Public Relations Committee. At this meeting it is also planned to take under consideration what changes, if any, should be made in the Committee's policy of Graduate Education.

THOMAS P. FARMER, M D., Chairman. .

#### COUNTY SOCIETY ACTIVITIES

Report of the Executive Officer, Dr. J. S. Lawrence to the Council, December 12, 1929

Herewith is submitted a brief survey of the activities of thirty-nine County Societies as recorded in the office of the Executive Officer. Unfortunately, this is not complete, owing to our difficulty in keeping in close contact with the officers of the County Societies, and some of the information may not be stated correctly because it has been taken from the newspapers. We shall greatly appreciate receiving corrections or additions from any Secretary.

Albany County has just completed a he week program, in which the County Society an active part. Last year, as an innovation Society held one monthly meeting at each of three hospitals. The staff of the hospital acras host, supplied the program.

The Allegany County Society is taking an tive interest in and has appointed a committee assist with the children's clinics that are beheld in the county. It also has requested t

board of supervisors to provide a room to be used for the detention of patients to be committed to the state hospital.

The Bronx County Society has a very active Committee on Medical Economics, which has held a conference with representatives of insurance carriers and self insurers in the county, and contemplates further conferences of the same character. It has secured the establishment in the Bronx of a special Bureau of the Workmen's Compensation Commission.

The Broome County Society, in conjunction with the Binghamton Academy of Medicine, is about to give a series of six talks to the Kiwanis Club on health subjects. After the Club has had talks from other groups, a second series of health talks is to be prepared. They are also planning for themselves a week of symposia, a particular subject to be taken up each day and visitors invited to open the discussions.

The Cayuga County Society supervises the activities of its very efficient county laboratory and recently stimulated a campaign for a new tuberculosis hospital.

The Chenango County Society is taking an active part in the erection of an addition to the Chenango Memorial Hospital.

The Clinton County Society has a committee to study the maternal and pre-natal work done in the county. It recently passed a resolution asking for increased financial support of the efficient county laboratory.

The Columbia County Society, at its most recent meeting, passed a resolution endorsing the appointment by the board of supervisors of two additional public health nurses, and another resolution opposing any fixation of medical fees by the state.

The Cortland County Society has sponsored the creation of a county health department, which the board of supervisors has authorized.

The Delaware County Society proposes to hold this coming spring, at least six clinics "which will deal with diseases and problems of interest to the people and medical profession of the county."

The Dutchess-Putnam Society has a very active Public Health and Public Relations Committee. It is considering, with the assistance of voluntary agencies, the high infant mortality in the county, and it has recently been asked to give an opinion to the board of health on the wisdom of establishing free periodic health examination centers.

The Erie County Society has directed local agencies in an intensive public health campaign against cancer. It has been conducting a radio lecture program and has assisted Dr. Fronczak, Commissioner of Health of Buffalo, with an anti-diphtheria campaign.

The Fulton County Society enjoyed a unique

program at a recent meeting. They invited a banker and a broker to address them on the subject of "Finance."

The Greene County Society is attempting to stimulate interest in the erection of a county hospital. A small fund for that purpose is available.

The Kings County Society is making a study of the necessity of medical examinations and health guidance of boys in vocational schools, and is stimulating an anti-cancer campaign.

The Lewis County Society has been taking an active part in a campaign for a county hospital, which resulted in a vote of two to one by the people of the county, authorizing the board of supervisors to appropriate \$80,000.00, to be met by a similar amount from the state, for the erection of a county hospital.

The Madison County Society, by resolution, recently requested the board of supervisors to employ four additional county public health nurses.

The Monroe County Society is busily engaged in perfecting plans for the entertainment of the State Society at its annual meeting, June 2-5, 1930.

The Nassau County Society has a full-time executive secretary. Some of his duties are to assist with the collection of accounts and to act as a liaison with voluntary agencies in promoting diphtheria immunization and anti-cancer programs.

The five County Societies of Greater New York are actively promoting a periodic health campaign and a diphtheria immunization campaign. In addition, the New York County Society is very effectively conducting a publicity bureau which is receiving widespread approval. Its Committees on Civic Policy, Medical Economics, and its Special Committee on Dispensaries, are very active.

The Oneida County Society, in conjunction with the County Committee on Tuberculosis and Public Health, is promoting a periodic health examination campaign. In connection with this, the members of the Society are lecturing to workmen in the various industries:

The Onondaga County Society is actively assisting in a diphtheria immunization campaign.

The Ontario County Society has recently secured, through the board of supervisors, an appropriation for the employment of a county school medical inspector.

The Orange County Society appointed a committee to meet a committee of the board of supervisors for the purpose of studying the administration of the new Public Welfare Law. This committee made its report to the County Society and the board of supervisors, recommending that in the administration of the law, the family physician be given preference when medical aid is

sought. The board of supervisors adopted the recommendation and by resolution recommended to the towns that no physicians to the poor be appointed; that in every instance the family physician be employed under the same conditions as he might have served had the patient sought him directly. It is hoped that the physician's charges will be rendered in the same spirit. The County Society has also appointed a committee to investigate the prevalence of heart disease in the county.

The Otsego County Society recently held a special meeting to discuss economic problems.

The Queens County Society is building a very fine home. It has for several years cooperated very effectively and satisfactorily with the Queensboro Tuberculosis Committee.

The Rensselaer County Society has recently established a physicians' exchange and is cooperating with the Chamber of Commerce in creating a credit association. It has appointed a certified milk commission; is actively cooperating with the County Tuberculosis and Public Health Association in promoting periodic health examinations; and is considering the employment of an executive secretary.

The Rockland County Society is considering the creation of a county health department.

The St. Lawrence County Society is urging the employment of additional public health nurses.

The Saratoga County Society has made a medical examination of the school children of the county and at its last meeting appointed a committee to appear before the board of supervisors, asking its cooperation in the creation of a public health council to be composed of four physicians and three lay persons, the president of the County Society to be chairman of the committee and the three lay persons to be the judge of the children's court, the commissioner of education of the county, and a member of the board of

supervisors; and to petition them to appropriate \$25,000.00 to carry out the health program which they have developed, a part of this \$25,000.00 to be spent in the employment of four public health nurses.

The Schoharie County Society sponsored a

public meeting on cancer.

The Steuben County Society has cooperated with Dr. Allen Freeman in making a public health survey of the county.

The Suffolk County Society conducts one of the best anti-tuberculosis campaigns in the state and has a county health department with unusual features. The Society acts in an advisory capacity to the county board of health. It has also endorsed an anti-cancer campaign and the examination of the eyes of school children.

The Sullivan County Society is cooperating most effectively with the county health association in promoting a health education program.

The Tompkins County Society is considering the creation of a county health department.

Tioga County has had no hospital. The Medical Society has taken the initiative in securing one, which is being built at present in Waverly.

The Ulster County Society is stimulating haste in the construction of a county tuberculosis

liospital.

The retiring president of the Washington County Society, Dr. W. S. Bennett, delivered an exceedingly interesting and instructive address before his Society on the subject of "Economic Changes During the Past Century and How They Have Affected the Physician." He limited himself in the discussion to conditions in his own county. The address was carried in full by a number of the newspapers in his county and in neighboring counties, and was the occasion for two very splendid half-column editorials. It deserves to be considered a County Society activity.

The Wyoning County Society is interested in having the supervisors and state convert the Warsaw Hospital into a county hospital.

#### COUNTY SOCIETY ACTIVITIES RECORDED IN THE JOURNAL

Supplementing the report of Dr. Lawrence on the records of the civic and community activities of County Medical Societies on file in the office of the Executive Officer, the editors have studied the county society records that have been printed in the JOURNAL during the past year

The officers of thirty-two county societies sent reports of their societies during the year 1929 These reports are principally on the subject of the business, scientific and social work of the societies; but in addition practically every society has considered some topic having a civic or community relation, similar to those recorded in the report of Dr. Lawrence. However, the records

of the civic activities of the county societies received by the JOURNAL directly from the counties, has been meager, as is shown by the following index:

Ulster, Discussion of physical defects of
school children

Many references to the civic activities of county medical societies are contained in the reports and addresses of the officers and committeemen of the State Society; but it is a fact that the total number of references recorded in every way is probably only half of the number that are not recorded at all, and which do not reach either the executive officer or the editors.

The JOURNAL is almost the only repository of the records of the civic activities of county societies. An investigator of the year 1979, reading the JOURNAL, would get the impression that the members of the county societies of the year 1929 were not very active in the discharge of the peculiar civic duties which devolve upon the medical profession.

The editors wish to call the attention of the leaders of the county societies to the opportunities for mutual helpfulness which will come from a full record of every activity of every society.

#### THE COMMITTEE ON PHYSICAL THERAPY

The Committee on Physical Therapy, appointed in accordance with the resolution at the 1929 Annual Meeting of the Society, consists of the following members: Richard Kovacs, M.D., Chairman, New York City, Floyd O. Reed, M.D., Yonkers, Philip L. Forster, M.D. Albany, Walter J. Craig, M.D., Albany, Homer J. Knickerbocker, M.D., Geneva, Guy H. Turrell, M.D., Smithtown Branch, Lee A. Hadley, M.D., Syracuse.

The first meeting of the Committee was held in Albany on September 5th, in the Legislative Bureau of the Society. Besides the members of the Committee, Dr. Vander Veer, President of the Society, and Dr. J. S. Lawrence, Executive Officer, were present. The Committee realized that in the field of physical therapy there exists considerable confusion, due to the rapid development of the use of physical measures during the past few years, and the lack of fundamental knowledge on the part of the medical profession thereon, and also due to the unfortunate injection of a physiotherapy clause in the new Medical Practice Act which gives lay people the right to practice physical therapy as a craft. The Committee, therefore, decided first to make a survey of the existing facilities for graduate and post-graduate instruction, and to encourage the further development of these facilities and inform the medical profession about them. The Committee went on record as disapproving courses sponsered by commercial interests such as manufacturers of apparatus and lecturers not under the auspices of a recognized medical institution. The Committee decided also to inform the Secretaries of all County Societies and the Chairman of the Committee on Public Health of its work and to offer them its advice on all problems pertaining to physical therapy. The Public Health Committees were asked to designate one or two members as a Sub-Committee on Physical Therapy. The Committee also decided to publish within a reasonable time a detailed statement as to the general statue of physical therapy for the information of the medical profession of New York State.

It was decided to study also the question of physical therapy in relation to compensation work, and to make cooperative efforts to this effect with the insurance companies. Dr. Homer J. Knickerbocker, of Geneva, was appointed to study this problem. The Committee also recommended that the program of the next Annual Meeting of the Society should contain papers spreading practical knowledge on the subject of physical therapy.

The status of the licensed physiotherapists (physical therapy technicians) was discussed, and the Committee expressed its opinion that the requirements of the existing law as to the preliminary four years study as a basis for admission for examination, and as to a subsequent real examination, should be enforced; and, finally, that the missing provisions for censuring technicians and revoking their licenses in case of violations, should be supplemented.

Future meetings of the Committee are to be

held monthly on first Thursday afternoons, alternately between New York and Albany,

and, possibly later, further up-State.

The October meeting of the Committee was held at the New York Academy of Medicine on October 3rd, with Dr. Kovacs presiding and Drs. Reed, Turrell, Forster and Craig present. Replies were read from several County Societies, notably, New York, Bron, Kings, Nassau, Orange, Jefferson and Lewis, stating that they had appointed Committees on Physical Therapy. There were also reports received from various medical schools as to the existing of physical therapy. The Committee decided that one of the later meetings should be given over to a conference with the Education Department of New York State, especially to discuss the status of the physical therapy clause and also educational activities. Complaints as to objectionable courses of teaching held by a commercial concern were referred, through the Secretary of the State Society, to the Council on Physical Therapy of the American Medical Association, for further investigation.

The November meeting of the Committee was held at the Legislative Bureau of the Society in Albany, on November 7th. Besides the members of the Committee, Dr. Vander Veer, President of the Society, attended the meeting, Responses from several County Societies were presented, and it was decided to ask Sub-Committees on Physical Therapy to make a survey of physical therapy activities in their communities, especially in reference to institutional work; and that these committees also be informed that regional conferences with them will be held beginning with the new year.

The Chairman reported about a conference with the Medical Department of the Department of Labor, and a subsequent arrangement for a joint meeting with the members of the New York Claim Association with this Committee, this meeting to be held at the New York Academy of Medicine on December 6th.

The Chairman reported that the draft of the statement on the status of physical therapy is ready and will be sent out for further study and approval to the President of the Society and to all members of the Committee, and for their correction before being published

The Committee endorsed a resolution from the Special Committee on Physiotherapy of the Medical Society of the County of New York, reporting violations of the Medical Practice Act by persons operating as licensed physiotherapists, and calling for a more thorough supervision of these individuals and establishments, and recommending a strengthening of the provision of the law to meet these alleged

illegal operations, was endorsed.

The conference meeting with the insurance carriers was held on December 6th at the New York Academy of Medicine, at which there was an attendance of forty, and at which it was the consensus of opinion that the status of physical therapy in compensation work is unsatisfactory and serves neither the real interest of the patient nor that of the medical profession and the insurance company. A joint committee of six, in which the insurance carriers and the State Society are equally represented, was empowered to take up the details of this problem, and after finishing its survey to make definite recommendations at anotherlarge joint meeting

RICHARD KOVACS, M.D., Chairman.

#### TRI-STATE CONFERENCE

The thirteenth meeting of the Tri-State Conference was held on Saturday morning, December 7, 1929, in the Hotel Chelsea, Atlantic City, beginning at 10:30 o'clock. There were present from New Jersey President A. F. McBride, who presided; Vice-President G. N. J. Sommers; Secretary J. B. Morrison: Executive Secretary and Editor H. O. Reik, and Past-Presidents E. R. Mulford and Philip Marvel.

From Pennsylvania, President W. T. Sharpless; President-Elect R, V. Patterson; Secretary W. F. Donaldson, and Editor Frank Hammond

From New York, President J. N. Vander Veer; President-Elect W. H. Ross; Past-President James E Sadlier; Executive Officer J. S. Lawrence, and Executive Editor Frank Overton.

The principal subject of discussion was "Profitable Results Accruing from the Four Years'

Existence of the Tri-State Conference." The results were set forth by Dr. Reik in a paper which he had prepared. Doctor Reik first described the personnel of the Conference, and its objectives as set forth in the first call for organization. He also rehearsed the ten subj which had been discussed at the Conferences

After this preamble Doctor Reik discussed progress which New Jersey had made along lines of the ten subjects in which the New Jer State Society obtained help from the Tri-Si Conference, as follows:

1. Medical Laws: New Jersey being ingewith the value of those of New York,

2. Nursing: A realization of the unserth. of training and the service renderal?

3 A diphtheria campaign "

Jersey with less labor and cost and more hope of success because of what New Jersey had learned from New York.

4. Periodic health examinations: New Jersey will avoid waste of effort by observing what the

other states are doing.

5. In the Workmen's Compensation Law, New Jersey has learned little from the other states but has contributed much to them, for the outstanding influence of President MacBride in the field is universally recognized.

6. Relation to Voluntary Health Agencies: New Jersey is encouraged to establish a Welfare Committee in every county, after the New York

plan of a Public Relations Committee.

7. Graduate Education is being established under the administrative leadership of Rutgers College after a practical failure of other plans.

8. Expert medical testimony: A model law has been endorsed by the New Jersey State Medical

Society and the State Bar Association.

9. State control of private hospitals: A law for that purpose was enacted by the influence of Commissioner Ellis.

10. The Journal: The ideals of Pennsylvania set forth by Editor Hammond are kept constantly in mind.

The paper of Doctor Reik was the plea of an advocate for the Tri-State Conference. The paper of the next speaker, Dr. W. H. Ross, was the charge of the judge who had studied the subject impartially. Doctor Ross stated that he had formed his opinion after reading the stenographic reports of all the twelve meetings. He had not found that the subjects discussed by the Conference had been settled, nor could they be in the changing conditions of medical service; but the discussions had great value as stepping stones.

The Conference had wasted time on topics which belonged to other bodies,—the nursing, topic, for example. On the other hand the Conference had omitted subjects which are of the deepest concern to all the officers of State Soci-

eties, two of which are

1. Expenditures and their object;

Trustees and their field in planning future activities of the State Society.

Settle the broad questions, and the minor ones will settle themselves. Expert testimony is only a minor question which the Bar Association should settle.

The State Journal is the greatest subject before the Tri-State Conference. If the managers of each journal think they have the best publication, there is no use in a discussion of the subject. Where shall the journals get advertisements? If the Conference can't agree on this question, it is futile to waste money and time on its discussion.

Doctor Ross made a plea that the Conference produce practical results, quoting from an editorial in the Pennsylvania State Journal: "The value of the Conference depends on how much can be carried away from it." He suggested that the subject for consideration be presented briefly and concisely by a chosen speaker, and that the discussion be of the nature of a round-table on that particular topic.

Doctor Vander Veer suggested that the Tri-State Conference adopt a program of subjects for the three conferences of the year. He also was in favor of publishing the entire stenographic notes of each conference in the Journal.

Doctor Sadlier said that he valued the proceedings of the Tri-State Conference so much that, like Doctor Reik, he had collected them into a volume. The question of state aid to general hospitals in rural counties is now being considered in New York State, and the Tri-State Conference can aid New York if Pennsylvania will tell its expenses along those lines. Regarding the practical value of the conference, Doctor Sadlier said that he had got both inspiration and information from every one. Although some impractical things had been discussed, yet the general results were valuable.

Doctor Lawrence spoke of the random nature of much of the discussion at the Tri-State Conference, and gave as an example his paper on "The Opportunity of the County Society" when he made some definite suggestions which went entirely unnoticed in the discussion, while the speakers talked on subjects which were foreign to his paper.

The readiness with which a discussion may be sidetracked was illustrated by the morning conference at which the speakers in the general discussion devoted about half their time to subjects apart from that announced on the program, among them being the following:

Reporting county society meetings.

2. Reciprocity of licensure between Pennsylvania and New Jersey.

3. Post-graduate instruction.

4. Control of irregular practitioners.

The impression gained from the discussions from the floor and from conversations, both before and after the meeting, was that the Tri-State Conference could be of great value to the leaders of the three State Medical Societies in two ways:

- 1. Acquaintanceships formed.
- Information exchanged.

Both of these objects could be best promoted by informal, round-table discussions rather than general papers. The present Conference is practically another medical society where long, formal papers are presented and discussed. It would be more practical to conduct a round-table discussion and to hold each speaker down to the subject under discussion.

A second number on the morning program was a paper by Mrs. Taneyhill on her work in popular medical education. Mrs. Taneyhill has been in the employ of the New Jersey Medical Society for three years as Doctor Reik's assistant in lecturing to groups of laymen. She first tried the plan of arranging lectures through county medical societies, but only a few had asked for them.

She next cooperated with the Women's Auxiliaries; but this Fall she had lectured principally to school children, filling engagements arranged by the State Commissioner of Education and the County School Commissioners.

The Conference adjourned at quarter past one and the members were entertained at luncheon by the Medical Society of New Jersey.

#### ANNUAL REGISTRATION

The time is at hand for the annual registration of physicians in accordance with Section 170 of the Practice of Medicine Act which was passed in 1926 at the request of the Medical Society of the State of New York. This law has frequently been quoted as a model on which other States are basing legislation.

The following letter from the representative of the University of the State of New York will

be of interest to every physician.
Albany, N. Y., December 16, 1929.

Dear Editor:

May I call the attention of your readers to annual registration? As you know the law provides that physicians should register with this Department between the first day of October and the first day of January. At this writing more applications have been received than at the same date in previous years, but there are still approximately over 5,000 physicians out of approximately 18,500 who have not sent in their application cards. The Department is extremely reluctant to use the powers given it by law to compel registration, and hopes that the physicians of the State who have not already done so will send in their application cards immediately.

Your cooperation in this matter will be very

much appreciated.

CHARLES B. HEISLER, Assistant in Higher Education.

#### WESTCHESTER COUNTY HEALTH DEPARTMENT

The New York Times of December 27, 1929 states that the Board of Supervisors of West-chester County has voted unanimously to establish a County Health Department, which shall include all that part of the County which lies outside of the four cities—Yonkers, White Plains, Mount Vernon and New Rochelle. The

estimated cost of the County Health Department will be \$100,000 of which the State will contribute one half. Westchester adjoins Greater New York and is therefore in the Metropolitan area. Its population in 1920 was about 350,000 of which considerably over one-half was in the four cities.

#### REDUCING DRUGS

Reduction of weight is now a popular fad, and inquiries come to the Medical Information Bureau regarding the safety of various methods of losing flesh. Answers to the following letter will assist the Bureau to answer the questions:

Dear Mr Editor:

The Medical Information Bureau of the Academy of Medicine and the County Medical Society is eager to secure information with reference to the deleterious effects resulting from the use of patented reducing drugs, such as Marmola, Nutroids, etc. Needless to say, the information asked for is such as physicians can give without violence to the confidential relationship between patient and physician. Any information on this item will be keenly appreciated

> IAGO GALDSTON, M.D., Secretary, Medical Information Bureau,

## THE DAILY PRESS

#### PRISON RIOTS

Something is wrong in prison managements when an epidemic of riots can suddenly occur, and when two can break out in the Auburn State Prison within six months. It is a striking fact that the State authorities should treat the riots largely as a medical condition and should send two physicians to have charge of the whole matter-Dr. Frank L. Christian, Superintendent of the State Reformatory at Elmira to have charge of Auburn Prison during the emergency, and Dr. George F. Chandler, of Kingston, to make an investigation into the causes of the riots.

The report of Dr. Chandler was made public on December 20, and the New York Herald Tribune of that date summarizes the doctor's recommendations as follows:

"Foremost among seven recommendations made by Colonel Chandler is the abolition of the Mutual Welfare League, which was established at Auburn in 1913 by the late Thomas Mott Osborne and now has a branch at Sing Sing.

"The six other recommendations by Colonel Chandler in his report are:

"Immediate relief of overcrowding at Auburn prison, with use of the state fair grounds at Syracuse as a possible solution.

"Increase of the guard force by at least fifty, with a course of training before assuming duties, and selection to be taken from the civil service and placed in the hands of the Department of Correction.

"Sufficient civilian employees to handle the mails, telephones and the state's money.

"Better food and more clothing.

"Abolition of all special privileges.

Cartoon from the New York Herald Tribune of December 17, 1929.

"Provision for segregation of prisoners.

The New York Herald Tribune had anticipated Dr. Chandler's report when on December 17 it printed a cartoon showing a prisoner haranging his associates about luxuries that are demanded by the enforced guests of the State.

#### THE PECCADILLO

A peccadillo is the microbe of a little sin or had habit to which children are especially sensitive. James J. Montague warns against it

"The peccadillo is so small It hardly can be seen at all. Just one or two, or even three, Can do no harm to you or me. But even germs, unless they throng In herds a hundred thousand strong, Are powerless to make one ill Despite their base and evil will. The germs evade the questing eve. But multiply and multiply Upon your clothing and your meals Until they lay you by the heels.

in the following instructive verses from the New York Herald Tribune of November 19, 1929:

And so the peccadillo may Become a patriarch some day. Until along with it you'll find A whole collection of its kind Intent to make of you a wild And rather good-for-nothing child. And so if peccadillos lurk Around you when you play or work, Unless you are a little dunce You will get rid of them at once, And men will praise a few years hence Your industry and innocence."

#### HEALTH RHYMES

We do not think much of health rhymes until we are confronted with convincing evidence that they actually do have a favorable effect on the health habits of children. But there are various kinds of health rhymes. The New York Sun of December 2 printed some origin il jungles founded on the following news item.

on the following news item
"Miss Mary Duggan of Feachers College
wants childhood rhymes that will substitute

Mistress Mary, healthy very,
How does your garden grow\*
With spinach greens and pers and beins
And rhubarb plants all in a row

There was an old woman who lived in a shoe She had lots of children who healthfully grew She fed them on onions raw fried and boiled, And thus were all germs that beset children foiled

Little Polly Flinders
Sat among the cinders
Warming each pretty little toe
Her mother fed her beet tops
And now whene'er the heat drops
Her blood's so rich she sits out in the snow

Bye baby bunting, Diddy's gone a-hunting Lo get some dindchon greens So baby'll know what vigor means

Jack Sprat could cit no fat, His wife was like her mate Their idea of a banquet was A vegetable plate

Curly Locks! Curly I ocks! Wilt thou be minc?
Thou shalt not wash dishes Nor yet feed the swine,
But sit at the table
And have for desseit
I lot of broccoli
Including the dirt

healthful foods to: those about which the old jingle authors wrote?

The Sun intended that the verses should be tunny, for it printed them in its joke column. We showed them to some mothers who had small children and to our surprise both the mothers and the children thought them to be both funny and serious. We are therefore reprinting them as either fact or funcy,—take your choice.

Simple Simon met a pieman
Going to the fair
Said Simple Simon to the piemin
"For pie I never care"

Said the pieman to Simple Simon With a silly grin (ach), "I ve only pics," and Simon gasped And mumbled, "What! No spinach?"

Sing a song of sinpence, A pocket full of rye, Four and twenty blackbirds Baked in a pie

When the pie was opened
The children all did sing
"Never mind the nice part—
We want a neck or wing!

The Queen of Hearts
She made some tarts
All on a summer's dis
The Knave of Hearts
It stole the tarts
And ate them right iwas

The King of Hearts
Cilled for the tarts
The Queen she used her heid,
Unto the King
She had them bring
Some succotash instead

Old Mother Hubbard
Went to the cupboard
To make her dog sit up and beg,
But when she got there
Of bones it was bare,
So the doggie got spinish and egg

## Z/Z

## BOOKS RECEIVED

- Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.
- A Graphic Guide to Elementary Surgery. By Prof. Dr. Th. Naegeli. Translated by J. Snowman, M.D. Octavo of 206 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$5.00.
- Applied Electrocardiography. An Introduction to Electrocardiography for Physicians and Students. By Aaron E. Parsonnet, M.D., and Albert S. Hyman, A.B., M.D. Octavo of 206 pages, illustrated, New York, The Macmillan Company, 1929. Cloth, \$4.00.
- THE DOCTOR IN COURT. By Edward Huntington Williams, M.D. 12mo of 289 pages. Baltimore, The Williams & Wilkins Company, 1929. Cloth, \$3.00.
- Memoranda of Toxicology. Partly Based on Tanner's Memoranda of Poisons. By Max Trumper, B.S., A.M., Ph.D. Second Edition. 16mo of 214 pages. Philadelphia, P. Blakiston's Son & Company, 1929. Flexible leather, \$1.50.
- RECENT ADVANCES IN PULMONARY TUBERCULOSIS. By L. S. T. BURRELL, M.A., M.D. Octavo of 217 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$3.50.
- THE PRACTICE OF REFRACTION. By W. STEWART DUKE-ELDER, M.A., D.Sc., M.D. Octavo of 410 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1928. Cloth, \$4.00.
- RECENT ADVANCES IN OPHTHALMOLOGY. By W. STEWART DUKE-Elder, M.A., D.Sc., M.D. Second Edition. Octavo of 405 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$3.50.
- SQUINT: Its Causes, Pathology, and Treatment. By CIAUD WORTH, F.R.C.S. Sixth Edition. Octavo of 246 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$3.50.
- Medical Clinics of North America. Vol. 13, No. 2, September, 1929. (Chicago Number.) Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues). Cloth, \$16.00 net; paper, \$12.00 net.
- DISEASES OF THE CHEST AND THE PRINCIPLES OF PHYSICAL DIAGNOSIS. By GEORGE WILLIAM NORRIS, A.B., M.D. and HENRY R. M. LANDIS, A.B., M.D. Fourth Edition. Octavo of 954 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1929. Cloth, \$10.00.
- THE TREATMENT OF DIABETTS MELLITUS WITH HIGHER CARBOHYDRATE DIETS. A Textbook for Physicians and Patients. By WILLIAM D. SANSUM, M.S., M.D., PERCIVAL A. GRAY, Ph.D., M.D., and RUTH BOWDEN, B.S. 16mo of 309 pages. New York and London, Harper & Brothers, 1929. Cloth, \$2.50. (Harper's Medical Monographs.)
- CLINICAL MEDICINE FOR NURSES. By PAUL H. RINGER, A.B., M.D. Third Revised Edition. 12mo of 330 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, \$3.60.
- THE NUTRITION OF HEALTHY AND SICK INFANTS AND CHILDREN for Physicians and Students. By E. NOBEL,

- C. Pirquet and R. Wagner. Second Revised Edition. Authorized translation by Benjamin M. Gasul, B.S., M.D. Octavo of 243 pages, illustrated. Philadelphia, F. A. Davis Company, 1929. Cloth, \$3.50.
- THE AFTER-TREATMENT OF OPERATIONS. A Manual for Practitioners and House Surgeons. By P. Lockhart-Mummery, F.R.C.S. Eng. Fifth Edition. 12mo of 281 pages. New York, William Wood & Company, 1929. Cloth, \$3.25.
- On Prescribing Physical Treatment. By Matthew B. Ray, D.S.O., M.D. (Edin.) Octavo of 179 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$3.75.
- DISEASES OF THE STOMACH. A Text-book for Practitioners and Students. By Max Einhorn, M.D. Seventh Revised Edition. Octavo of 593 pages, illustrated. New York, William Wood & Company, 1929. Cloth, \$6.00.
- Interns Handbook. A Guide to Rational Drug Therapy, Clinical Procedures and Diets. By Members of the Faculty of the College of Medicine, Syracuse University. Under the direction of M. S. Dooley, A.B., M.D. 16mo of 254 pages. Philadelphia and London, J. B. Lippincott Company, 1929. Cloth, \$3.00.
- International Clinics. Edited by Henry W. Cattell, A.M., M.D. Thirty-ninth Series, Volume III. Octavo of 308 pages, illustrated. Philadelphia and London, J. B. Lippincott Company, 1929.

- AN INTRODUCTION TO THE STUDY OF HUMAN ANATOMY. By ROBERT JAMES TERRY, A.B., M.D. Octavo of 345 pages. New York, The Macmillan Company, 1929. Cloth, \$3.50.
- A System of Bacteriology in Relation to Medicine. By Various Authors. (Prepared under the direction of the Medical Research Council.) Volume III. Octavo of 413 pages, illustrated. London, His Majesty's Stationery Office, 1929. Cloth, £8-8-0 a set; £1-1-0 each.
- Gastric and Duodenal Ulcer. By Arthur F. Hurst, M.A., M.D., and Matthew J. Stewart. M.B. (Glasg.), F.R.C.P. Octavo of 544 pages, illustrated. London and New York, Oxford University Press, 1929. Cloth, \$20.00.
- Applied Pharmacology. By A. J. Clark, M.C., B.A., M.D. Third Edition. Octavo of 529 pages, illustrated. Philadelphia, P. Blakiston's Son & Company, 1929. Cloth, \$4.00.
- SURGICAL CLINICS OF NORTH AMERICA. Vol. 9, No. 5. October, 1929. (Philadelphia Number.) Published every other month by the W. B. Saunders Company, Philadelphia and London, Per Clinic Year (6 issues). Cloth, \$16.00 net; paper, \$12.00 net.

#### BOOK REVIEWS

HANDROOF OF PHYSIOLOGY BY W D HALLIBURTON M D, and R J S McDowall. M B D Sc F R C P Eighteenth Edition Octave of 902 pages illustrated Philadelphia P Blakiston's Son & Company 1920 Cloth \$475

This volume represents the 1928 revision of what his been known since 1896 is Halliburton's Physiology? Some idea of the excellence of this work may be gauged by the fact that in 29 years seventeen editions totalling one hundred and sixteen floursand copies were published. The present edition measures up to the high standard set

by its predecessors and has for a co author R J S McDowall the Professor of Physiology at Kings College London

The general plan and make up of the hook follow the truditional scheme found in most physiology texts. The basic anatomy and detailed function of the general and special org ins of the body are presented and in addition there are chapters on such subjects as Conscious Activity, and The Physiology of Conscious States. So ne of the sections have been almost entirely rewritten for this edition.

Additions have been made to the chapters on the Polygraph The Formation of Blood and Bile Blood Groups etc so as to bring the volume abreast of the recent advances that have been made in the climical and laborators phases of medical science

FRANK & MAILON

HANDIOOK OF ANISTHETICS BY J STUART ROSS MB ChB and H P FARLIE MD Third Edition 12mo of 339 pages illustrated New York William Wood & Company, 1929 Cloth \$325

Those of us will read the first edition of this book

Inose of us will again appreciate the author's lucid style and his careful descriptions and explanations. He shows a wide acquaintance with the literature and his catholicity by quotitions from American journals and modestly lets his own long experience form the backbone of the book without insisting overnuch upon his own opinions as authoritative. After all there is not so much difference in the principles of scientific mesthicis as there is the possibility of conflicting opinion in varying methods. Most of us will agree with the cau tious upproval of Levy's positive recommendation of Chiloroform and agree with Russ that there is a place for it in combinations and if employed at all that in telligent and uncersing care must be exercised.

The American reader will have to interpret and qualify this essentially English volume in the light of our own practices. Of the 66 illustrations we would recog nize only five and they not of latest models of apparatus Gwathmer is credited for his Colonic and Synergistic inethods Crile's almost forgotten Anoci mesthesia is approved Louckhardt and Herb of course for their work with Ethylene the little used Fudo trached method of Elsberg with illusion to Meltzer and Auer the Wayo men and their technic in Local Anesthesia about include all the cis Atlantic references. One may be pardoned for a smile at his apology to nurse techni cians for including them in the male pronouns chapter on Local and Spinal Anesthesias might well have been omitted because of the meagerness of the dis cussion. We have half a dozen volumes devoted to these subjects alone. Ross is profitable reading because one feels the author's rersonality and is impressed by the worth whileness of his statement opinion and argument. He is a safe guide because he knows the way and can point it out

THE PRINCIPLES OF CHINICAL PATHOLOGY IN PRACTICE A Guide to the Interpretation of Laboratory Investigations for the Use of Those Engaged in the Practice of Medicine By Geoffree Bourne M.D. (Lond), M.R.C.P. and Kenneth Stone M.D. (Oxon), M.K.C.P. Octavo of 392 pages. New York Oxford University Press. 1929. Cloth \$4.75. (Oxford Medical Publications)

In the Principles of Clinical Pathology in Practice' Bourne and Stone have attempted to present the resources of the laboratory in a way intended to be of special value to the practitioner. The book embodies a consideration of lal oratory information from the point of view of direct application of the information derived by laboratory examinations to the patient. Technique is not described and as is stated in the preface, Facts likely to be of assistance to the clinician have been included facts unlikely to be of use have been excluded.

A very useful treatment of the subject is attained by classifying the material according to disease and under the latter specifying the laboratory findings together with their interpretation. A fairly complete bibliography is given the illustrations are adequate. The contents are up to date and complete. The style is simple concise and unusually clear. For the busy doctor whose activities prevent intimacy with the laboratory its methods and close requirintance with its usefulness, and resources this little volume of 374 pages will prove unusually The specialist be he surgeon or internist profitable also will find in it much of practical value and perhaps arrive at a quicker understanding of much that is re quired or passed over by occasional reference to this book MAX LEDERER MD

DISEASES AND DEFORMITIES OF THE SPINE AND THORAX BY ARTHUR STEINBLER M D Quarto of 573 pages illustrated St Louis The C V Moshy Company 1929 Cloth \$12.50

In the preface the author states that he has endeavored to develop the topic coherently and logically by dwelling on basic theoretic and experimental evidence. He has succeeded well in doing so

The book is different from the average medical text book where the material is digested for the reader. The author tells his story coherently he gives authoritative opinions on disputed points and expects the reader to draw his own conclusions. He wishes the reader to do his own digesting and in that way develop orthopedic judgment or orthopedic conscience, as he calls it

The subject is presented in a scholarly and masterly manner with a wide scope. It includes concential and static deformities scoliosis low back pain tuberculosis tractures and dislocations osteomyelitis syphilis chronic arthritis tumors and a synopsis of the anatomy of the spine.

It is distinctly a very valuable contribution. It is especially valuable because of the large list of bibliographical references.

The book should be in the library of every orthopedist and industrial surgeon but is of doubtful value to the general practitioner

## OUR NEIGHBORS

#### SECRETARIES' CONFERENCE IN NEW JERSEY

The December issue of the Journal of the Medical Society of New Jersey contains the full stenographic report of the proceedings of the Conference of County Secretaries and Reporters which was held on November 6, 1929, in Trenton, and which was attended by representatives from fourteen out of the twenty-one counties of the State. It is interesting to note that this was exactly the same proportion that attended the conference of New York Secretaries in 1926, but is more than that of the New York conference of 1929 when 32 out of the 60 county societies were represented (see N. Y. STATE JOURNAL OF MEDI-CINE. October 1, 1929, page 1212). Concerning the attendance the New Jersey Journal of December says editorially:

"Unfortunately, we are compelled to say of this gathering as we do of the majority of medical organization meetings, that it was not as well attended as it should have been. Seven counties, just one-third of the whole number, were not represented. Of the 37 individuals serving as secretaries or reporters to the 21 county societies (5 counties elect the same man to fill both offices) only 18—just one-half of the whole—participated in the conference. We wish somebody would tell us why."

The New Jersey report covers fifteen pages, but the following abstracts will show the nature of the discussions:

The first speaker was Dr. W. H. Ross, President-elect of the Medical Society of the State of New York. Dr. Ross founded his remarks principally on the activities of the New York State Medical Society where he formed his opinions and conclusions after first-hand experience. He spoke of the public character which has developed in medicine in the last decade; the relations of the medical profession to other agencies; and the adjustments which doctors have to make in order to meet the new conditions. He then described the work of the Committee on Public Relations of the Medical Society of the State of New York. and of medical service along preventive lines. He urged the physicians to recognize the necessity of lay health organizations, but advised the physicians to assume the leadership in preventive medicine and public health by means of their county medical societies. He particularly commended the Bergen County Medical Society for its medical publicity by means of paid advertisements in the daily newspapers of Hackensack.

The opinion of the remarks of Dr. Ross held

by the New Jersey secretaries is indicated by the following editorial comment:

"Dr. Ross finds that there is some justification for the complaint that some of our number are incompetent practitioners because of failure to keep step with advancing medical science, and also for the public discontent arising from the fact that the profession as a whole has not kept pace with a rapidly changing world by greater practical application of its increased knowledge in the field of scientific medicine. Both findings are quite in line with what the officers of our state society have been constantly preaching for several years past, and some of the other suggestions in his paper are deserving of special consideration."

Dr. S. T. Snedecor, Secretary of Bergen County Society, described the publicity work of his County Society and said:

"Regarding the publicity campaign in Bergen County started a year ago, perhaps the advertising is the part of it that is best known, but I would not have you think that the advertising overbalances the other activities of the county medical society. One of the things I started the first year that I was secretary was a monthly 'Bulletin,' giving the programs of meetings and telling in detail of our activities so that each man in the society would know what was going on, what meetings were being held, what correspondence was taking place, and what the state society was doing for us. It solves many prob-There are no long-winded discussions of misunderstandings at the business meetings, and the members always come ready to push things because they know in advance what is going on.

"We had to raise the dues this year for the state society, so we boosted that along with the county work. It cost us \$5 to run our routine activities, and the county society voted \$25 dues so that we can have some money for the 'Public Relations' work."

"As to the results of our advertising, I'm sure that the doctors have done twice as many health examinations this year as during the previous year. As for the rest of it, I think Dr. Ross' speech has shown us the need for this type of work, this sort of intangible need which you cannot measure."

"A word about this year's program: We do not feel that anything we have done is of a set nature. Some of our advertisements were in the form of an experiment. We have a local

## COMMON SENSE in a Cough Syrup

INSTEAD of the awe-inspiring formula of the old-fashioned cough syrup,

## THATE

brings a common sense composition of four synergistic drugs to your service, to effect quick relief.

Thiate is a new, pleasant tasting cough syrup, which demonstrates its efficacy in a hurry. In this modern cough syrup Potassium Guaiacol Sulphonate has been combined with Benzocaine Benzoate, Sodium Mono-Benzyl Succinate, and Sodium Salicylate.

Now Thiate does not choke up a cough temporarily. It treats hacking, distressing paroxysms by loosening the secretions and aiding in their smooth expulsion.

A common sense way to find out if this is so is to try Thiate on one cough. Let us send you a bottle, with our compliments, for the test.

#### Comfort and Support with New Inner Pad Belt

Where scientific abdominal uplift and support are desired, this new Camp Inner Pad Belt (Model No. 913) serves admirably. With the Patented Adjustment attached directly to the soft inner pad, the beli provides for correct upward and backward support. This Adjustment makes manipulation easy and a stronger pull possible. The outer elastic section controls extra adipose tissue. The Inner Pad Belt insures maximum comfort with proper support. Dealers stocking these items add a service which customers will appreciate . . . and, at the same time, increase profit possibilities. Sold by surgical houses and the better drug stores.

radio station which has given us choice broadcasting hours, 12:30 noon on Sundays, for about 6 minutes; we do not want too long a time. The advertising is placed in seven papers in the county. Broadcasting is really of a personal nature and I think the man's name should be used. I believe we are getting away from the old fashioned idea that we should not use a man's name in this connection. All the newspapers have consented to save space each week to print the radio talk. So we make of it a general publicity program. We are, in addition, having reprints made of those advertisements for distribution throughout the county. If you need money, here is one way to get it: The Tuberculosis League sent us \$200 and offered to distribute reprints and assist in every possible way. We are organizing a speakers' bureau. We intend to keep on with our advertising in much the same form. This month we will join the New York campaign and advertise public health examinations. We keep a directory, from time to time listing the towns and the men eligible to practice, teaching the people who the local The whole program is interestphysicians are. ing, and we feel that the results are very fruitful. It is in line with the message Dr. Ross has given us today and we welcome any other suggestions This work is not at all complete, we are really just beginning it."

Dr. J. B. Morrison, Secretary of the State Society, described the publicity work conducted by Dr. Reik and Mrs. Taneyhill. Concerning

crippled children he said:

Cooperation has come also from the Commission for Crippled Children. We did not accept kindly the first draft of that law, and one of our chief criticisms was the fact that the Commission was given the power to take out of the hands of an ordinary physician any case of a deformed or crippled child that the Commission thought was not receiving proper treatment. We now think the law as passed is one of the greatest advances that was ever made. Doctors are now represented on that staff by those who will see that justice is done every time; but they think first of the welfare of the child, and if he is not receiving the most scientific, modern, up-to-date treatment, they feel that they have a right to advise the Commission to take him out of the hands of his physician."

Concerning lay health organizations, Dr. Morrison said:

"Dr. Ross spoke of cooperation of the medical profession with social organizations. The social medical organizations, you know, are here to stay. A great many of them are led by teachers who have taken a university course in social work. They are actually giving up their lives to social welfare work. They are pioneers and know what

they want and are going to get it. They have the power and influence and, what Dr. Ross did not tell you, they have almost unlimited funds. They really have the public welfare at heart and the medical profession can no longer hang back, as it has in the past, and withhold the assistance that these organizations are craving. You may say you haven't the time nor the money. I had neither the time nor money when I started in as secretary of your society, but I saw what was needed for the profession and that unless we woke up to a realization of the fact that we were in a changing aspect of medicine, that medicine would be so changed in the next twenty years that we would not recognize it; and that unless we tried to solve these problems through the medical profession we would have lots of time to sit around in our offices and with far less money to spend."

The next paper on the program was by Dr. B. F. Buzby, of Camden County, on the subject "The Relation of the Secretary to His Own Society." He spoke of the relation of officers to one another, the making of program, delegates to neighboring societies, collection agencies, and qualifications for membership in county societies.

Several subjects were brought up in the general discussion. Eligibility to membership was

expressed by Dr. Morrison as follows:

"Regarding this membership drive, I feel that the province of organized medicine is to bring within our folds every reputable physician who has not proved himself to be disreputable. We have conditions in our county societies where one doctor scarcely recognizes the other for some personal reason, perhaps, but they are both members of the society and deriving the benefits therefrom. I know other instances where thoroughly good men have been kept out because of some personal grievance on somebody's part. The greater influence you bring to bear upon these men the better, and whether they will attend the meetings or not is for them to decide. Let them pay their dues and you can get along without them if they do not want to attend, but I believe organized medicine should offer membership to every reputable physician in the state."

The work of the Program Committee was described by Dr. Irvin of Atlantic City, as follows:

"From what I have heard, I guess our society is the only one that does not have a program committee; that function is taken over by the president and has worked out very well. We always have some well-known man from the outside as speaker. Of course, we have had no trouble in getting them to come to Atlantic City; one of the hotels, where we hold our evening meetings, very kindly entertains them without cost."

Tenure of office was described by Dr. Lathrope of Morris County, as follows:

#### DIET QUESTIONS have GELATINE ANSWERS

# HOW CAN YOU MAKE A DIABETIC KEEP TO HIS DIET AND ENJOY IT? . . .

As every physician knows, ordinary everyday hunger has a way of complicating the diabetic diet problem. The memories of patients are notoriously short—and it is often easy to forget the diet when the appetite craves something "good to eat"!

Knox Sparkling Gelatine has the double faculty of providing dishes that are "good to eat"—and also dietetically correct for diabetics.

Knox Gelatine, being real gelatine—free

Knox Gelatine, being real gelatine—free from sugar, coloring and ready-prepared flavoring—combines delightfully with the foods most commonly prescribed for diabetics: eggs, cream, meat, fish, vegetables and fruits. Moreover, it multiplies the forms in which these foods may be presented, bringing to the diabetic menu a tempting variety that will please the most jaded appetite.

May we send you the recipes contained in the Diabetic Recipe Book, prepared by an eminent dietitian? If you will clip the coupon below we shall be glad to send you this book by early mail.

KNOX GELATINE LABORATORIES 432 Knox Avenue, Johnstown, N Y.

Please send me, without obligation or expense, the booklets which I have marked. Also register my name for future reports on clinical gelatine tests as they are issued.

"I think the secretary's job should be a more or less continuous one, also the treasurer's and reporter's. When chosen I said I would take the position of secretary for five years, and at the end of that time I shall resign because I think there are other men in the society who can and should do the work and I do not think it should be saddled on one man for too long a time. I also think it is better for the society to have a change occasionally. This is, however, merely a personal opinion and the society may feel differently about that in some cases. I think it is a good plan to get men in, particularly the men who sit around and growl. They should be given something to do. Generally, if a man criticizes he is thinking about things and that is the sort of man you may want to get on the job. I know of one instance where a man was a chronic kicker, but made one of the best officers that society has had for a long time, when he was put in as president.'

Dr. Diverty of Gloucester County described a local organization of physicians as follows:

"I have been a member of our society for 42 years and during that time there have been many changes. The difficulty with us is to get our men to attend meetings. Some of us attend regularly, but many will not come out. The question is how can we make it interesting for them? belong to a local organization in Woodbury to which every local physician belongs. We call it the Physicians' Association, and it has been in existence continuously for twenty years. I don't believe there is any other such organization in New Jersey. We have practically a 100% attendance. The thought has come to me-why not apply this rule we have followed there to our country society? Once a month we go alphabetically down the list and have a meeting at the home of some member who gives us a dinner. At first we called it the Protective Association. but have changed the name as that did not sound very elevating. We keep a list of every man in the community who does not pay his bills. We agreed among ourselves that if such a man is making good wages and applies to us for services, we will refuse to attend him unless he pays us in advance."

Collecting bills was described by Dr. Pinneo, Essex County, as follows:

"As to the matter of collections, three different schemes have been considered in our county. 1 learned that the City Bank, in New York, which is the second largest financial organization in the world, had a small loan plan and that the doctors were using it, so I proposed to our bank that it should organize the same plan—that the bank shall make loans to patients, without collateral. on endorsement to us. Then the patient is paying

## PUBLIC RELATIONS COMMITTEE OF NEW JERSEY

The Medical Society of New Jersey has a committee on Public Relations, although it is called the Welfare Committee. It consists of thirty members. An organization meeting was held on October 27, 1929; and its proceedings were reported in the December Journal.

The first subject discussed was the work of Mrs. Taneyhill in popular medical education, consisting principally of lectures to school children.

The Committee also has charge of graduate education, and expects to institute courses early in the year with the assistance of Rutgers College.

Mental hygiene clinics were described as follows:

"The proposed establishment of mental hygiene clinics throughout the state was discussed by the House of Delegates and by the Pediatric Section of the state society in June. As the question was presented in the House by the Committee on Public Health and Sanitation, the society instructed that committee to continue its work. In the Pediatric Section a special committee, under the Chairmanship of Dr. E. C. Jackson, was appointed to aid in the development of plans presented by Dr. Plant. We are informed by Dr. Jackson that his committee has been enlarged to relude members having expert knowledge of this

subject and that arrangements are being made for cooperation with the committee on Public Health and Sanitation and also with the State Department of Institutions and Agencies. Dr. Jackschas also requested, and the Editor has grante the request, space in the Journal for 'a series of monthly articles starting with the a, b, c's of mental hygiene, and gradually increasing the dosage in successive articles up to the point of saturation.'

The committee also expects to take up the promotion of legislative plans for establishing standards of surgeons and other specialists, sub-committee was appointed to consider the matter.

The committee will appoint a subcommittee investigate the subject of fee splitting and oth unprofessional conduct.

Cooperation with the Pharmaceutical Association in medical legislation has been partly a ranged. This action was approved.

Concerning collection agencies, the committee reported:

"During the past year there was much ta about the difficulty encountered by physicians collection accounts and expression given to muc dissatisfaction with collection agencies. TI Journal has carried two special articles explaining
